

CS 338 Mid-Term Exam Practice Problems on Lectures 09-11  
Not for handing in  
Model Solutions will be posted on Tuesday, June 23

## 1 Lecture 09

### Topics

1. SQL: Data Manipulation Basics
  - SELECT < attribute list >
  - (a) FROM < table list >
  - WHERE < condition >
  - (b) SELECT \*
  - (c) Prefixes
  - (d) Aliases
  - (e) FROM Two tables
  - (f) No WHERE clause

### Questions

1. Write a query to return all the department numbers and locations.

**Solution:**

```
/* Write a query to return all the department numbers and locations. */  
SELECT *  
FROM DEPT LOCATIONS
```

2. Write a query to return the name(s) of employees having dependents and who work on the 'Newbenefits' project.

**Solution:**

```
/* Write a query to return the name(s) of employees having dependents a  
SELECT FNAME, LNAME  
FROM EMPLOYEE, DEPENDENT, PROJECT, WORKS_ON  
WHERE EMPLOYEE.SSN = DEPENDENT.ESSN AND  
EMPLOYEE.SSN = WORKS_ON.ESSN AND  
PROJECT.PNUMBER = WORKS_ON.PNO AND  
PROJECT.PNAME = 'Newbenefits';
```

## 2 Lecture 10

### Topics

1. Extension to SELECT
  - (a) DISTINCT
  - (b) AS
  - (c) expression

- (d) aggregated
- 2. Extension to FROM
  - (a) Nested query
  - (b) Join

**Questions**

1. Write a query to return all the department numbers (AS DEPT\_NUM) and locations (AS DEPT\_LOC).

**Solution:**

```
/* Write a query to return all the department numbers (AS DEPT_NUM) and
SELECT DNUMBER AS DEPT_NUM, DLOCATION AS DEPT_LOC
FROM DEPT_LOCATIONS
```

2. Write a query to return all the distinct surnames of employees.

**Solution:**

```
/* Write a query to return all the distinct surnames of employees. */
SELECT DISTINCT LNAME
FROM EMPLOYEE;
```

3. Write a query to return the hours worked for each ESSN on project number 30, with the hours decreased by multiplying by 0.9 (we may have assumed that all employees are overstating their hours worked).

**Solution:**

```
/* Write a query to return the hours worked for each ESSN on project number 30.
SELECT ESSN, HOURS * 0.9
FROM WORKS_ON
WHERE PNO = 30;
```

4. Write a query to return the total hours worked on project number 30.

**Solution:**

```
/* Write a query to return the total hours worked (AS TOTAL_HOURS) for each project number 30.
SELECT SUM(HOURS) AS TOTAL_HOURS
FROM WORKS_ON
WHERE PNO = 30;
```

5. Write a query to return the employee SSN(s) having an above-average salary. Use a nested subquery in the FROM clause.

**Solution:**

```
/* Write a query to return the employee SSN(s) having an above-average salary. Use a nested subquery in the FROM clause. */
SELECT SSN
FROM EMPLOYEE,
  (SELECT AVG(SALARY) AS AVG_SALARY
FROM EMPLOYEE) AS AVERAGE_SALARY
WHERE SALARY > AVERAGE_SALARY.AVG_SALARY;
```

6. Write a query to return the project names for all projects that belong to the 'Software' department. Use a JOIN in the FROM clause.

**Solution:**

```
/* Write a query to return the project names for all projects that belong to the 'Software' department. Use a JOIN in the FROM clause. */  
SELECT PNAME  
FROM PROJECT INNER JOIN DEPARTMENT ON PROJECT.DNUM = DEPARTMENT.DNUMBER  
WHERE DEPARTMENT.DNAME = 'Software';
```

### 3 Lecture 11

#### Topics

1. Extension to WHERE
  - (a) Boolean and comparator
  - (b) Pattern matching
  - (c) Subquery
    - i. Correlated, or not?

#### Questions

1. Write a query to return the names of employees having salaries between \$50,000 and \$70,000, inclusive.

**Solution:**

```
/* Write a query to return the names of employees having salaries between $50,000 and $70,000, inclusive. */  
SELECT FNAME, LNAME  
FROM EMPLOYEE  
WHERE SALARY >= 50000 AND SALARY <= 70000;
```

2. Write a query to return the names of employees having the first character of their first names starting with H, K or N.

**Solution:**

```
/* Write a query to return the names of employees having the first character of their first names starting with H, K or N. */  
SELECT FNAME, LNAME  
FROM EMPLOYEE  
WHERE FNAME LIKE 'H%' OR FNAME LIKE 'K%' OR FNAME LIKE 'N%';
```

3. Write a query to return the employee SSN(s) having an above-average salary. Use a nested subquery in the WHERE clause.

**Solution:**

```
/* Write a query to return the employee SSN(s) having an above-average salary. Use a nested subquery in the WHERE clause. */  
SELECT SSN  
FROM EMPLOYEE  
WHERE SALARY > ALL (SELECT AVG(SALARY) FROM EMPLOYEE);
```

4. Is the nested subquery in the WHERE clause of the previous query correlated, or uncorrelated? Briefly justify your answer.

**Solution:**

- The subquery is not correlated.
- The subquery is self-contained - it can stand on its own without anything from the scope of the outer query.

## 4 Company Database Schema

### 1. DEPARTMENT

<u>DNAME</u>	<u>DNUMBER</u>	MGRSSN	MGRSTARTDATE
--------------	----------------	--------	--------------

### 2. DEPENDENT

<u>ESSN</u>	<u>DEPENDENT_NAME</u>	SEX	BDATE	RELATIONSHIP
-------------	-----------------------	-----	-------	--------------

### 3. DEPT\_LOCATIONS

<u>DNUMBER</u>	<u>DLOCATION</u>
----------------	------------------

### 4. EMPLOYEE

FNAME	MINIT	LNAME	<u>SSN</u>	BDATE	ADDRESS	SEX	SALARY	SUPERSSN	DNO
-------	-------	-------	------------	-------	---------	-----	--------	----------	-----

### 5. PROJECT

<u>PNAME</u>	<u>PNUMBER</u>	<u>PLOCATION</u>	<u>DNUM</u>
--------------	----------------	------------------	-------------

### 6. WORKS\_ON

<u>ESSN</u>	<u>PNO</u>	HOURS
-------------	------------	-------
