

Module 04  
**Advanced  
Shapes**  
CS 106 Winter 2019

*Hollow* by Eva Hild

```
void setup()
{
    size( 400, 800 );
    background( 80 );
    rectMode( CENTER );

    fill( 200, 200, 240 );
    stroke( 150, 50, 50 );
    strokeWeight( 5 );

    ellipse( 200, 170, 140, 180 );
    rect( 200, 400, 180, 140 );
    line( 100, 550, 300, 750 );
}
```

```
void setup()
{
    size( 400, 800 );
    background( 80 );
    rectMode( CENTER );

    fill( 200, 200, 240 );
    stroke( 150, 50, 50 );
    strokeWeight( 5 );

    quad( 115, 80, 115, 260,
          270, 160, 250, 100 );
    triangle( 110, 330, 110, 480,
              300, 480 );
    bezier( 100, 550, 300, 550,
            100, 750, 300, 750 );
}
```

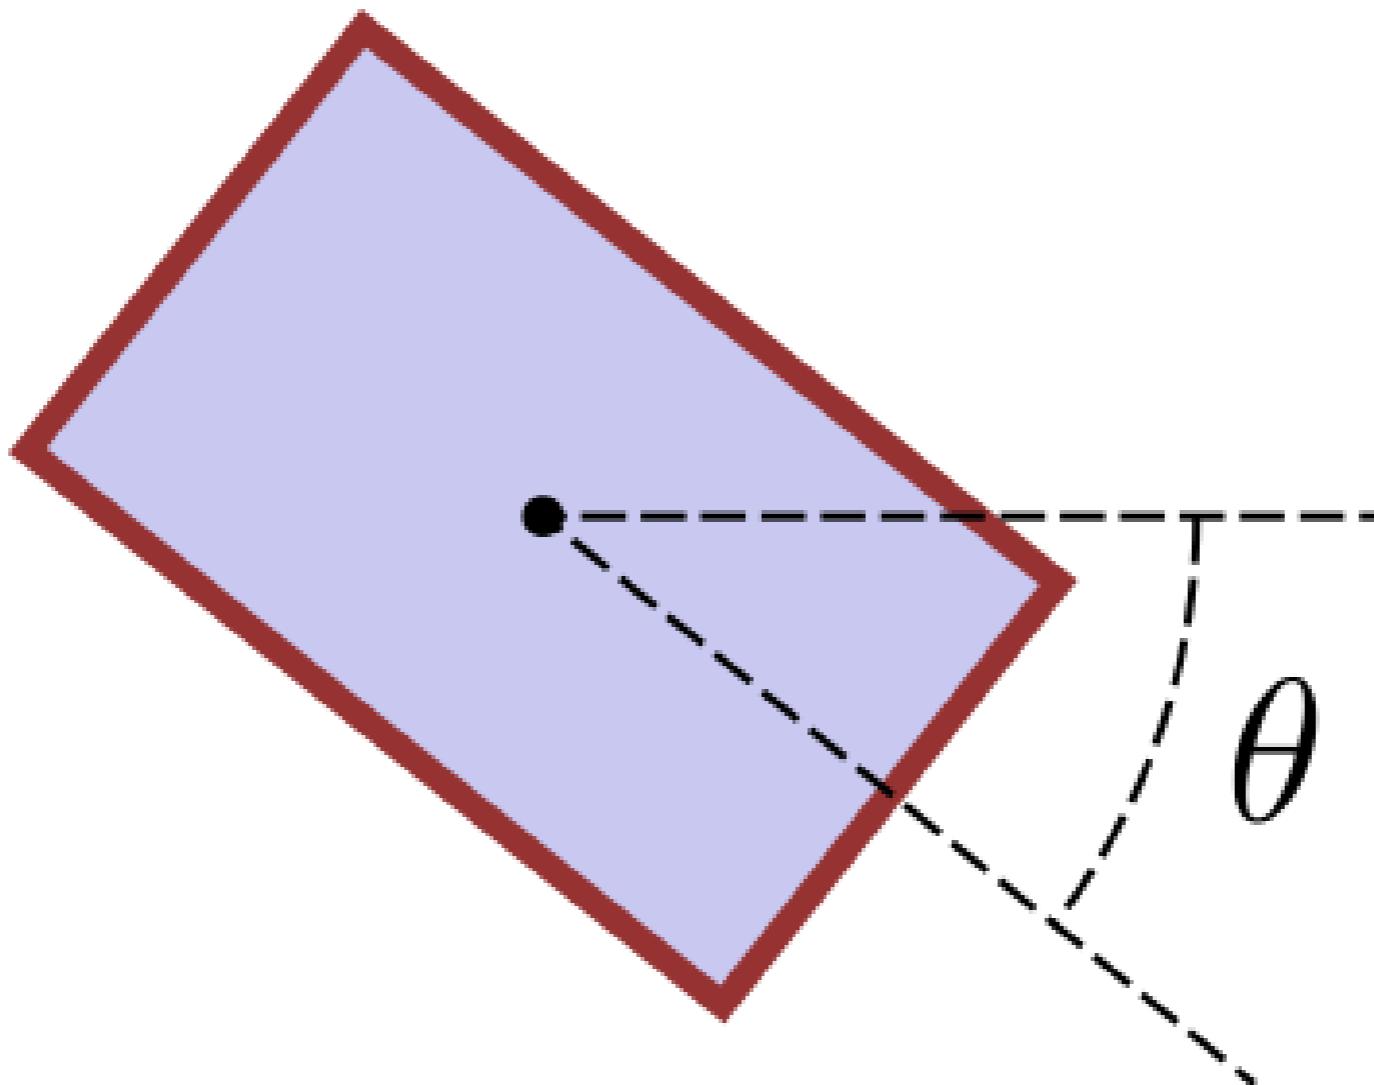

```
void setup()
{
    size( 400, 800 );
    background( 80 );

    fill( 200, 200, 240 );
    stroke( 150, 50, 50 );
    strokeWeight( 5 );

    for( int idx = 0; idx < 5; ++idx ) {
        rect( 100, idx * 160 + 20,
              200, 120, idx * 10 );
    }
}
```

# Sea Ice Index

**NOTICE: Sea Ice Index now Version 2.1. [Read more...](#)**

[Animate Monthly Images](#)   [Compare Anomalies](#)   [Compare Trends](#)   [Documentation](#)   [FAQ](#)   [Data Archive](#)

## Sea Ice Index Data and Image Archive

Here you can access the archived monthly and daily Sea Ice Index images and data as well as the input data that the Sea Ice Index is derived from.

All archived data reside in the following FTP location: <ftp://sidads.colorado.edu/DATASETS/NOAA/G02135/>

The Sea Ice Index archive contains the following:

- Monthly images of extent, concentration, anomalies, and trends from November 1978 through last month.  
Note: Daily images are not archived, however, the most recent daily image can be obtained from the Sea Ice Index Web page.
- Monthly sea ice extent and area data files.
- Monthly GIS compatible shapefiles of ice extent.
- Daily sea ice extent data files and daily climatology data files with data from November 1978 through yesterday.

## Demo Code

loadString()

SplitTokens()

Go through in detail Demo Code:

SealceJanuary

```
float[] samps = float( loadStrings( "january.txt" ) );
```

SealceMonthly

```
float[] vals = subset( float( splitTokens( line ) ), 1, 12 );
```

# Representing points

It's easy to pass a point to a function: just pass  $x$  and  $y$  separately.

```
vertex( 37, 192 );
```

Can we write a function that *returns* a point?

```
makeAPoint() { ... }
```

```
    sampleUnitSquare()
{
    float x = random( 1 );
    float y = random( 1 );

    return x y ;
}
```

```
float[] sampleUnitSquare()

{
    float x = random( 1 );
    float y = random( 1 );

    float[] result = { x, y };

    return result;
}
```

```
class Point
{
    float x;
    float y;

    Point( float xIn, float yIn )
    {
        x = xIn;
        y = yIn;
    }
}
```

```
class Point{  
    float x;  
    float y;  
  
    Point( float xIn, float yIn )  
    {  
        x = xIn;  
        y = yIn;  
    }  
}
```

```
Point sampleUnitSquare() {  
    float x = random( 1 );  
    float y = random( 1 );  
  
    return new Point( x, y );  
}
```

```
void setup()
{
    for( int idx = 0; idx < 100; ++idx ) {
        Point pt = sampleUnitSquare();
        ellipse( pt.x * 100, pt.y * 100, 10, 10 );
    }
}
```

Processing offers a built-in class **PVector** for representing points in 2D (and 3D!).

```
PVector sampleUnitSquare()
{
    float x = random( 1 );
    float y = random( 1 );

    return new PVector( x, y );
}

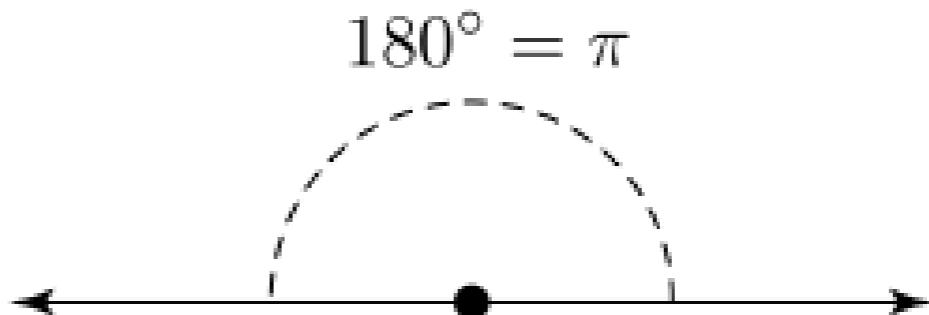

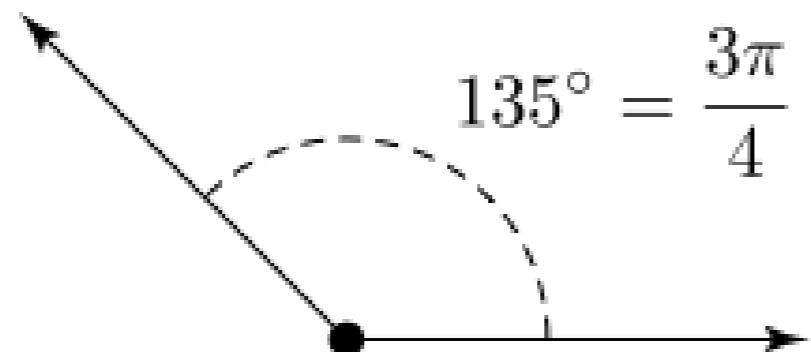

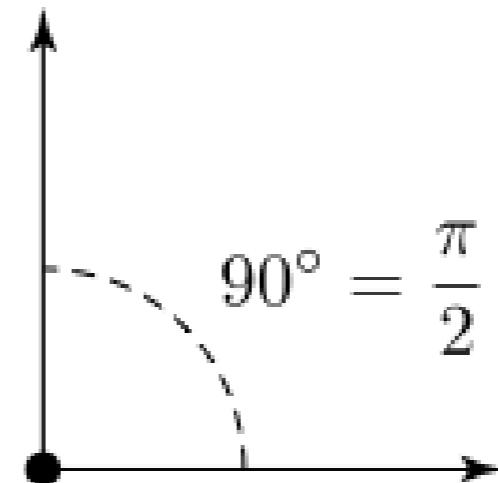

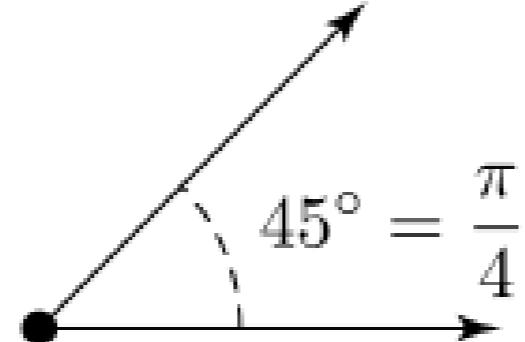

void setup()
{
    for( int idx = 0; idx < 100; ++idx ) {
        PVector pt = sampleUnitSquare();
        ellipse( pt.x * 100, pt.y * 100, 10, 10 );
    }
}
```

```
PVector[] pts = {  
    new PVector( 100, 100 ),  
    new PVector( 100, 300 ),  
    new PVector( 200, 300 ),  
    new PVector( 200, 200 ),  
    new PVector( 300, 200 ),  
    new PVector( 300, 100 )  
};
```

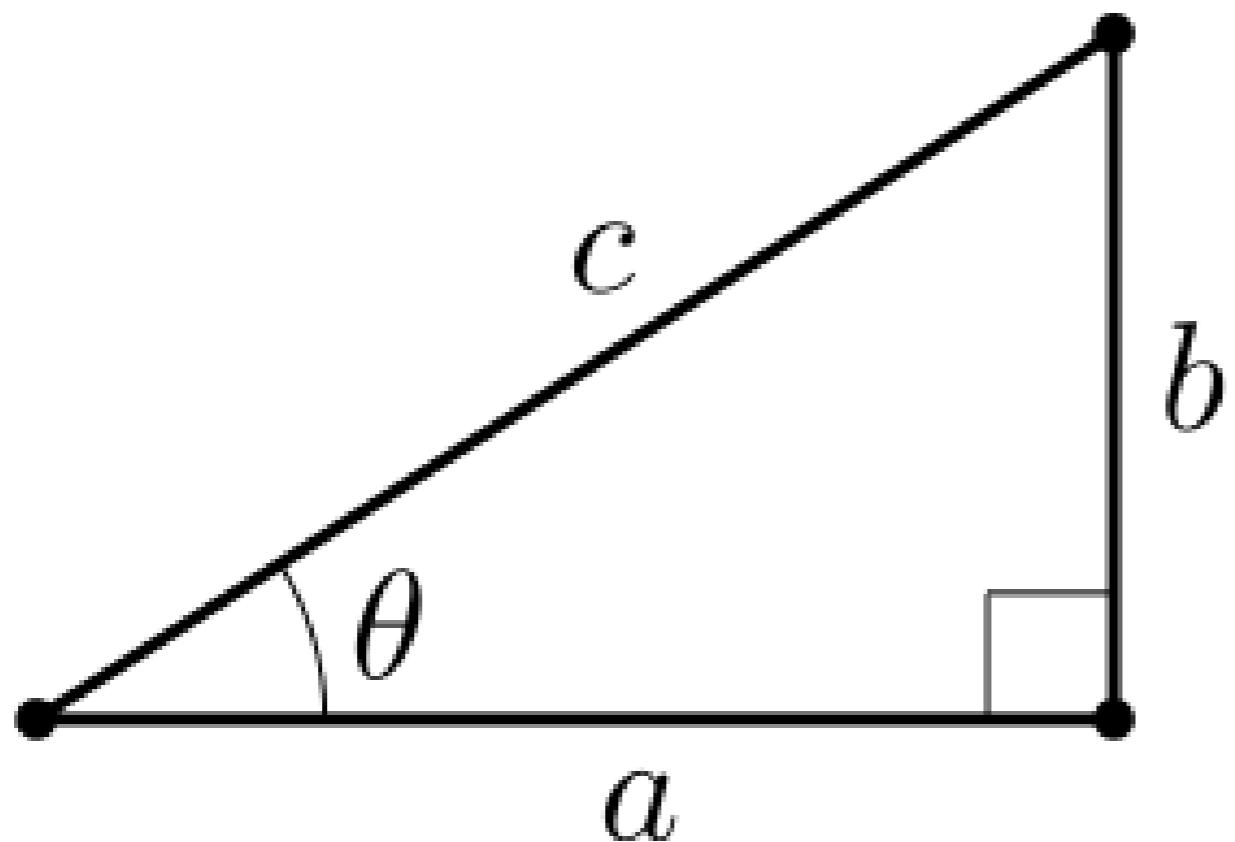

```
beginShape();  
for ( int idx = 0; idx < pts.length; ++idx ) {  
    vertex( pts[idx].x, pts[idx].y );  
}  
endShape( CLOSE );
```

# Angles

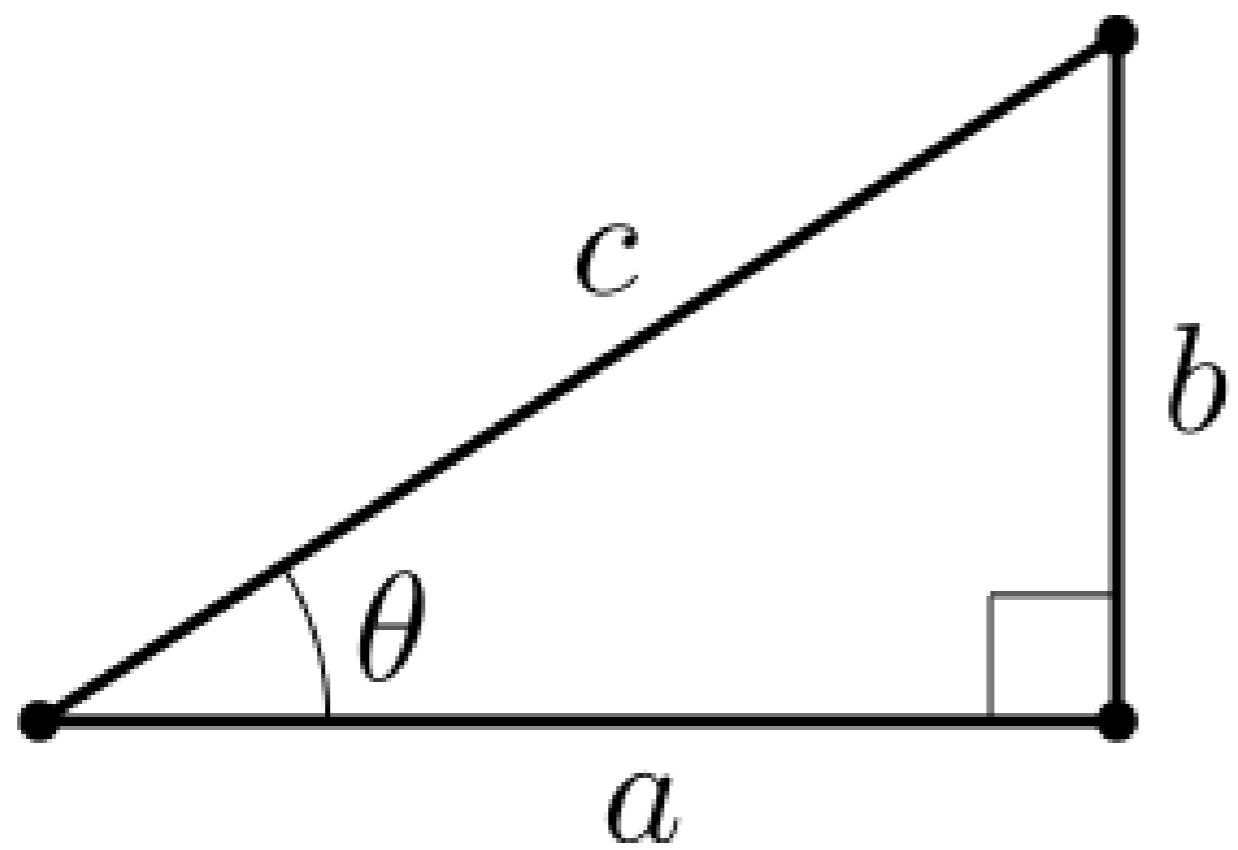

An *angle* is the measurement of the opening between two lines. We learn to measure angles in degrees, but programming languages usually expect them in *radians*.

# Trigonometry

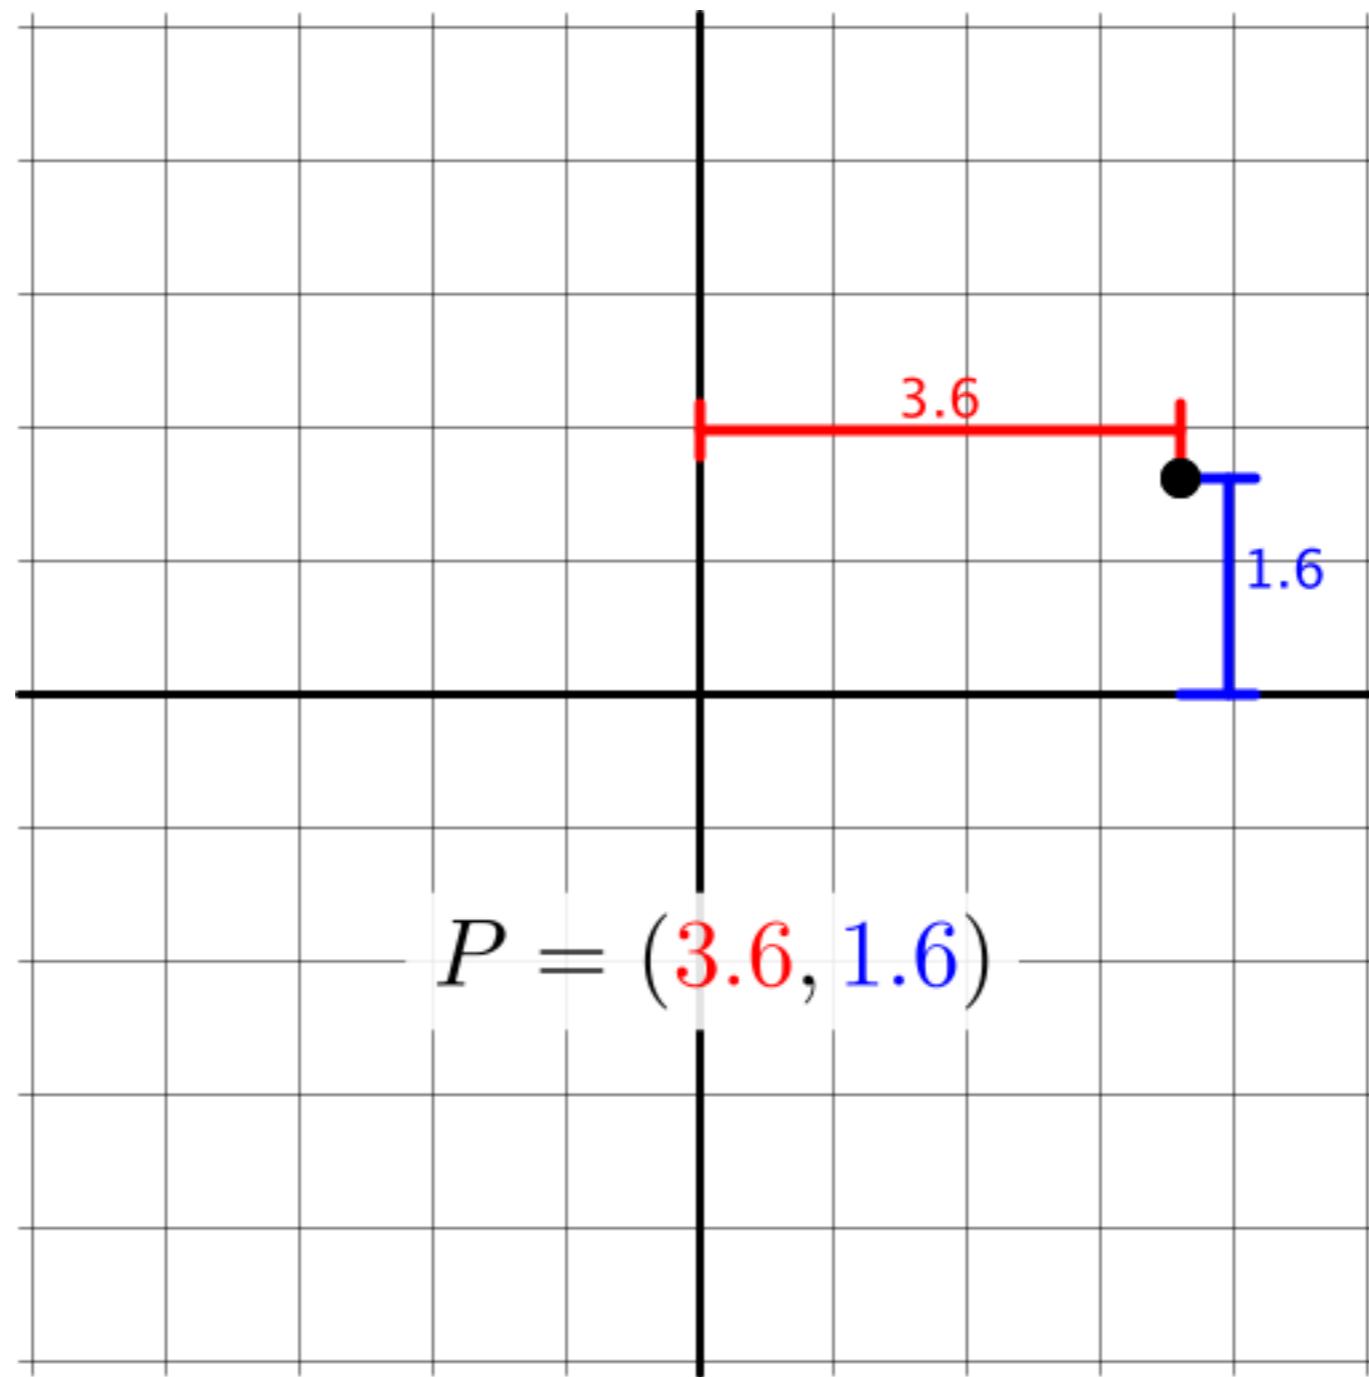

# Trigonometry

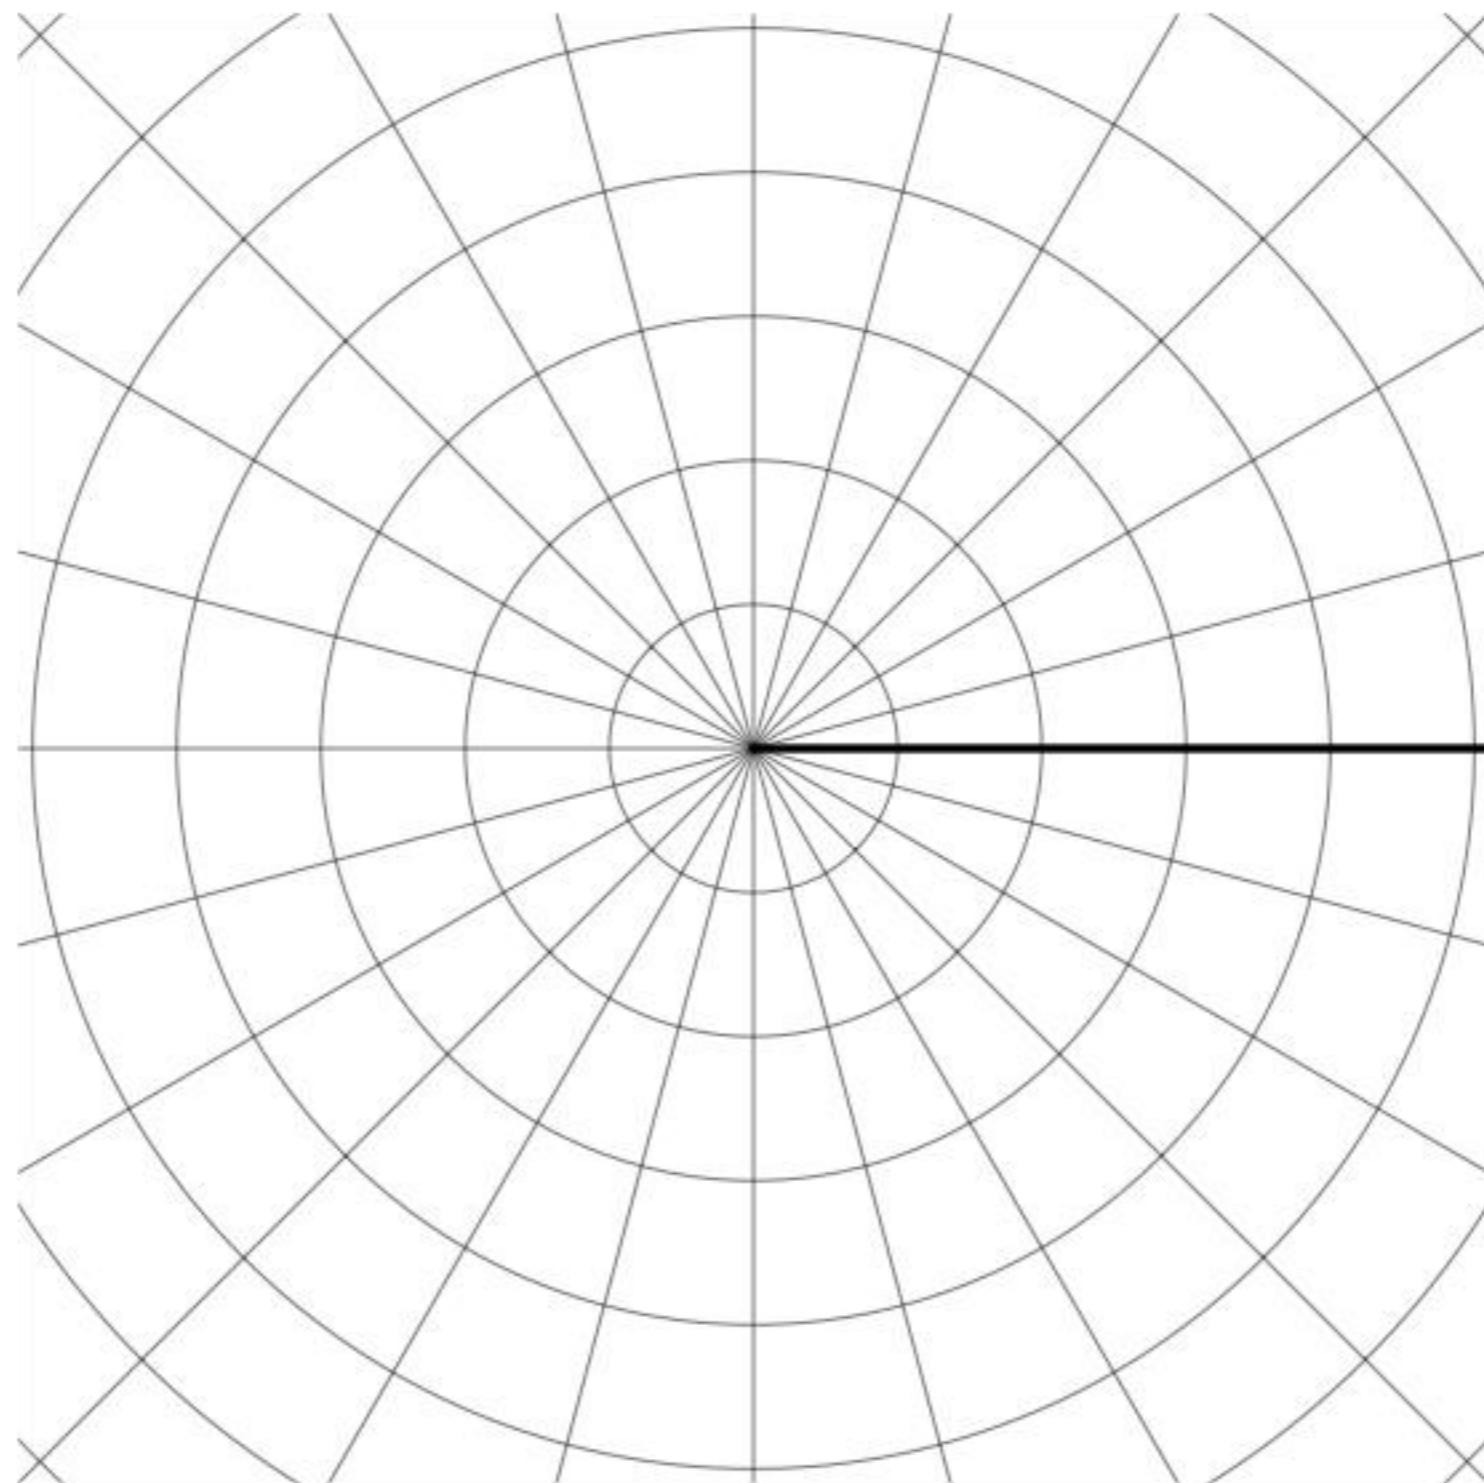

$$\sin \theta = \frac{b}{c}$$

$$\cos \theta = \frac{a}{c}$$

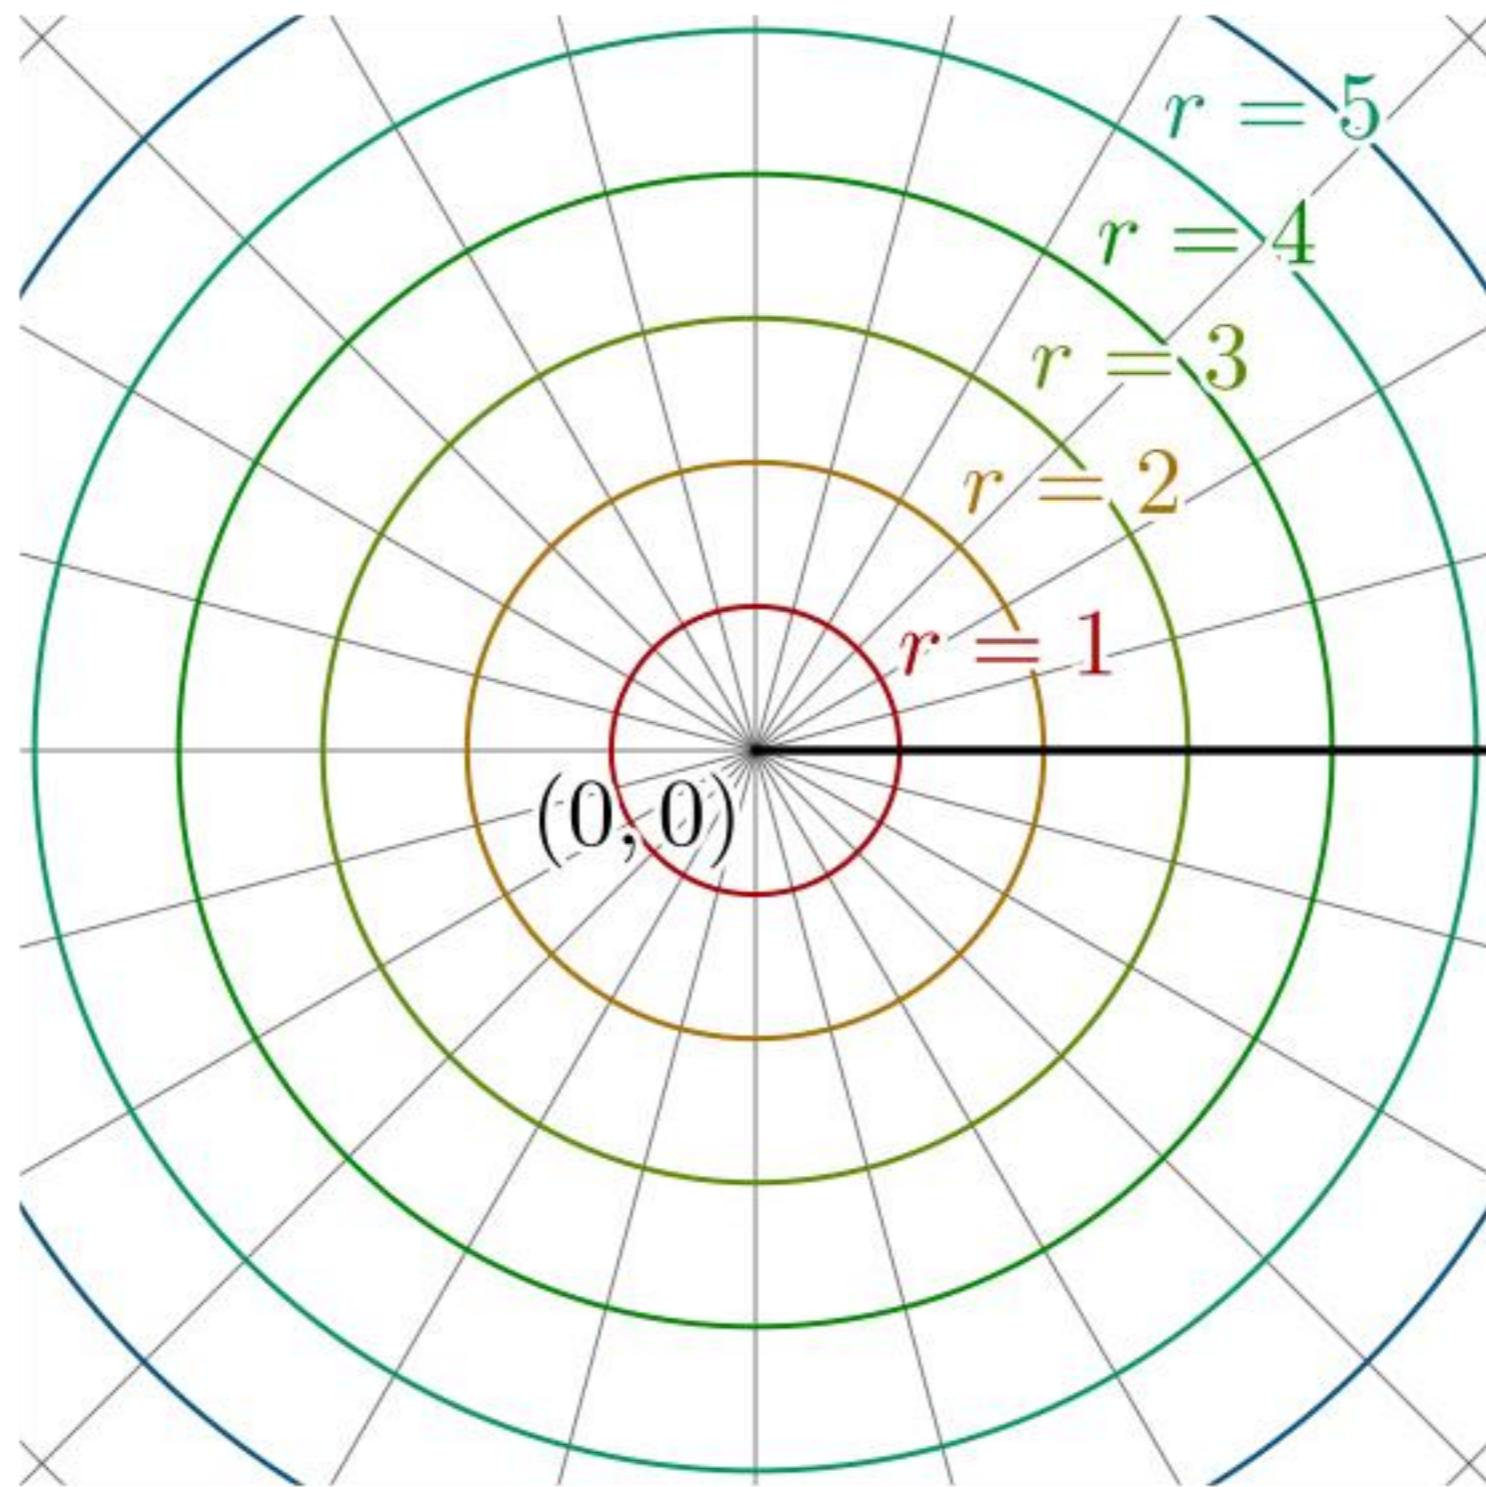

# Cartesian (i.e., regular) coordinates

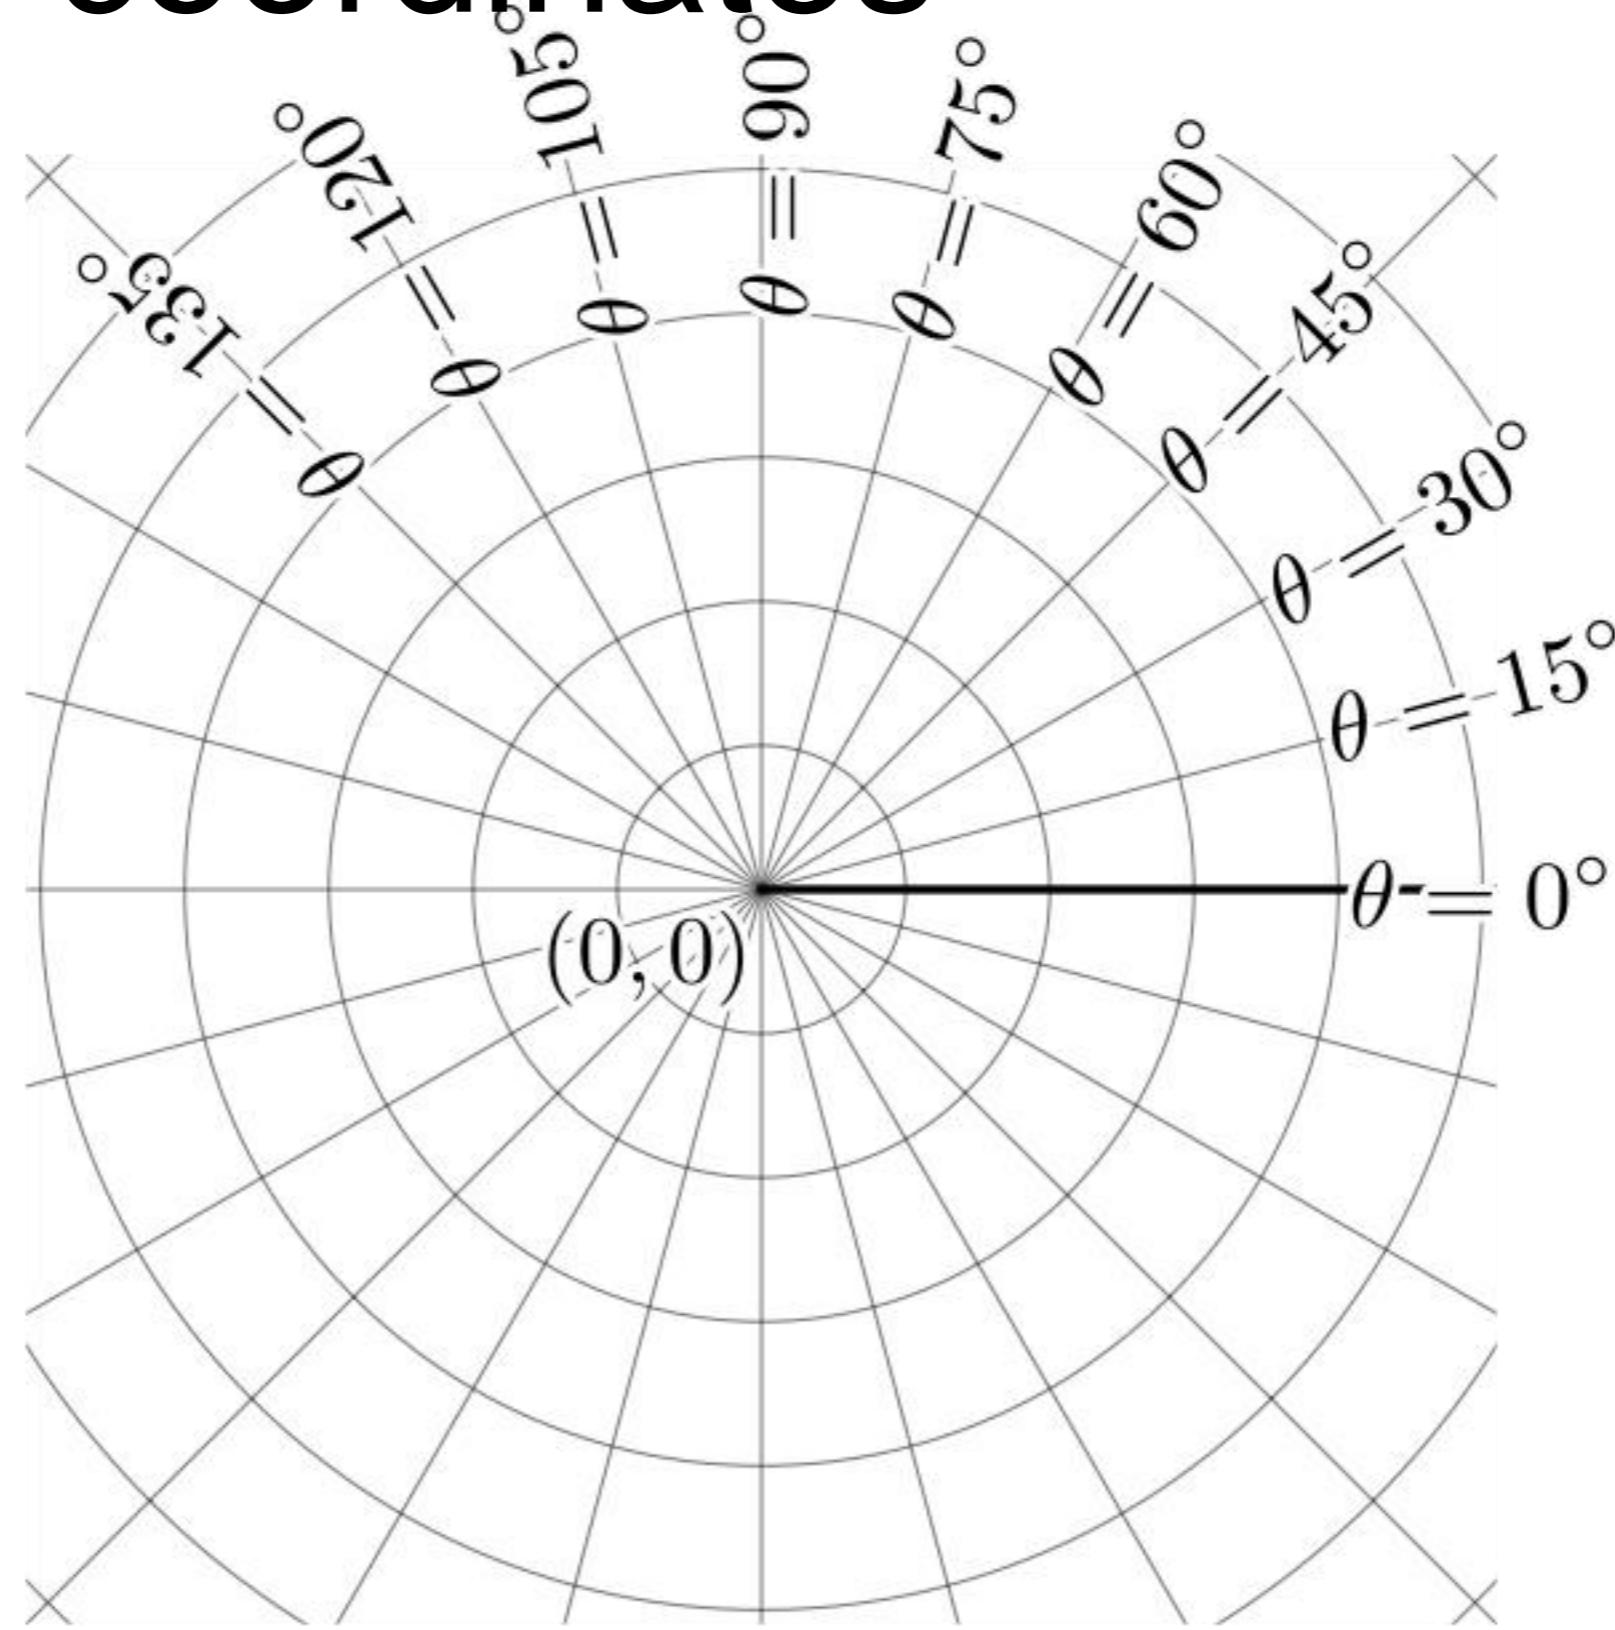

# Polar coordinates

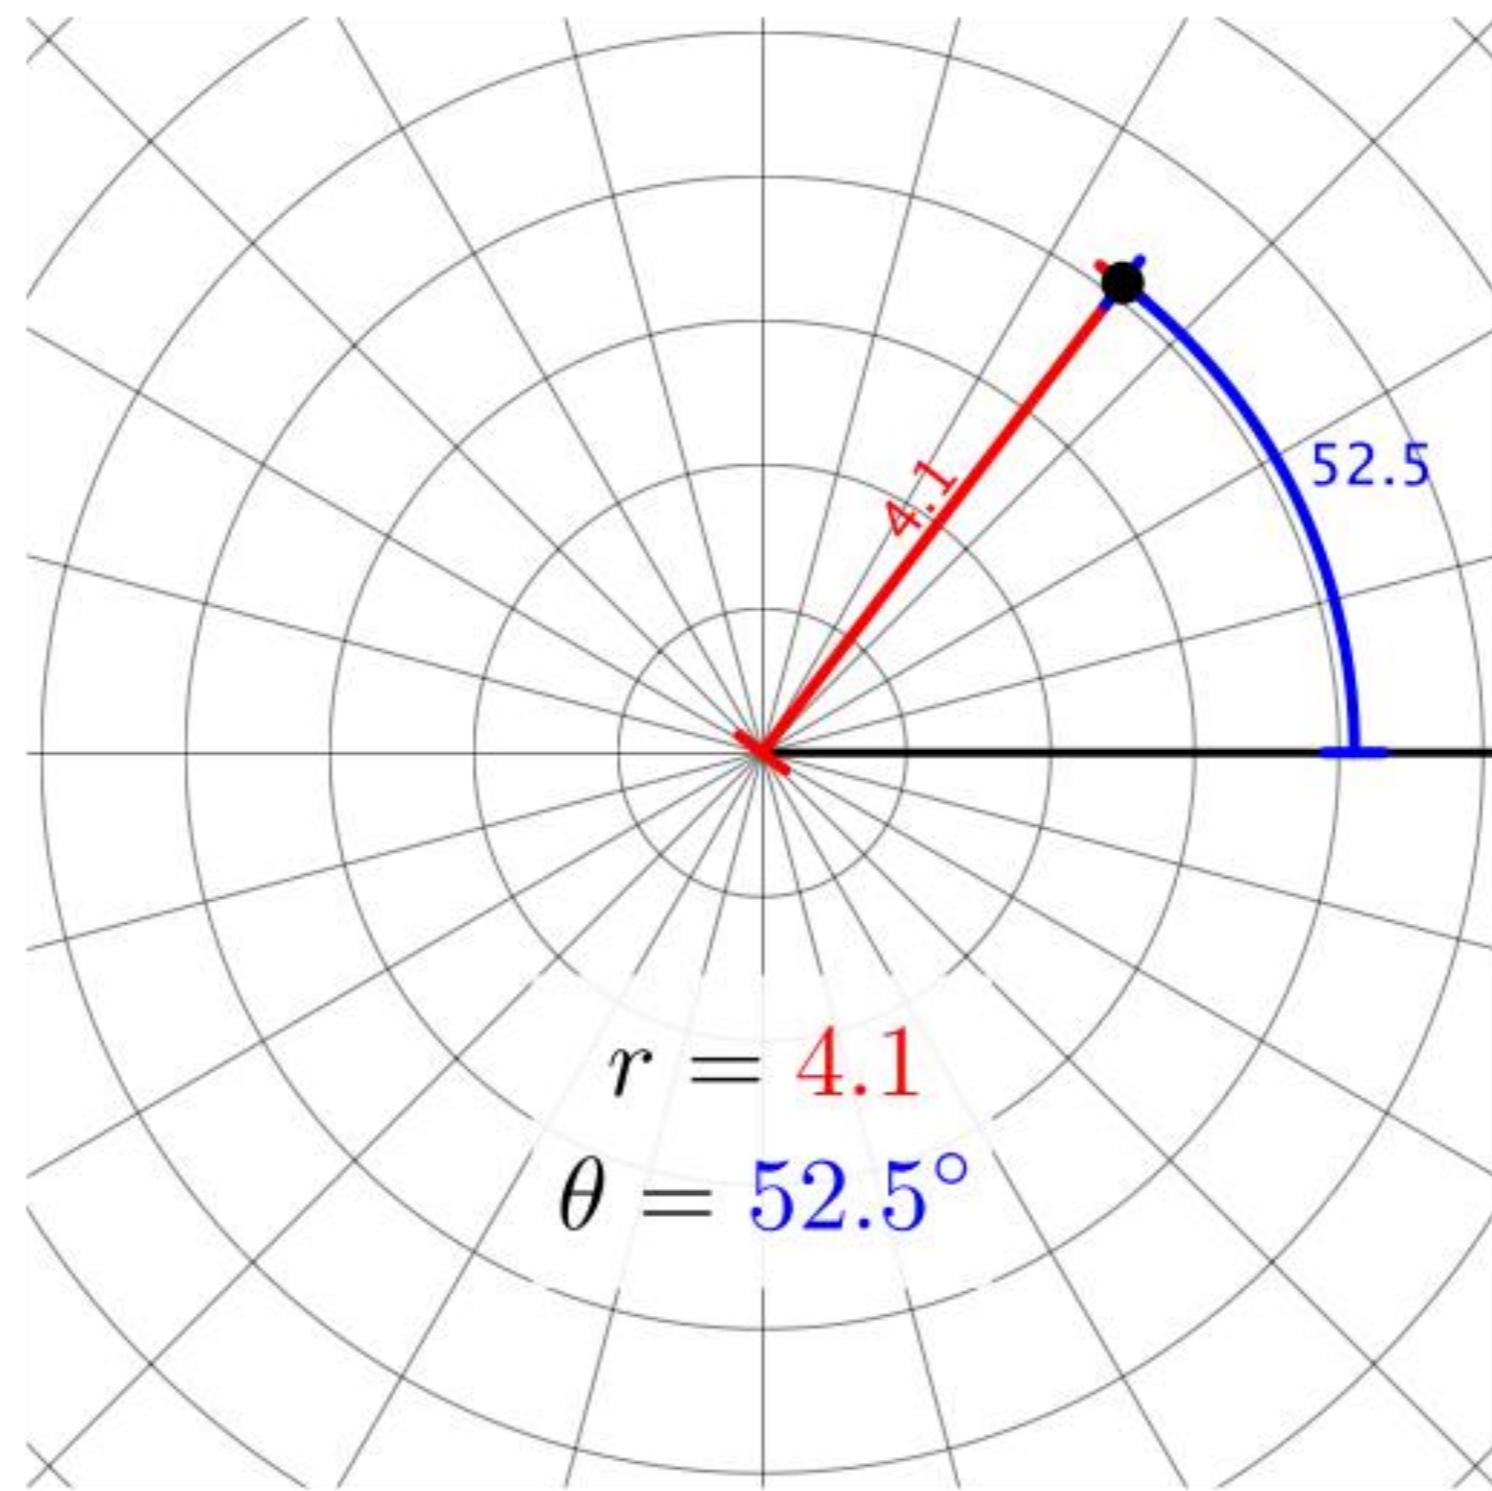

# Polar coordinates

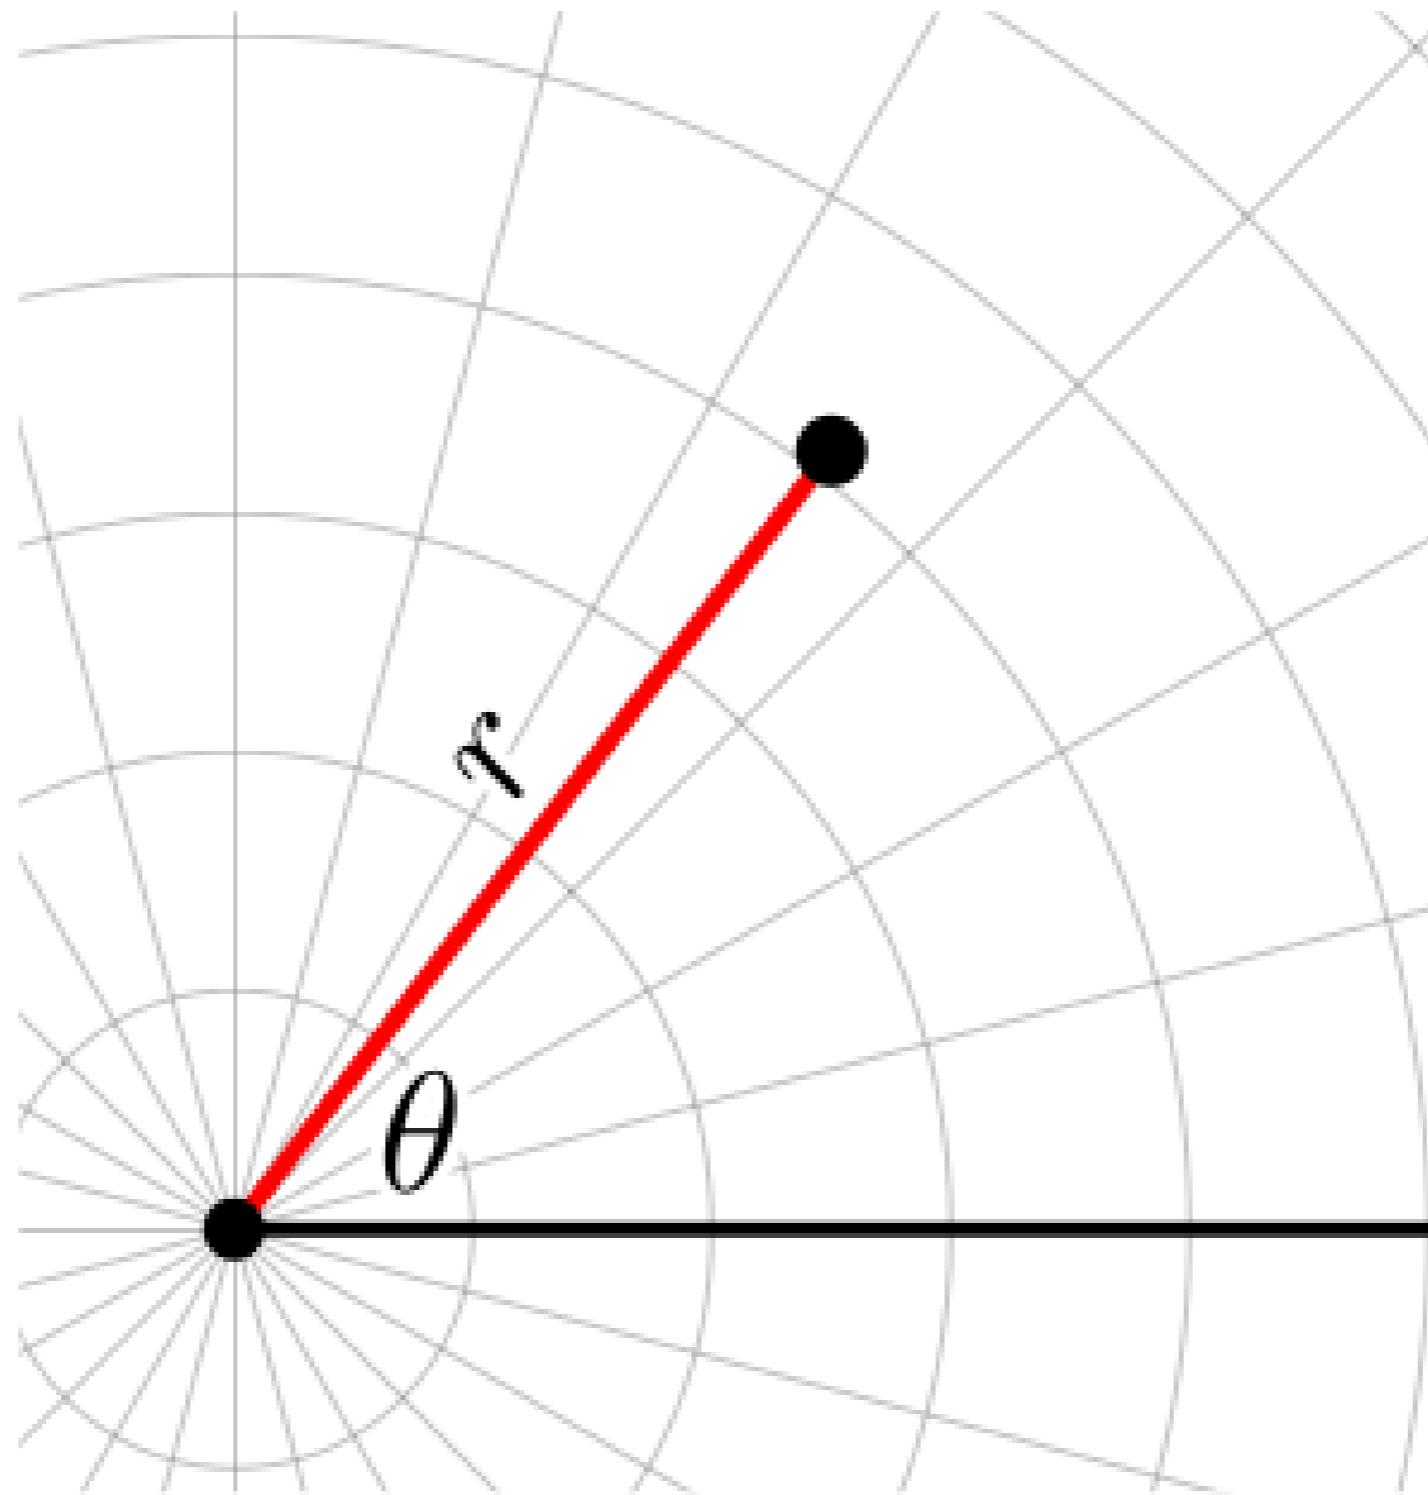

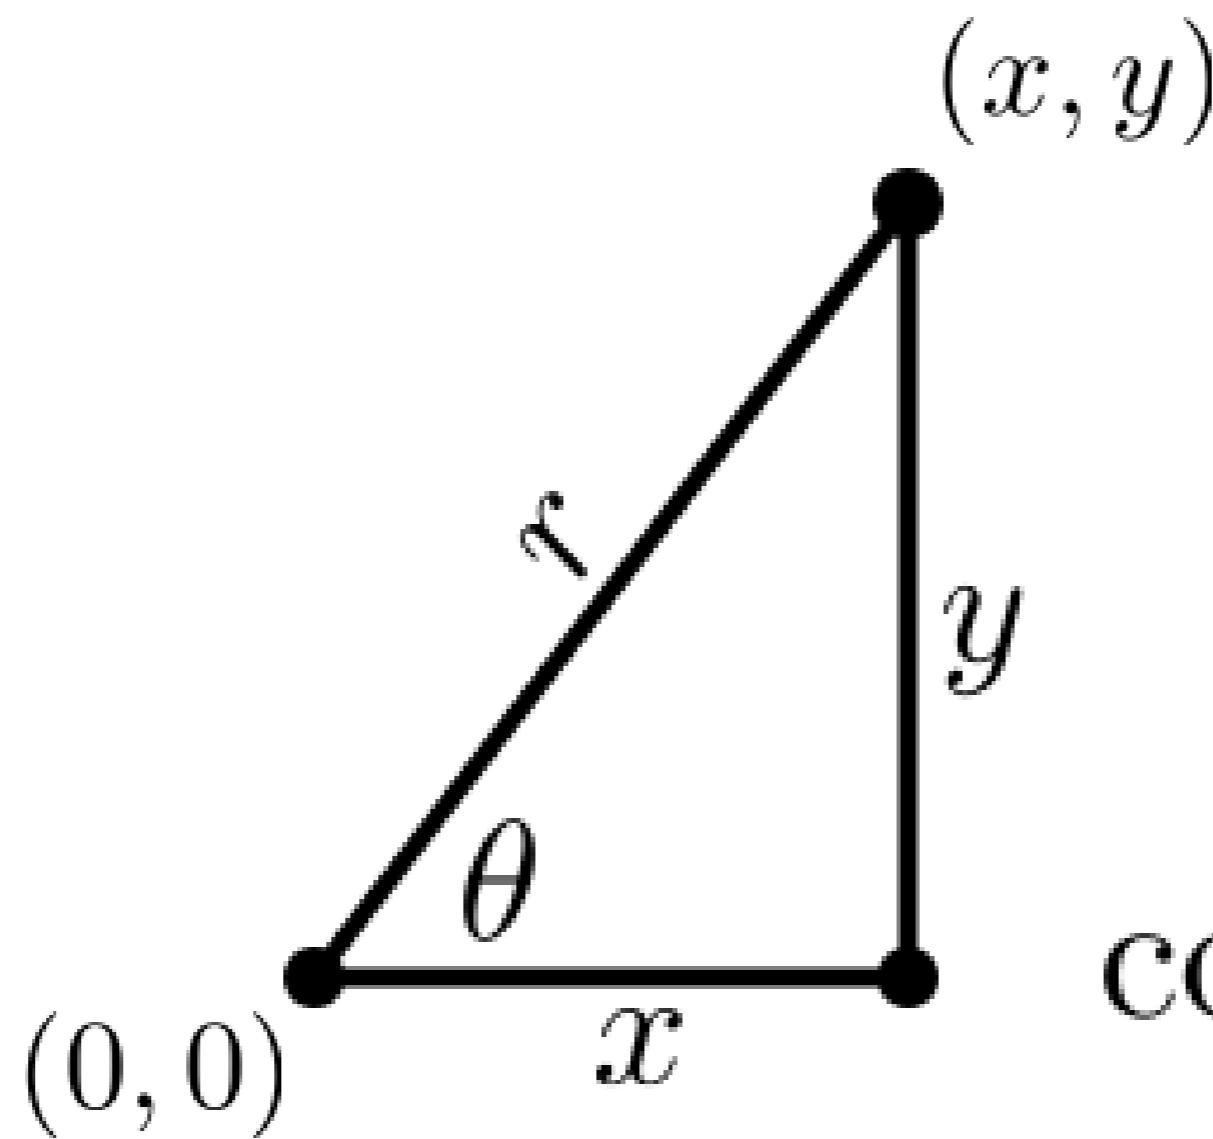

# Polar coordinates

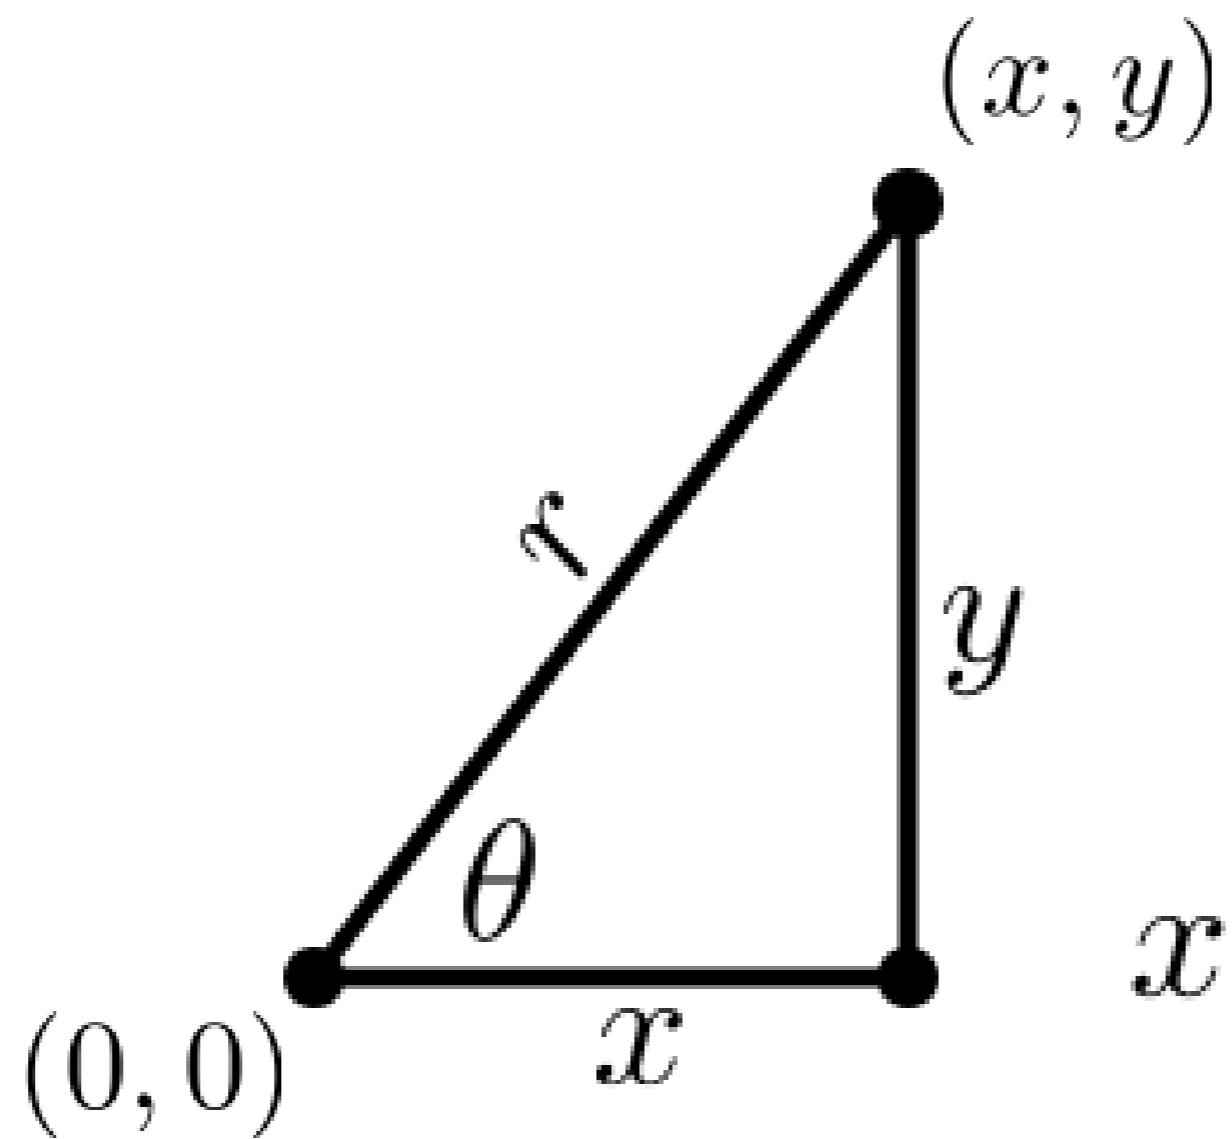

# Polar coordinates

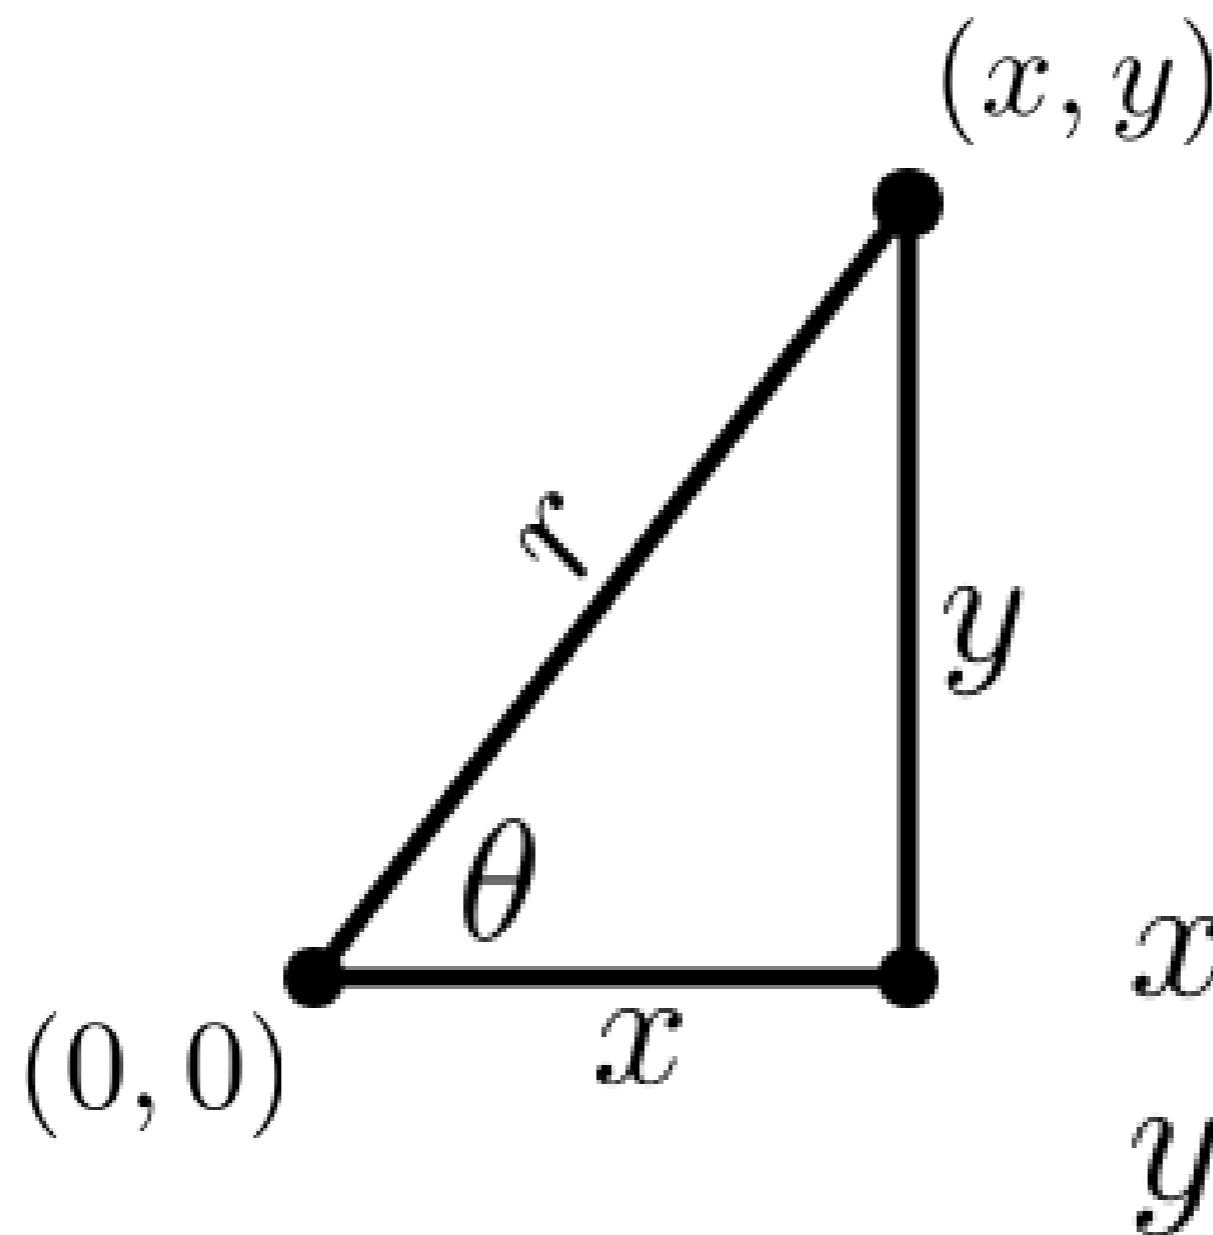

$$\cos \theta = \frac{x}{r}$$

$$x = r \cos \theta$$

$$x = r \cos \theta$$
$$y = r \sin \theta$$

# Polar to Cartesian

```
PVector polar( float r, float theta )  
{  
    float x = r * cos( theta );  
    float y = r * sin( theta );  
  
    return new PVector( x, y );  
}
```

# Polar to Cartesian

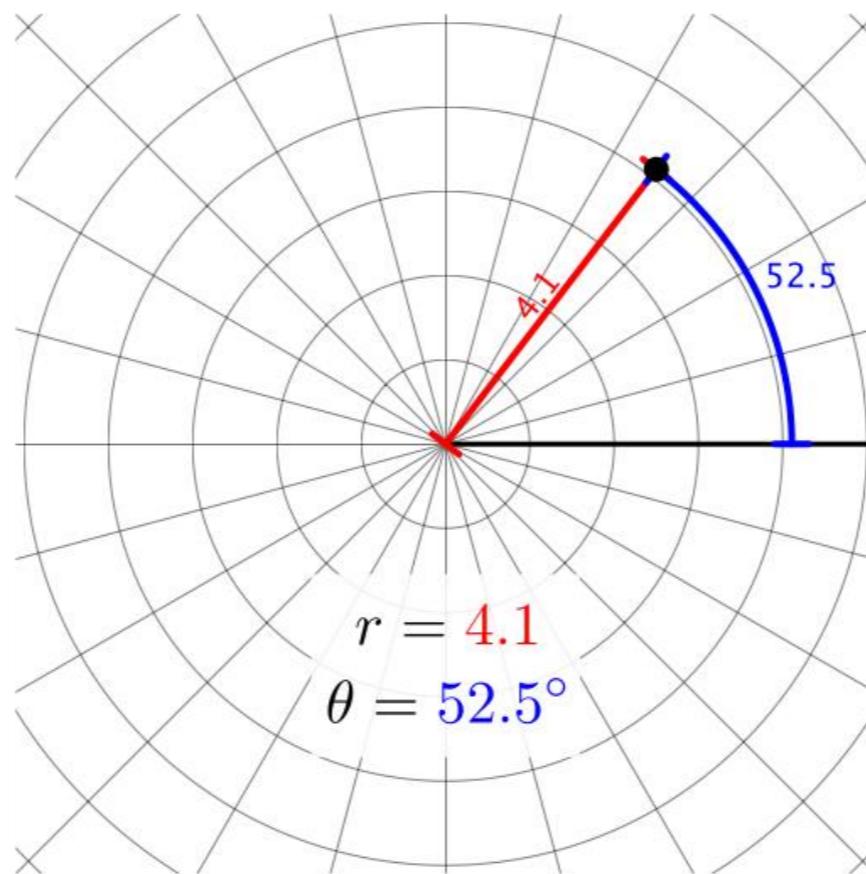

```
PVector polar( float r, float theta )  
{  
    float x = r * cos( radians( theta ) );  
    float y = r * sin( radians( theta ) );  
  
    return new PVector( x, y );  
}
```

Let's specify angles in degrees to avoid headaches.

# Polar to Cartesian

This is the part you need to know:

`PVector polar( float r, float theta ) {...}`

# Regular polygons
