Sea Ice Index Data and Image Archive

Here you can access the archived monthly and daily Sea Ice Index images and data as well as the input data that the Sea Ice Index is derived from.

All archived data reside in the following FTP location: <ftp://sidacs.colorado.edu/DATASETS/NOAA/G02135/>

The Sea Ice Index archive contains the following:

- Monthly images of extent, concentration, anomalies, and trends from November 1978 through last month.
Note: Daily images are not archived, however, the most recent daily image can be obtained from the Sea Ice Index Web page.
- Monthly sea ice extent and area data files.
- Monthly GIS compatible shapefiles of ice extent.
- Daily sea ice extent data files and daily climatology data files with data from November 1978 through yesterday.

Demo Code

loadString()

SplitTokens()

Go through in detail Demo Code:

SealceJanuary

```
let samps = float( loadStrings( "january.txt" ) );
```

SealceMonthly

```
let vals = float(splitTokens(line));
```

```
vals = vals.slice(1, 13);
```

cq

Representing points

It's easy to pass a point to a function: just pass x and y separately.

```
vertex( 37, 192 );
```

Can we write a function that *returns* a point?

```
function makeAPoint() {...}
```

```
function sampleUnitSquare() {  
    let x = random(1);  
    let y = random(1);  
    ...  
    return result;  
}
```

```
function sampleUnitSquare() {  
  let x = random(1);  
  let y = random(1);  
  
  let result = [x, y];  
  return result;  
}
```

```
function sampleUnitSquare() {  
  let p = {}  
  p.x = random(1);  
  p.y = random(1);  
  
  return p;  
}
```

```
function setup() {  
  for (let i = 0; i < 100; i++) {  
    let pt = sampleUnitSquare();  
    ellipse(pt.x * 100, pt.y * 100, 10, 10);  
  }  
}
```

Processing offers a `p5.Vector` for representing points in 2D (and 3D!).

```
function sampleUnitSquare() {  
  let x = random(1);  
  let y = random(1);  
  
  return createVector(x, y);  
}
```

```
function setup() {  
  for (let i = 0; i < 100; i++) {  
    let pt = sampleUnitSquare();  
    ellipse(pt.x * 100, pt.y * 100, 10, 10);  
  }  
}
```

```
let pts = [  
    createVector(100, 100),  
    createVector(100, 300),  
    createVector(200, 300),  
    createVector(200, 200),  
    createVector(300, 200),  
    createVector(300, 100)  
];  
  
beginShape();  
for (let i = 0; i < pts.length; i++) {  
    vertex(pts[i].x, pts[i].y);  
}  
endShape(CLOSE);
```

Angles

An *angle* is the measurement of the opening between two lines. We learn to measure angles in degrees, but programming languages usually expect them in *radians*.

Trigonometry

Trigonometry

$$\sin \theta = \frac{b}{c}$$

$$\cos \theta = \frac{a}{c}$$

Cartesian (i.e., regular) coordinates

Polar coordinates

Polar coordinates

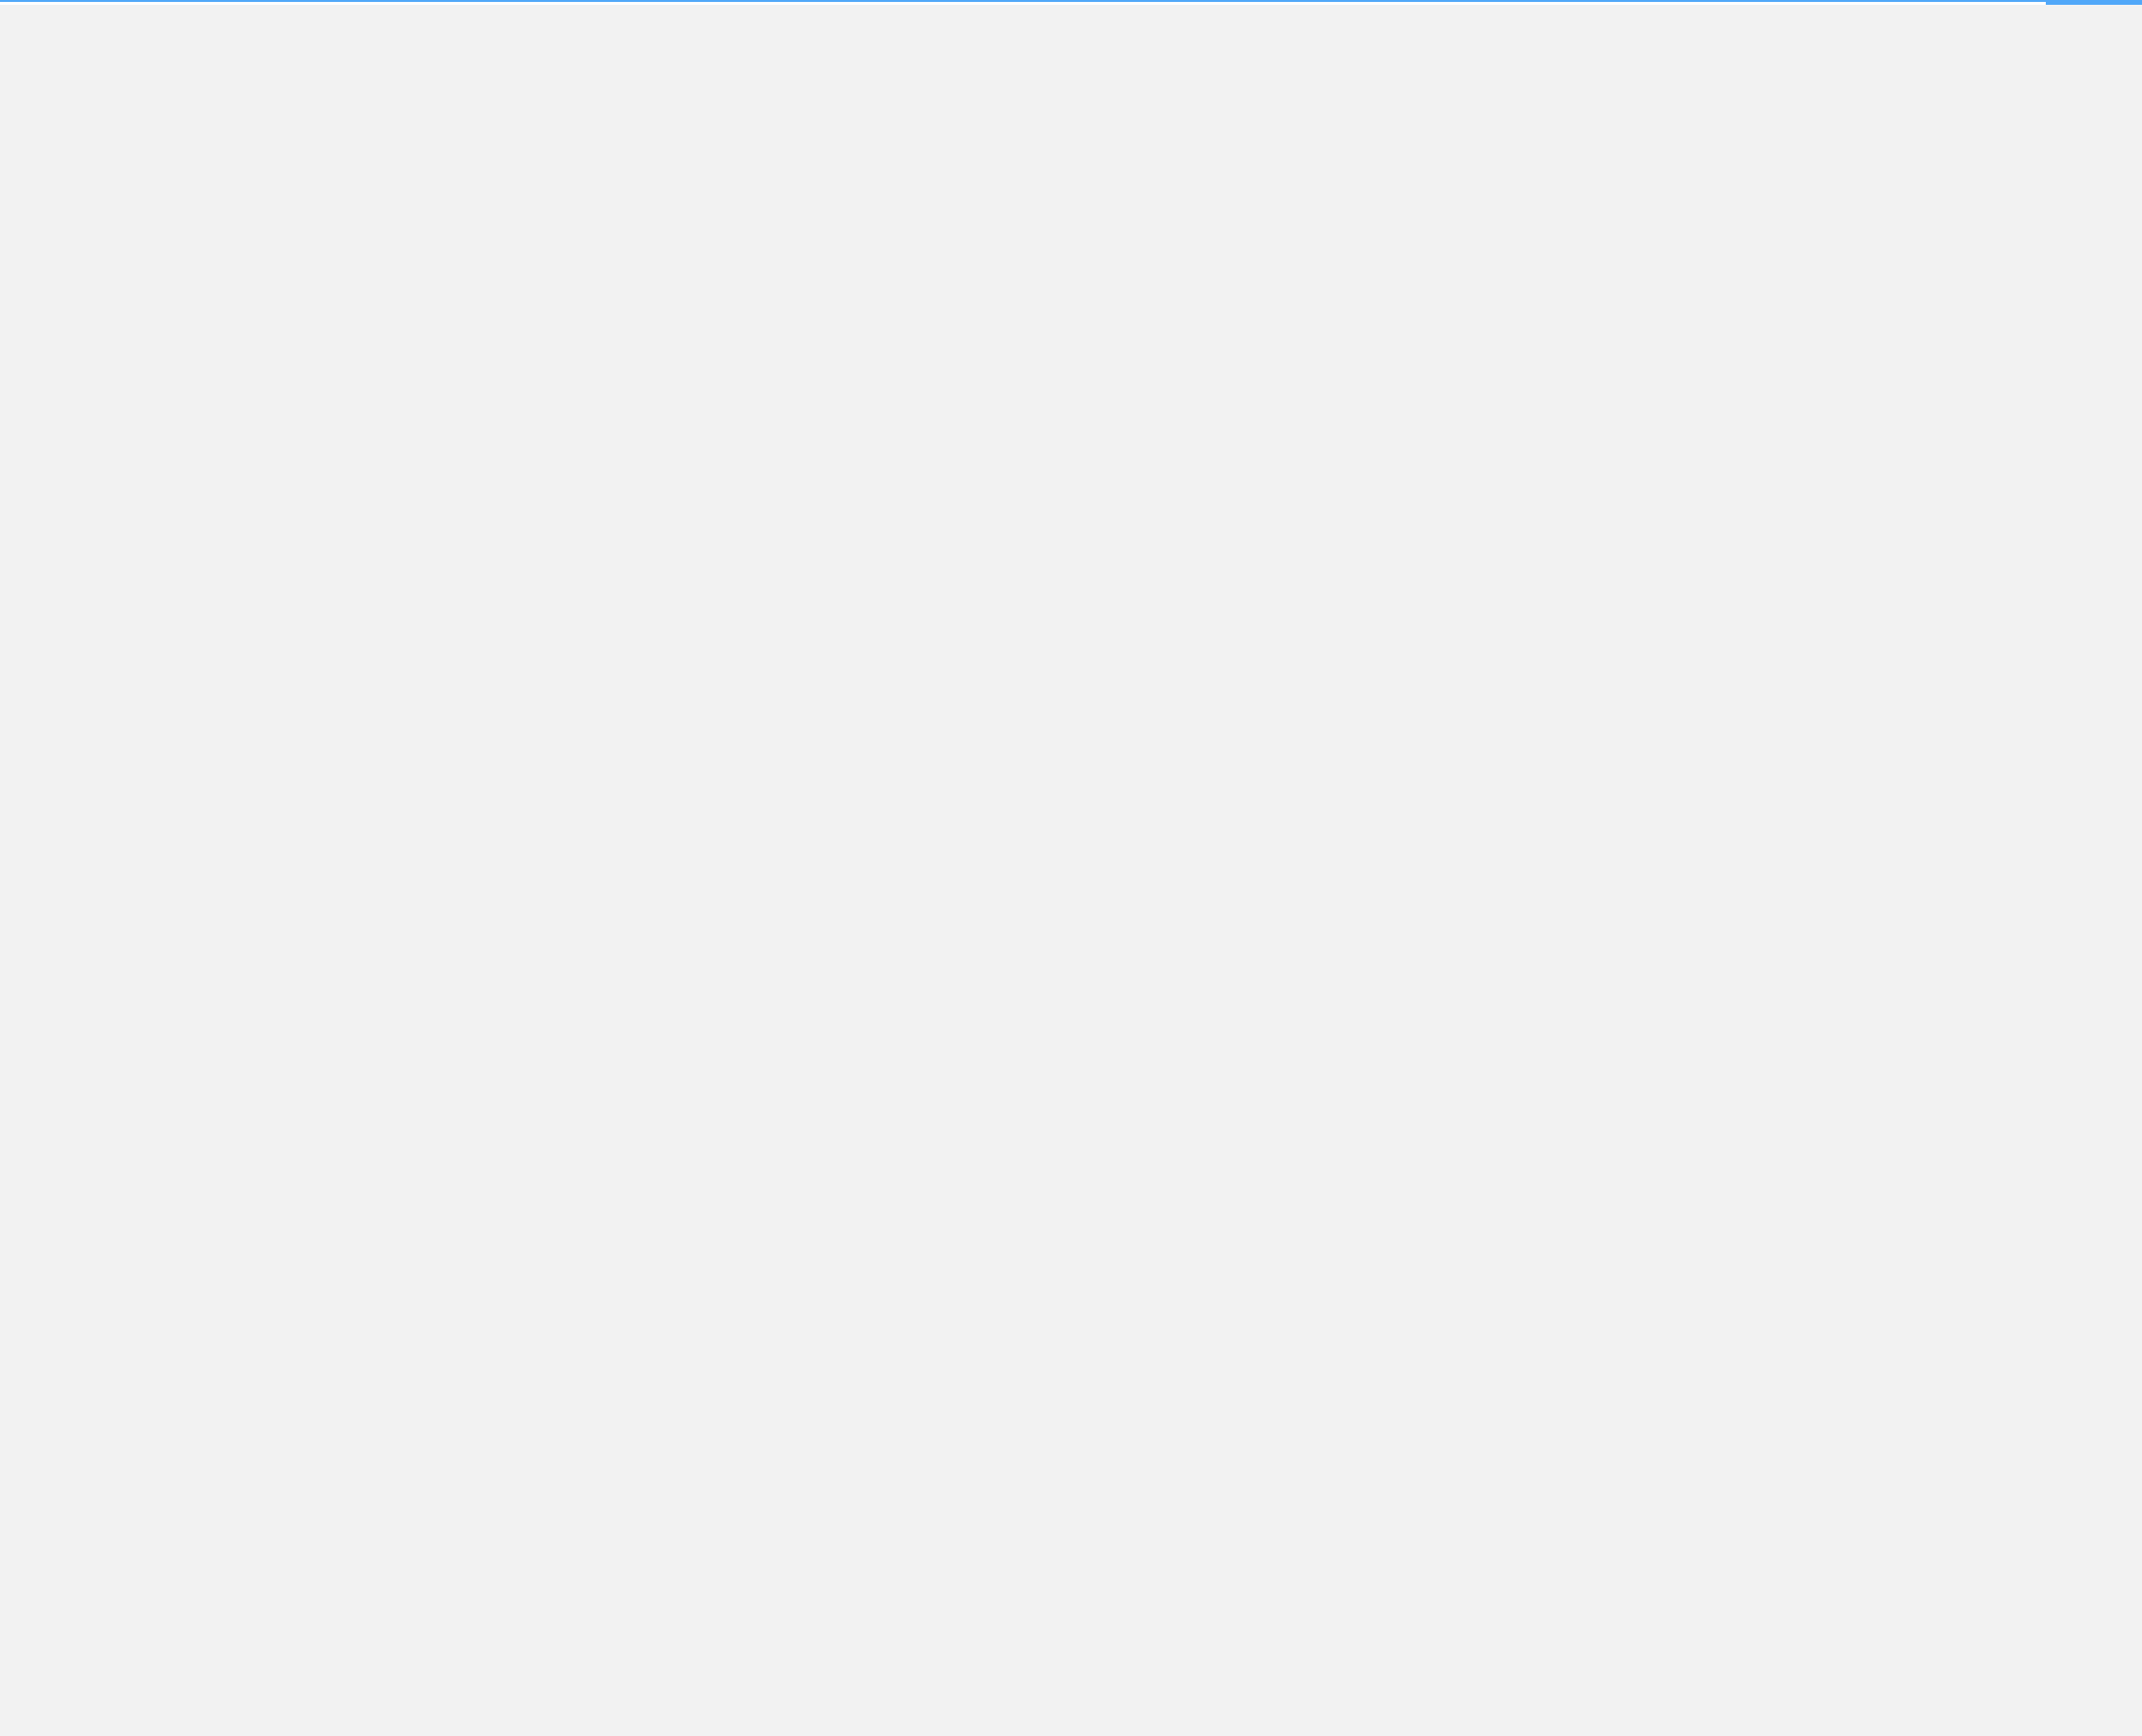

Polar coordinates

Polar coordinates

cq

$$x = r \cos \theta$$

$$x = r \cos \theta$$

$$y = r \sin \theta$$

Polar to Cartesian

```
function polar(r, theta) {  
  let x = r * cos(theta);  
  let y = r * sin(theta);  
  
  return createVector(x, y);  
}
```

Polar to Cartesian

```
function polar(r, theta) {  
  let x = r * cos(radians(theta));  
  let y = r * sin(radians(theta));  
  
  return createVector(x, y);  
}
```

Let's specify angles in degrees to avoid headaches.

Polar to Cartesian

This is the part you need to know:

```
function polar(r, theta) {...}
```

Regular polygons
