## Software Design and Architectures

## Review

## Exam Breakdown

exam ..... project
Design ..... 4
Process and Model
Process and Model ..... 4 ..... 4
Modeling Software
Modeling Software ..... 4 ..... 4
Layered Systems
Layered Systems ..... 4 ..... 4
Shared Information Systems
Shared Information Systems ..... 8 ..... 8
Dataflow Systems
Dataflow Systems ..... 4 ..... 4
Clients, Servers, Brokers, and Components
Clients, Servers, Brokers, and Components ..... 4 ..... 4
Modularity
Modularity ..... 8 ..... 8
Module Development
Module Development ..... 8 ..... 8
Separation of Concerns
Separation of Concerns ..... 4 ..... 4
Database Technology for Embedded Control
Database Technology for Embedded Control ..... 4 ..... 4
Aspect-Oriented Programming
Aspect-Oriented Programming ..... 4 ..... 4
Feature Interaction
Feature Interaction ..... 4 ..... 4
Generative Programming and Feature Modeling
Generative Programming and Feature Modeling ..... 4 ..... 4
OO Design Principles
OO Design Principles ..... 8 ..... 8
Something Else
Something Else ..... 4 ..... 4
Project Material
Project Material ..... 20 ..... 20
Total
Total ..... 100 ..... 100

## Project Questions

Draw an architectural diagram of your (group's) implementation of the IPPhone system
showing all subsystems and their interfaces
all dependency relationships between subsystems
and the organization of the system into layers.
Label everything carefully.

## Project Questions

Draw a dataflow diagram which illustrates the communication between subsystems (of your IPPhone system) involved in the following scenarios
a billing period comes to an end and a bill is generated for a customer
a customer's account is closed and his phone service is terminated

For each communication path in the diagram, describe the events or communications which pass along it during the scenario.

## Project Questions

Choose two modules in your IPPhone system which are coupled in one direction only and are implemented in different programming languages.
(If your system is entirely in one language, choose a coupling from a module of yours to an off-the-shelf module.)

Describe the dependency and characterize the coupling.
(Use the coupling terminology introduced in class.)
For this particular case in your design, suppose that the dependent module is actually more stable than the depended-on module. What change to the architecture might be appropriate under this assumption, and why?
