

# CS 430 - Lecture 21 - Planning and Estimation I - Function Points

Collin Roberts

November 28, 2023

# Outline

- 1 Planning and the Software Process
- 2 Estimating Duration and Cost
  - 1 Metrics for the Size of a S/W Product

# When To Estimate

after requirements workflow - only an informal understanding of what is needed

- 1 At this point, our ranges of estimates must be broad.
- 2 Figures 9.1 & 9.2 explain somewhat why this is true.

## When To Estimate

- 3 This is a summarized Figure 9.1 from the text. It displays a model for estimating the relative range of a cost estimate for each workflow.

Relative Range of Cost Estimate

## When To Estimate

- ④ This is a summarized Figure 9.2 from the text. It displays the range of cost estimates, in millions of dollars, for a software product that costs \$1 million to build.

Cost Estimate

# When To Estimate

- 5 We provide a preliminary estimate here, so that the client can decide whether to proceed to analysis or not.

# When To Estimate

after analysis workflow - a more detailed understanding of what is needed

- 1 For the rest of Ch 9, we assume that we are estimating at this point.

## Remarks:

- ① In practice, you may find yourself getting pressured by the client to reduce your preliminary estimates, to ensure that the project goes ahead. Common sense says that a client cannot dictate both the requirements and the costs to satisfy them. If the client thinks that the preliminary estimates are too high, then they can:
  - ① reduce the scope of the requirements, to reduce the estimated cost, or
  - ② increase the total budget.

Giving in to pressure to reduce estimates at this point **ALWAYS** leads to problems later on.

# Estimating Cost

All Costs of Development:

- ① **internal**, i.e. the cost of our developers, e.g.
  - ① salaries of project team members
  - ② costs of H/W and S/W
  - ③ overhead costs
- ② **external**, i.e. the price to the client, e.g.
  - ① usually internal costs plus some mark-up

# Estimating Duration

The client will need to know when to expect the S/W product to be delivered.

# Obstacles to Estimating Accurately

## ① human

- ① variations in quality
- ② turnover
- ③ varying levels of experience

# Function Points

- 1 **Function Points** provide a consistent basis for comparing the sizes of different S/W products.
- 2 Some larger projects were counted in terms of **function points (FP)** during my time at SLF.

# Function Points

Example like on pp273–275 in the text:

- Compute the **unadjusted function points (UFP)** for a software product having the following function point counts in conjunction with Figure 9.3 in the text (reproduced here).

# Function Points

**Figure 9.3 - Table of Function Point Values**

Component	Level of Complexity		
	Simple	Average	Complex
Input item	3	4	6
Output item	4	5	7
Inquiry	3	4	6
Master file	7	10	15
Interface	5	7	10

# Function Points

## Function Point Counts to Use

Component	Level of Complexity		
	Simple	Average	Complex
Input item	12	8	0
Output item	10	7	1
Inquiry	8	4	1
Master file	1	1	1
Interface	6	2	0

# Function Points

## Solution:

$$\begin{aligned}\text{UFP}(\text{Input item}) &= (12)(3) + (8)(4) + (0)(6) \\ &= 68\end{aligned}$$

$$\begin{aligned}\text{UFP}(\text{Output item}) &= (10)(4) + (7)(5) + (1)(7) \\ &= 82\end{aligned}$$

$$\begin{aligned}\text{UFP}(\text{Inquiry}) &= (8)(3) + (4)(4) + (1)(6) \\ &= 46\end{aligned}$$

$$\begin{aligned}\text{UFP}(\text{Master file}) &= (1)(7) + (1)(10) + (1)(15) \\ &= 32\end{aligned}$$

$$\begin{aligned}\text{UFP}(\text{Interface}) &= (6)(5) + (2)(7) + (0)(10) \\ &= 44, \text{ so that the total UFP is}\end{aligned}$$

$$\begin{aligned}\text{UFP} &= 68 + 82 + 46 + 32 + 44 \\ &= 272.\end{aligned}$$

# Function Points

- Compute the **technical complexity factor (TCF)** using the given counts for each factor in Figure 9.4 from the text (reproduced here).

# Function Points

**Figure 9.4 (augmented) - Technical factors for function point computation**

Factor	Name	Count to Use
1	Data communication	2
2	Distributed data processing	0
3	Performance criteria	3
4	Heavily utilized hardware	1
5	High transaction rates	3
6	Online data entry	5
7	End-user efficiency	5
8	Online updating	1
9	Complex computations	3
10	Reusability	3
11	Ease of installation	0
12	Ease of operation	5
13	Portability	3
14	Maintainability	5

# Function Points

**Solution:** Summing the counts in the above table gives us the **total degree of influence**:

$$\begin{aligned} DI &= 2 + 0 + 3 + 1 + 3 + 5 + 5 + 1 + 3 + 3 + 0 + 5 + 3 + 5 \\ &= 39, \end{aligned}$$

so that the corresponding **technical complexity factor (TCF)** is

$$\begin{aligned} TCF &= 0.65 + (0.01)DI \\ &= 0.65 + (0.01)(39) \\ &= 1.04. \end{aligned}$$

- Use the results of the previous two parts to compute the **function points (FP)** for the given software product.

## Solution:

$$\begin{aligned} FP &= (UFP)(TCF) \\ &= (272)(1.04) \\ &= 282.88, \end{aligned}$$

so that we measure this software product at  $283FP$ . (Only whole numbers make sense here; we **always round up** to be conservative.)

# Remarks About Function Points

- 1 Observe that nowhere in the computation of UFP or FP did we ask
  - 1 in what language is this software product written? or
  - 2 how many lines of code does this software product have?FP are designed to be independent of these factors. FP compare sizes of different software products, regardless of their implementations.
