Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:
Data Fault Status Code.
0b000000 Uncategorized error.
0b010001 Asynchronous SError interrupt.
All other values are reserved.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

Bits [24:6]
Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.
0b100010 Debug exception.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:
• For exceptions from AArch64, see Breakpoint exceptions on page D2-4707.
• For exceptions from AArch32, see Breakpoint exceptions on page G2-9054 and Vector Catch exceptions on page G2-9093.

ISS encoding for an exception from a Software Step exception

ISV, bit [24]
Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:
0b0 EX bit is RES0.
0b1 EX bit is valid.
See the EX bit bit description for more information.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:7]**

Reserved, RES0.

**EX, bit [6]**

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

- 0b0 An instruction other than a Load-Exclusive instruction was stepped.
- 0b1 A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

- 0b100010 Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see *Software Step exceptions on page D2-4742.*

**ISS encoding for an exception from a Watchpoint exception**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>23</td>
<td>WPT</td>
</tr>
<tr>
<td>22</td>
<td>WPTV</td>
</tr>
<tr>
<td>18-12</td>
<td>RES0</td>
</tr>
<tr>
<td>11-8</td>
<td>CM</td>
</tr>
<tr>
<td>7-3</td>
<td>DFSC</td>
</tr>
</tbody>
</table>

**Bit [24]**

Reserved, RES0.

**WPT, bits [23:18]**

*When FEAT_SME is implemented:*

Watchpoint number, 0 to 15 inclusive.

All other values are reserved.

*Otherwise:*

Reserved, RES0.

**WPTV, bit [17]**

*When FEAT_SME is implemented:*

Watchpoint number Valid.

- 0b0 The WPT field is invalid, and holds an UNKNOWN value.
- 0b1 The WPT field is valid, and holds the number of a watchpoint that triggered a Watchpoint exception.

When a Watchpoint exception is triggered by a watchpoint match:

- If the PE sets any of FnV, FnP, or WPF to 1, then the PE sets WPTV to 1.
If the PE sets all of FnV, FnP, and WPF to 0, then the PE sets WPTV to an IMPLEMENTATION DEFINED value, 0 or 1.

**Otherwise:**
Reserved, RES0.

**WPF, bit [16]**

*When FEAT_SME is implemented:*
Watchpoint might be false-positive.

- 0b0 The watchpoint matched the original access or set of contiguous accesses.
- 0b1 The watchpoint matched an access or set of contiguous accesses where the lowest accessed address was rounded down to the nearest multiple of 16 bytes and the highest accessed address was rounded up to the nearest multiple of 16 bytes minus 1, but the watchpoint might not have matched the original access or set of contiguous accesses.

**Otherwise:**
Reserved, RES0.

**FnP, bit [15]**

*When FEAT_SME is implemented:*
FAR not Precise.

This field only has meaning if the FAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

- 0b0 If the FnV field is 0, the FAR holds the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.
- 0b1 The FAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.

**Otherwise:**
Reserved, RES0.

**Bit [14]**
Reserved, RES0.

**VNCR, bit [13]**

*When FEAT_NV2 is implemented:*
Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

- 0b0 The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
- 0b1 The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bits [12:11]**
Reserved, RES0.

**FnV, bit [10]**

*When FEAT_SME is implemented:*
FAR not Valid.

- 0b0 The FAR is valid, and its value is as described by the FnP field.
The FAR is invalid, and holds an **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Bit [9]**

Reserved, **RES0**.

**CM, bit [8]**

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance instruction:

- **0b0** The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
- **0b1** The Watchpoint exception was generated by the execution of a cache maintenance instruction. The `DC ZVA`, `DC GVA`, and `DC GZVA` instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [7]**

Reserved, **RES0**.

**WnR, bit [6]**

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

- **0b0** Watchpoint exception caused by an instruction reading from a memory location.
- **0b1** Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is **UNPREDICTABLE** which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code.

- **0b100010** Debug exception.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see *Watchpoint exceptions* on page D2-4726.

**ISS encoding for an exception from execution of a Breakpoint instruction**

<table>
<thead>
<tr>
<th>Bit 24</th>
<th>Bit 16</th>
<th>Bit 15</th>
<th>Bit 0</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RES0</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [24:16]**

Reserved, **RES0**.
Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see *Breakpoint Instruction exceptions on page D2-4705.*

**ISS encoding for an exception from an ERET, ERETA, or ERETAB instruction**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>RES0</td>
</tr>
<tr>
<td>23</td>
<td>ERET</td>
</tr>
<tr>
<td>22</td>
<td>ERETA</td>
</tr>
</tbody>
</table>

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

**Bits [24:2]**

Reserved, RES0.

**ERET, bit [1]**

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>1</td>
<td>ERETA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ERETA, bit [0]**

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ERETAA instruction trapped to EL2.</td>
</tr>
<tr>
<td>1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

**ISS encoding for an exception from a TSTART instruction**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>RES0</td>
</tr>
<tr>
<td>23</td>
<td>Rd</td>
</tr>
<tr>
<td>22</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [24:10]**

Reserved, RES0.

**Rd, bits [9:5]**

The Rd value from the issued instruction, the general purpose register used for the destination.
D17.2 General system control registers

Bits [4:0]
Reserved, RES0.

**ISS encoding for an exception from Branch Target Identification instruction**

Bits [24:2]
Reserved, RES0.

**BTYPE, bits [1:0]**
This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see Chapter B1 *The AArch64 Application Level Programmers’ Model*.

**ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0**

Bits [24:0]
Reserved, RES0.

For more information about generating these exceptions, see:

- **HCR_EL2.API**, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- **SCR_EL3.API**, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

**ISS encoding for an exception from a Pointer Authentication instruction authentication failure**

Bits [24:2]
Reserved, RES0.

Bit [1]
This field indicates whether the exception is as a result of an Instruction key or a Data key.

- 0b0 Instruction Key.
- 0b1 Data Key.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.
- 0b0 A key.
- 0b1 B key.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:
- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:
- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing ESR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, ESR_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

D17.2.39  ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL3.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

**Attributes**

ESR_EL3 is a 64-bit register.

**Field descriptions**

ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:37]**

Reserved, RES0.

**ISS2, bits [36:32]**

*When FEAT_LS64 is implemented:*

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

**Otherwise:**

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

**EC == 0b0000000**

Unknown reason.

See ISS encoding for exceptions with an unknown reason.
EC == 0b000001
Trapped WF* instruction execution.
Conditional WF* instructions that fail their condition code check do not cause an exception.
See ISS encoding for an exception from a WF* instruction.

EC == 0b000011
When AArch32 is supported:
Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.
See ISS encoding for an exception from an MCR or MRC access.

EC == 0b000100
When AArch32 is supported:
Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.
See ISS encoding for an exception from an MCRR or MRRC access.

EC == 0b000101
When AArch32 is supported:
Trapped MCR or MRC access with (coproc==0b1110).
See ISS encoding for an exception from an MCR or MRC access.

EC == 0b000110
When AArch32 is supported:
Trapped LDC or STC access.
The only architected uses of these instruction are:
- An STC to write data to memory from DBGDTRRXint.
- An LDC to read data from memory to DBGDTRTXint.
See ISS encoding for an exception from an LDC or STC instruction.

EC == 0b000111
Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control.
Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.
See ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps.

EC == 0b001001
When FEAT_PAuth is implemented:
Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.
See ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0.

EC == 0b001010
When FEAT_LS64 is implemented:
An exception from an LD64B or ST64B* instruction.
See ISS encoding for an exception from an LD64B or ST64B* instruction.

EC == 0b001100
When AArch32 is supported:
Trapped MRRC access with (coproc==0b1110).
See ISS encoding for an exception from an MCRR or MRRC access.

EC == 0b001101
When FEAT_BTI is implemented:
Branch Target Exception.
See ISS encoding for an exception from Branch Target Identification instruction.

EC == 0b0001110
Illegal Execution state.
See ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

EC == 0b0100011
When AArch32 is supported:
SMC instruction execution in AArch32 state, when SMC is not disabled.
See ISS encoding for an exception from SMC instruction execution in AArch32 state.

EC == 0b0101010
When AArch64 is supported:
SMC instruction execution in AArch64 state.
See ISS encoding for an exception from SMC instruction execution in AArch64 state.

EC == 0b010110
When AArch64 is supported:
Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111.
This includes all instructions that cause exceptions that are part of the encoding space defined in System instruction class encoding overview on page C5-655, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.
See ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state.

EC == 0b0101110
When AArch64 is supported:
Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.
See ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ.

EC == 0b011000
When AArch64 is supported:
SVC instruction execution in AArch64 state.
See ISS encoding for an exception from SVC instruction execution in AArch64 state.

EC == 0b0110110
When AArch64 is supported:
HVC instruction execution in AArch64 state.
See ISS encoding for an exception from HVC instruction execution in AArch64 state.

EC == 0b0110111
When AArch64 is supported:
Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME == 0, EL0 when SCTLR_EL2.TME == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.
See ISS encoding for an exception from a TSTART instruction.

EC == 0b011100
When FEAT_FPAC is implemented:
Exception from a Pointer Authentication instruction authentication failure
See ISS encoding for an exception from a Pointer Authentication instruction authentication failure.

EC == 0b011101
When FEAT_SME is implemented:
Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, CPTR_EL3.ESM, or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC 0b000000.

See ISS encoding for an exception due to SME functionality.

**EC == 0b011110**

*When FEAT_RME is implemented:*

Exception from a Granule Protection Check

See ISS encoding for an exception from a Granule Protection Check.

**EC == 0b011111**

IMPLEMENTATION DEFINED exception to EL3.

See ISS encoding for an IMPLEMENTATION DEFINED exception to EL3.

**EC == 0b100000**

Instruction Abort from a lower Exception level.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

See ISS encoding for an exception from an Instruction Abort.

**EC == 0b100001**

Instruction Abort taken without a change in Exception level.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

See ISS encoding for an exception from an Instruction Abort.

**EC == 0b100010**

PC alignment fault exception.

See ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

**EC == 0b100100**

Data Abort exception from a lower Exception level.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

See ISS encoding for an exception from a Data Abort.

**EC == 0b100101**

Data Abort exception taken without a change in Exception level.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

See ISS encoding for an exception from a Data Abort.

**EC == 0b100110**

SP alignment fault exception.

See ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

**EC == 0b100111**

*When FEAT_MOPS is implemented:*

Memory Operation Exception.

See ISS encoding for an exception from the Memory Copy and Memory Set instructions.

**EC == 0b101100**

*When AArch64 is supported:*
Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

See ISS encoding for an exception from a trapped floating-point exception.

**EC == 0b101111**

SError interrupt.

See ISS encoding for an SError interrupt.

**EC == 0b111100**

*When AArch64 is supported:*

BRK instruction execution in AArch64 state.

This is reported in ESR_EL3 only if a BRK instruction is executed in EL3. This is the only debug exception that can be taken to EL3 when EL3 is using AArch64.

See ISS encoding for an exception from execution of a Breakpoint instruction.

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [25]**

Instruction Length for synchronous exceptions. Possible values of this bit are:

0b0 16-bit instruction trapped.

0b1 32-bit instruction trapped. This value is also used when the exception is one of the following:

- An SError interrupt.
- An Instruction Abort exception.
- A PC alignment fault exception.
- An SP alignment fault exception.
- A Data Abort exception for which the value of the ISV bit is 0.
- An Illegal Execution state exception.
- Any debug exception except for Breakpoint instruction exceptions.
- An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see *Mapping of the general-purpose registers between the Execution states* on page D1-4684.
If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

**ISS encoding for exceptions with an unknown reason**

![ISS encoding for exceptions with an unknown reason](image)

**Bits [24:0]**

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.

- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.

- In AArch32 state, attempted execution of a short vector floating-point instruction.

- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.

- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.

- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.

- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.

- Attempted execution of an MSR or MRS instruction using a _EL12 register name when HCR_EL2.E2H == 0.
• Attempted execution, in Debug state, of:
  — A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  — A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  — A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
• When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon.
• In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
• In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
• An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.
• In Non-transactional state, attempted execution of a TCOMMIT instruction.

**ISS encoding for an exception from a WF* instruction**

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>RES0</th>
<th>RN</th>
<th>RES0</th>
<th>RV</th>
<th>TI</th>
</tr>
</thead>
</table>

**CV, bit [24]**

Condition code valid.

- 0b0: The COND field is not valid.
- 0b1: The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  — CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the
    SPSR.IT field to determine the condition, if any, of the T32 instruction.
  — CV is set to 1 and COND is set to the condition code for the condition that applied to
    the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a
  trapped conditional instruction only if the instruction passes its condition code check, these
  definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND
  field is set to \(0b1110\), or to the value of any condition that applied to the instruction.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]
Reserved, RES0.

RN, bits [9:5]

**When FEAT_WFxT is implemented:**
Register Number. Indicates the register number supplied for a WFET or WFIT instruction.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

Bits [4:3]
Reserved, RES0.

RV, bit [2]

**When FEAT_WFxT is implemented:**
Register field Valid.
If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register
argument to the trapped WFET or WFIT instruction.

\(0b0\) Register field invalid.
\(0b1\) Register field valid.

If TI[1] == 0, then this field is RES0.
This field is set to 1 on a trap on WFET or WFIT.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

\(0b00\) WFI trapped.
\(0b01\) WFE trapped.
\(0b10\) **When FEAT_WFxT is implemented:**
WFIT trapped.
\(0b11\) **When FEAT_WFxT is implemented:**
WFET trapped.

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- `SCTLR_EL1.{nTWE, nTWI}`.
- `HCR_EL2.{TWE, TWI}`.
- `SCR_EL3.{TWE, TWI}`.

**ISS encoding for an exception from an MCR or MRC access**

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>Opc2</th>
<th>Opc1</th>
<th>CRn</th>
<th>Rt</th>
<th>CRm</th>
</tr>
</thead>
</table>

**CV, bit [24]**

- **0b0** The COND field is not valid.
- **0b1** The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.
For a trapped VMRS access, holds the value 0b000.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.
For a trapped VMRS access, holds the value 0b111.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.
For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.
If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:
- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  — The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  — The value 0b11111.

See *Mapping of the general-purpose registers between the Execution states* on page D1-4684. The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value 0b0000.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.
- 0b0 Write to System register space. MCR instruction.
- 0b1 Read from System register space. MRC or VMRS instruction.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- If **FEAT_TIDCP1** is implemented, **SCTLR_EL1.TIDCP**, for EL0 accesses to **IMPLEMENTATION DEFINED** functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1.

- **CNTKCTL_EL1.EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN**, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.

- **PMUSERENR_EL0.ER, CR, SW, EN**, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.

- **AMUSERENR_EL0.EN**, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.

- **HCR_EL1.TRVM, TVM**, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **HCR_EL2.TTTLB**, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **HCR_EL2.TSW, TPC, TPU**, for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **HCR_EL2.TACR**, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **HCR_EL2.TIDCP**, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- If **FEAT_TIDCP1** is implemented, **SCTLR_EL2.TIDCP**, for EL0 accesses to **IMPLEMENTATION DEFINED** functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **HCR_EL2.TID1, TID2, TID3**, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **CPTR_EL2.TCPAC**, for accesses to **CPACR_EL1 or CPACR** using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **HSTR_EL2.T<n>**, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **CNTHCTL_EL2.EL1PCEN**, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **MDCR_EL2.TPM, TPMCR**, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **CPTR_EL2.TAM**, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- **MDCR_EL3.TPM**, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

- **CPTR_EL3.TCPAC**, for accesses to **CPACR from EL1 and EL2**, and accesses to **HCPRTR from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111)** trapped to EL3.

- **CPTR_EL3.TAM**, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

- If **FEAT_FGT** is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.
The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- **CPACR_EL1.TTA** for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- **HCR_EL2.TID0**, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL2.TDA**, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- **HCR_EL2.TID0**, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- **HCR_EL2.TID3**, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

**ISS encoding for an exception from an LD64B or ST64B* instruction**

![ISS encoding diagram]

**ISS, bits [24:0]**

- 0b00000000000000000000000000000000 *When FEAT_LS64_V is implemented:* ST64BV instruction trapped.
- 0b00000000000000000000000000000001 *When FEAT_LS64_ACCDATA is implemented:* ST64BV0 instruction trapped.
- 0b00000000000000000000000000000010 *When FEAT_LS64 is implemented:* LD64B or ST64B instruction trapped.

All other values are reserved.
ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid.
- 0b0   The COND field is not valid.
- 0b1   The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:
- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.
The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.
For exceptions taken from AArch32:
- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [15]
Reserved, RES0.

Rt2, bits [14:10]
The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. If the Rt2 value is not \(0b1111\), then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is \(0b1111\):
- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value \(0b1111\).
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value \(0b1111\).

See Mapping of the general-purpose registers between the Execution states on page D1-4684.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]
The Rt value from the issued instruction, the first general-purpose register used for the transfer. If the Rt value is not \(0b1111\), then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is \(0b1111\):
- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value \(0b1111\).
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value \(0b1111\).

See Mapping of the general-purpose registers between the Execution states on page D1-4684.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]
The CRm value from the issued instruction.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]
Indicates the direction of the trapped instruction.
\(0b0\) Write to System register space. MCRR instruction.
\(0b1\) Read from System register space. MRRC instruction.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value \(0b000100\):
- CNTKCTL_EL1.\{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN\}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == \(0b1111\)) trapped to EL1 or EL2.
• **PMUSERENR_EL0.**{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.

• **AMUSERENR_EL0.**{EN}, for accesses to Activity Monitors registers AMEVCNTR0<:n> and AMEVCNTR1<:n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.

• **HCR_EL2.{TRVM, TVM},** for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

• **HISTR_EL2.T<:n>,** for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

• **CNSHCTL_EL2.{EL1PCEN, EL1PTEN},** for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

• **MDCR_EL2.{TPM, TPMCR},** for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

• **CPTR_EL2.TAM,** for accesses to Activity Monitors registers AMEVCNTR0<:n> and AMEVCNTR1<:n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

• **MDCR_EL3.TPM,** for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.

• **CPTR_EL3.TAM,** for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.

• If **FEAT_FGT** is implemented, **HDFGRTR_EL2.PMCCNTR_EL0** for MRRC access and **HDFGWTR_EL2.PMCCNTR_EL0** for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

• **MDSCR_EL1.TDCC,** for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.

• **MDCR_EL2.TDRA,** for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL3.TDA,** for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

• **CPACR_EL1.TTA** for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.

• **CPTR_EL2.TTA,** for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.

• **CPTR_EL3.TTA,** for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

--- **Note** ---

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

--- **ISS encoding for an exception from an LDC or STC instruction** ---

CV, bit [24]
Condition code valid.

0b0 The COND field is not valid.
0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:
- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]
For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:
- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]
The immediate value from the issued instruction.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]
Reserved, RES0.

Rn, bits [9:5]
The Rn value from the issued instruction, the general-purpose register used for the transfer.
If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value 0b11111.

See *Mapping of the general-purpose registers between the Execution states* on page D1-4684.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

- 0b0  Subtract offset.
- 0b1  Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

- 0b000  Immediate unindexed.
- 0b001  Immediate post-indexed.
- 0b010  Immediate offset.
- 0b011  Immediate pre-indexed.
- 0b100  For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
- 0b110  For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-11600.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits \{P, W\} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

- 0b0  Write to memory. STC instruction.
- 0b1  Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- **MDSCR_EL1.TDCC**, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.
- **MDCR_EL2.TDA**, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- **MDCR_EL3.TDA**, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

**ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps**

| 28 | 23 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | RES0 |

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

**CV, bit [24]**

Condition code valid.

- **0b0** The COND field is not valid.
- **0b1** The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  — With COND set to 0b1110, the value for unconditional.
  — With the COND value held in the instruction.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  — CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  — CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]
Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:
• CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
• CPACR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
• CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

The accesses covered by this trap include:
• Execution of SVE instructions when the PE is not in Streaming SVE mode.
• Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]
Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:
• CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
• CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
• CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.
**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

![ISS encoding diagram](image)

**Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see [PC alignment checking on page D1-4668](#).

[SP alignment checking on page D1-4668](#) describes the configuration settings for generating SP alignment fault exceptions.

**ISS encoding for an exception from the Memory Copy and Memory Set instructions**

![ISS encoding diagram](image)

**MemInst, bit [24]**

Indicates the memory instruction class causing the exception.

- **0b0**: CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
- **0b1**: SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**isSETG, bit [23]**

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

- **0b0**: Not a SETGM* or SETGE* instruction.
- **0b1**: SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Options, bits [22:19]**

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- **Bits[22:21]** are RES0.
- **Bits[20:19]** form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
FromEpilogue, bit [18]
Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

- 0b0: Not an epilogue instruction.
- 0b1: CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]
Algorithm option.

- 0b0: WrongOption is false.
- 0b1: WrongOption is true.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]
Algorithm type indicated by the PSTATE.C bit.

- 0b0: OptionB indicated by PSTATE.C is 0.
- 0b1: OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]
Reserved, RES0.

destreg, bits [14:10]
The destination register value from the issued instruction, containing the destination address.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]
The source register value from the issued instruction, containing either the source address or the source data.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]
The size register value from the issued instruction, containing the number of bytes to be transferred or set.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]
Reserved, RES0.
**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see SVC and HVC.

For A64 instructions, see SVC and HVC.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

**ISS encoding for an exception from SMC instruction execution in AArch32 state**

```
+---+---+---+---+
| CV| COND| 18| 16 |
+---+---+---+---+
| CCKNOWNPASS |
+---+---+---+---+
| RES0 |
```

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid.

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.
The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

--- Note ---

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

<table>
<thead>
<tr>

</table>

Bits [24:16]

Reserved, RES0.
imm16, bits [15:0]
The value of the immediate field from the issued SMC instruction.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:
• When an SMC instruction is trapped from EL1 modes.
• When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

**ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state**

<table>

</tr>
</tbody>
</table>
Direction, bit [0]

Indicates the direction of the trapped instruction.

- **0b0** Write access, including MSR instructions.
- **0b1** Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For exceptions caused by System instructions, see *System instructions on page C4-539* for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- If **FEAT_TIDCP1** is implemented, **SCTLR_EL1.TIDCP**, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.

- **SCTLR_EL1.UCI**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **SCTLR_EL1.UCT**, for accesses to **CTR_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **SCTLR_EL1.DZE**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **SCTLR_EL1.UMA**, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **CPACR_EL1.TTA**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- If **FEAT_FGT** is implemented, **MDCR_EL2.TDCC** for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

- **CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}** accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **PMUSERENR_EL0.{ER, CR, SW, EN}**, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **AMUSERENR_EL0.EN**, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- **HCR_EL2.{TRVM, TVM}**, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.TDZ**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.TTLB**, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.{TSW, TPC, TPU}**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.TACR**, for accesses to the Auxiliary Control Register, **ACTLR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
AArch64 System Register Descriptions

D17.2 General system control registers

- **HCR_EL2.TIDCP**, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.

- If **FEAT_TIDCP1** is implemented, **SCTLR_EL2.TIDCP**, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.{TID1, TID2, TID3}**, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.

- **CPTR_EL2.TCPAC**, for accesses to **CPACR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.

- **CPTR_EL2.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.

- **MDCR_EL2.TTRF**, for accesses to the trace filter control register, **TRFCR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.

- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.

- **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.

- **CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}**, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.

- **MDCR_EL2.TDA**, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.

- **MDCR_EL2.{TPM, TPMCR}**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.

- **CPTR_EL2.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.

- **HCR_EL2.{NV, NV1}**, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.

- **HCR_EL2.AT**, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.

- **HCR_EL2.{TERR, FIEN}**, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.

- **SCR_EL3.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.

- **SCR_EL3.ST**, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.

- **SCR_EL3.{TERR, FIEN}**, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.

- **CPTR_EL3.TCPAC**, for accesses to **CPTR_EL2** and **CPACR_EL1** using AArch64 state, MSR or MRS access trapped to EL3.

- **CPTR_EL3.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.

- **MDCR_EL3.TTRF**, for accesses to the trace filter control registers, **TRFCR_EL1** and **TRFCR_EL2**, using AArch64 state, MSR or MRS access trapped to EL3.
• MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

• MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

• MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.

• CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.

• If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  — HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  — HCR2.{TTLBIS, TICAB, TOCU, TID4}.

• If FEAT_FGT is implemented:
  — SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  — HFGTRR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  — HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  — HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  — HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

• If FEAT_RNG_TRAP is implemented:
  — SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.

• If FEAT_SME is implemented:
  — CPTR_EL3.ESM, for MSR or MRS accesses to SMPRI_EL1 at EL1, EL2, and EL3, trapped to EL3.
  — CPTR_EL3.ESM, for MSR or MRS accesses to SMPRIMAP_EL2 at EL2 and EL3, trapped to EL3.
  — SCTLR_EL1.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL1 or EL2.
  — SCTLR_EL2. EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL2.
  — SCR_EL3. EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, EL1, and EL2, trapped to EL3.

• If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.

**ISS encoding for an IMPLEMENTATION DEFINED exception to EL3**

<table>
<thead>

**SET, bits [12:11]**

*When FEAT_RAS is implemented:*

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

- 0b00: Recoverable state (UER).
- 0b10: Uncontainable (UC).
- 0b11: Restartable state (UEO).

All other values are reserved.

---

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts. The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- 0b0: FAR is valid.
- 0b1: FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts. The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.
S1PTW, bit [7]
For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:
0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.
For any abort other than a stage 2 fault this bit is RES0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]
Reserved, RES0.

IFSC, bits [5:0]
Instruction Fault Status Code.
0b000000 Address size fault, level 0 of translation or translation table base register.
0b000001 Address size fault, level 1.
0b000010 Address size fault, level 2.
0b000011 Address size fault, level 3.
0b000100 Translation fault, level 0.
0b000101 Translation fault, level 1.
0b000110 Translation fault, level 2.
0b000111 Translation fault, level 3.
0b001000 Access flag fault, level 0.
0b001001 Access flag fault, level 1.
0b001010 Access flag fault, level 2.
0b001011 Access flag fault, level 3.
0b001100 When FEAT_LPA2 is implemented:
Access flag fault, level 0.
0b001101 When FEAT_LPA2 is implemented:
Permission fault, level 0.
0b001110 Permission fault, level 1.
0b001111 Permission fault, level 2.
0b010000 Synchronous External abort, not on translation table walk or hardware update of translation table.
0b010001 When FEAT_LPA2 is implemented:
Synchronous External abort on translation table walk or hardware update of translation table, level -1.
0b010010 Synchronous External abort on translation table walk or hardware update of translation table, level 0.
0b010011 Synchronous External abort on translation table walk or hardware update of translation table, level 1.
0b010100 Synchronous External abort on translation table walk or hardware update of translation table, level 2.
0b010101 Synchronous External abort on translation table walk or hardware update of translation table, level 3.
0b010110 When FEAT_RAS is not implemented:
Synchronous parity or ECC error on memory access, not on translation table walk.
0b010111 When FEAT_LPA2 is implemented and FEAT_RAS is not implemented:
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.

0b011100  *When FEAT_RAS is not implemented:*
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.

0b011101  *When FEAT_RAS is not implemented:*
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.

0b011110  *When FEAT_RAS is not implemented:*
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.

0b011111  *When FEAT_RAS is not implemented:*
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.

0b100011  *When FEAT_RME is implemented and FEAT_LPA2 is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level -1.

0b100100  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 0.

0b100101  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 1.

0b100110  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 2.

0b100111  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 3.

0b101000  *When FEAT_RME is implemented:*
Granule Protection Fault, not on translation table walk or hardware update of translation table.

0b101001  *When FEAT_LPA2 is implemented:*
Address size fault, level -1.

0b101011  *When FEAT_LPA2 is implemented:*
Translation fault, level -1.

0b110000  TLB conflict abort.

0b110001  *When FEAT_HAFDBS is implemented:*
Unsupported atomic hardware update fault.

All other values are reserved.

For more information about the lookup level associated with a fault, see *The lookup level associated with MMU faults* on page D8-5190.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
ISS encoding for an exception due to SME functionality

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3.

Bits [24:3]

Reserved, RES0.

SMTC, bits [2:0]

SME Trap Code. Identifies the reason for instruction trapping.

- 0b000   Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, or CPTR_EL3.ESM, that is not reported using EC 0b000000.
- 0b001   Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.
- 0b010   SME instruction trapped because PSTATE.SM is 0.
- 0b011   SME instruction trapped because PSTATE.ZA is 0.

All other values are reserved.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR and SMCR_EL1 System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN and CPTR_EL2.TSM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2 at EL2, EL1, or EL0, trapped to EL2.
- CPTR_EL3.ESM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3 from all Exception levels and any Security state, trapped to EL3.

ISS encoding for an exception from a Granule Protection Check

Bits [24:22]

Reserved, RES0.

S2PTW, bit [21]

Indicates whether the Granule Protection Check exception was on an access made for a stage 2 translation table walk.

- 0  Fault not on a stage 2 translation table walk.
- 1  Fault on a stage 2 translation table walk.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**InD, bit [20]**

Indicates whether the Granule Protection Check exception was on an instruction or data access.
0b0 Data access.
0b1 Instruction access.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GPCSC, bits [19:14]**

Granule Protection Check Status Code.
0b000000 GPT address size fault at level 0.
0b000100 GPT walk fault at level 0.
0b000101 GPT walk fault at level 1.
0b001100 Granule protection fault at level 0.
0b001101 Granule protection fault at level 1.
0b010100 Synchronous External abort on GPT fetch at level 0.
0b010101 Synchronous External abort on GPT fetch at level 1.
All other values are reserved.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VNCR, bit [13]**

*When FEAT_NV2 is implemented:*

Indicates that the fault came from use of VNCb_EL2 register by EL1 code.
0b0 The fault was not generated by the use of VNCb_EL2, by an MRS or MSR instruction executed at EL1.
0b1 The fault was generated by the use of VNCb_EL2, by an MRS or MSR instruction executed at EL1.
This field is 0 in ESR_EL1.
When InD is '1', this field is RES0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**Bits [12:9]**

Reserved, RES0.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:
0b0 The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1 The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk:

- 0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.
- 0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

- 0b0 Abort caused by an instruction reading from a memory location.
- 0b1 Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:
• An External abort on an Atomic access.
• A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**xFSC, bits [5:0]**

Instruction or Data Fault Status Code.

- 0b100011 *When FEAT_RME is implemented and FEAT_LPA2 is implemented:* Granule Protection Fault on translation table walk or hardware update of translation table, level -1.
- 0b100100 *When FEAT_RME is implemented:* Granule Protection Fault on translation table walk or hardware update of translation table, level 0.
- 0b100101 *When FEAT_RME is implemented:* Granule Protection Fault on translation table walk or hardware update of translation table, level 1.
- 0b100110 *When FEAT_RME is implemented:* Granule Protection Fault on translation table walk or hardware update of translation table, level 2.
- 0b100111 *When FEAT_RME is implemented:* Granule Protection Fault on translation table walk or hardware update of translation table, level 3.
- 0b101000 *When FEAT_RME is implemented:*
Granule Protection Fault, not on translation table walk or hardware update of translation table.

All other values are reserved.

For more information about the lookup level associated with a fault, see *The lookup level associated with MMU faults on page D8-5190.*

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ISS encoding for an exception from a Data Abort**

![ISS encoding diagram](image)

When **FEAT_LS64_V** is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

When **FEAT_LS64_ACCDATA** is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

**ISV, bit [24]**

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

- **0b0** No valid instruction syndrome. ISS[23:14] are **RES0**.
- **0b1** ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when **FEAT_LS64** is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when **FEAT_LS64_V** is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when **FEAT_LS64_ACCDATA** is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- **AArch64** loads and stores of a single general-purpose register (including the register specified with **0b111111**, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- **AArch32** instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is **UNKNOWN** if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.
For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]**

*When ISV == 1:*

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**SSE, bit [21]**

*When ISV == 1:*

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.
When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### SRT, bits [20:16]

**When ISV == 1:**

Syndrome Register Transfer. The register number of the Wu/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states](#) on page D1-4684.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### SF, bit [15]

**When ISV == 1:**

SF

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

0b0  Instruction loads/stores a 32-bit general-purpose register.

0b1  Instruction loads/stores a 64-bit general-purpose register.

--- **Note** ---

This field specifies the register width identified by the instruction, not the Execution state.
When ISV == 0 and FEAT_SME is implemented:

FnP
- FAR not Precise.
- 0b0 The FAR holds the faulting virtual address that generated the Data Abort.
- 0b1 The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction in Streaming SVE mode, or an SME load/store instruction.

For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
- Reserved, RES0.

AR, bit [14]

When ISV == 1:
- Acquire/Release.
- 0b0 Instruction did not have acquire/release semantics.
- 0b1 Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
- Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:
- Indicates that the fault came from use of VNCR_EL2 register by EL1 code.
- 0b0 The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
- 0b1 The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
- Reserved, RES0.
LST, bits [12:11]

When \( DFSC == 0b00xxxx \) \&\& \( DFSC == 0b101011 \) \&\& \( DFSC != 0b0000xx \):

**LST**
Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

- **0b0**: The instruction that generated the Data Abort is not specified.
- **0b1**: When FEAT_LS64_V is implemented:
  An ST64BV instruction generated the Data Abort.
- **0b10**: When FEAT_LS64 is implemented:
  An LD64B or ST64B instruction generated the Data Abort.
- **0b11**: When FEAT_LS64_ACCDATA is implemented:
  An ST64BV0 instruction generated the Data Abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and \( DFSC == 0b010000 \):

**SET**
Synchronous Error Type. Used when a Synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

- **0b0**: Recoverable state (UER).
- **0b10**: Uncontainable (UC).
- **0b11**: Restartable state (UEO).

All other values are reserved.

---

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

---

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, **RES0**.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- **0b**: FAR is valid.
- **0b1**: FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is **0b010000**. It is **RES0** for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

0b0  The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1  The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0  Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1  Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

0b0  Abort caused by an instruction reading from a memory location.
0b1  Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:
- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

0b000000  Address size fault, level 0 of translation or translation table base register.
0b000001  Address size fault, level 1.
0b000010  Address size fault, level 2.
0b000011  Address size fault, level 3.
0b000100  Translation fault, level 0.
0b000101  Translation fault, level 1.
0b000110  Translation fault, level 2.
Translation fault, level 3.
Access flag fault, level 1.
Access flag fault, level 2.
Access flag fault, level 3.
When FEAT_LPA2 is implemented:
Access flag fault, level 0.
When FEAT_LPA2 is implemented:
Permission fault, level 0.
Permission fault, level 1.
Permission fault, level 2.
Permission fault, level 3.
Synchronous External abort, not on translation table walk or hardware update of translation table.
When FEAT_MTE2 is implemented:
Synchronous Tag Check Fault.
When FEAT_LPA2 is implemented:
Synchronous External abort on translation table walk or hardware update of translation table, level -1.
Synchronous External abort on translation table walk or hardware update of translation table, level 0.
Synchronous External abort on translation table walk or hardware update of translation table, level 1.
Synchronous External abort on translation table walk or hardware update of translation table, level 2.
Synchronous External abort on translation table walk or hardware update of translation table, level 3.
When FEAT_RAS is not implemented:
Synchronous parity or ECC error on memory access, not on translation table walk.
When FEAT_LPA2 is implemented and FEAT_RAS is not implemented:
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.
When FEAT_RME is implemented and FEAT_LPA2 is implemented:
Granule Protection Fault on translation table walk or hardware update of translation table, level -1.
When FEAT_RME is implemented:
Granule Protection Fault on translation table walk or hardware update of translation table, level 0.

0b100101  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 1.

0b100110  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 2.

0b100111  *When FEAT_RME is implemented:*
Granule Protection Fault on translation table walk or hardware update of translation table, level 3.

0b101000  *When FEAT_RME is implemented:*
Granule Protection Fault, not on translation table walk or hardware update of translation table.

0b101010  *When FEAT_LPA2 is implemented:*
Address size fault, level -1.

0b101011  *When FEAT_LPA2 is implemented:*
Translation fault, level -1.

0b110000  TLB conflict abort.

0b110001  *When FEAT_HAFDBS is implemented:*
Unsupported atomic hardware update fault.

0b110100  IMPLEMENTATION DEFINED fault (Lockdown).

0b110101  IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).

All other values are reserved.

For more information about the lookup level associated with a fault, see *The lookup level associated with MMU faults* on page D8-5190.

If the S1PTW bit is set, then the level refers the level of the stage 2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ISS encoding for an exception from a trapped floating-point exception**

---

**Bit [24]**

Reserved, RES0.

**TFV, bit [23]**

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

0b0  The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are **UNKNOWN**.
One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see Floating-point exceptions and exception traps on page A1-64.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

--- Note ---
This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]
Reserved, RES0.

VECITR, bits [10:8]
For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.
For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]
Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:
0b0   Input denormal floating-point exception has not occurred.
0b1   Input denormal floating-point exception occurred during execution of the reported instruction.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]
Reserved, RES0.

IXF, bit [4]
Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:
0b0   Inexact floating-point exception has not occurred.
0b1   Inexact floating-point exception occurred during execution of the reported instruction.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]
Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:
0b0   Underflow floating-point exception has not occurred.
0b1   Underflow floating-point exception occurred during execution of the reported instruction.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:
- 0b0 Overflow floating-point exception has not occurred.
- 0b1 Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:
- 0b0 Divide by Zero floating-point exception has not occurred.
- 0b1 Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:
- 0b0 Invalid Operation floating-point exception has not occurred.
- 0b1 Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:
• From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
• From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

<td></td>
</tr>
</tbody>
</table>

**IDS, bit [24]**

IMPLEMENTATION DEFINED syndrome.
- 0b0 Bits [23:0] of the ISS field holds the fields described in this encoding.

**Note**
If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.

- 0b1 Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.
Note
This field was previously called ISV.

Bits [23:14]
Reserved, RES0.

IESB, bit [13]
When FEAT_IESB is implemented and DFSC == 0b10001:
Implicit error synchronization event.
0b0 The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1 The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

AET, bits [12:10]
When FEAT_RAS is implemented and DFSC == 0b10001:
Asynchronous Error Type.
Describes the PE error state after taking the SError interrupt exception.
0b000 Uncontainable (UC).
0b001 Unrecoverable state (UEU).
0b010 Restartable state (UEO).
0b011 Recoverable state (UER).
0b110 Corrected (CE).
All other values are reserved.
If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note
Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EA, bit [9]
When FEAT_RAS is implemented and DFSC == 0b10001:
External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bits [8:6]
Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:
Data Fault Status Code.

0b000000 Uncategorized error.
0b010001 Asynchronous SError interrupt.
All other values are reserved.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

ISS encoding for an exception from execution of a Breakpoint instruction

Bits [24:16]
Reserved, RES0.

Comment, bits [15:0]
Set to the instruction comment field value, zero extended as necessary.
For the AArch32 BKPT instructions, the comment field is described as the immediate field.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see Breakpoint Instruction exceptions on page D2-4705.

ISS encoding for an exception from a TSTART instruction

Bits [24:10]
Reserved, RES0.

Rd, bits [9:5]
The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]
Reserved, RES0.
ISS encoding for an exception from Branch Target Identification instruction

Bits [24:2]
Reserved, RES0.

BTYPE, bits [1:0]
This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see Chapter B1 *The AArch64 Application Level Programmers’ Model*.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

Bits [24:0]
Reserved, RES0.

For more information about generating these exceptions, see:
- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

Bits [24:2]
Reserved, RES0.

Bit [1]
This field indicates whether the exception is as a result of an Instruction key or a Data key.
0b0 Instruction Key.
0b1 Data Key.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

0b0  A key.
0b1  B key.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

•  AUTIASP, AUTIAZ, AUTIA1716.
•  AUTIBSP, AUTIBZ, AUTIB1716.
•  AUTIA, AUTDA, AUTIB, AUTDB.
•  AUTIZA, AUTIZB, AUTDZA, AUTOZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

•  RETAA, RETAB.
•  BRAA, BRAB, BLRAA, BLRAB.
•  BRAAZ, BRABZ, BLRAAZ, BLRABZ.
•  ERETTA, ERETAB.
•  LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

D17.2.40 FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

**Purpose**
Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions, PC alignment fault exceptions and Watchpoint exceptions that are taken to EL1.

**Configurations**
AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (DFAR_NS).
AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (IFAR_NS).

**Attributes**
FAR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Faulting Virtual Address for synchronous exceptions taken to EL1</th>
</tr>
</thead>
</table>

Faultrng Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL1.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL1.FnV is 0, and FAR_EL1 is UNKNOWN if ESR_EL1.FnV is 1.

If a memory fault that sets FAR_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL1 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_EL1 are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.
When FEAT_SME is implemented, and the PE sets ESR_EL1.ISV to 0 and ESR_EL1.FnP to 1 on taking a Data Abort exception or Watchpoint exception, the PE sets FAR_EL1 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort or Watchpoint exception.

The naturally-aligned fault granule is one of:

- When ESR_EL1.DFSC is 0b010001, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL1.DFSC is 0b11010x, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL1 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^64 for stage 1, and the PARange for stage 2. The relevant translation granule is:
  — For MMU faults generated at stage 1, the current stage 1 translation granule.
  — For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
  — If FEAT_RME is implemented, for a synchronous data abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check failure, the value is the lowest address that failed the Tag Check within the block size of the load or store.
- For a Watchpoint exception, the value is an address range of the size defined by the DCZID_EL0.BS field. This address does not need to be the element with a watchpoint, but can be some earlier element.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see Address tagging on page D8-5162.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR_EL1 become UNKNOWN.

--- Note ---

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL1, FAR_EL1 is UNKNOWN.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing FAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

### MRS <Xt>, FAR_EL1

<table>

D17.2.41 FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions, PC alignment fault exceptions and Watchpoint exceptions that are taken to EL2.

**Configurations**

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDFAR[31:0].

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HIFAR[31:0].

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (DFAR_S) when EL2 is implemented.

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (IFAR_S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

FAR_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>Faulting Virtual Address for synchronous exceptions taken to EL2</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Faulting Virtual Address for synchronous exceptions taken to EL2</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL2.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_EL{<0|1>}.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

If a memory fault that sets FAR_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.
If the exception that updates FAR_EL2 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0xffffffff:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xffffffff. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When FEAT_SME is implemented, and the PE sets ESR_EL2.ISV to 0 and ESR_EL2.FnP to 1 on taking a Data Abort exception or Watchpoint exception, the PE sets FAR_EL2 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort or Watchpoint exception.

The naturally-aligned fault granule is one of:

- When ESR_EL2.DFSC is 0b010001, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL2.DFSC is 0b11010x, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MIPS is implemented, the value in FAR_EL2 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^64 for stage 1, and the PARange for stage 2. The relevant translation granule is:
  - For MMU faults generated at stage 1, the current stage 1 translation granule.
  - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
  - If FEAT_RME is implemented, for a synchronous data abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check failure, the value is the lowest address that failed the Tag Check within the block size of the load or store.
- For a Watchpoint exception, the value is an address range of the size defined by the DCZID_EL0.BS field. This address does not need to be the element with a watchpoint, but can be some earlier element.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see Address tagging on page D8-5162.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

--- Note ---

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.
For all other exceptions taken to EL2, FAR_EL2 is **UNKNOWN**.
FAR_EL2 is made **UNKNOWN** on an exception return from EL2.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing FAR_EL2

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `FAR_EL2` or `FAR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

#### MRS <Xt>, FAR_EL2

D17.2.42 FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions and PC alignment fault exceptions that are taken to EL3.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

**Attributes**

FAR_EL3 is a 64-bit register.

**Field descriptions**

Faulting Virtual Address for synchronous exceptions taken to EL3

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Faulting Virtual Address for synchronous exceptions taken to EL3</td>
</tr>
<tr>
<td>31</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). ESR_EL3.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

If a memory fault that sets FAR_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZV A.

If the exception that updates FAR_EL3 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When FEAT_SME is implemented, and the PE sets ESR_EL3.ISV to 0 and ESR_EL3.FnP to 1 on taking a Data Abort exception, the PE sets FAR_EL3 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort.
The naturally-aligned fault granule is one of:

- When ESR_EL3.DFSC is 0b010001, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL3.DFSC is 0b11010x, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL3 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^64 for stage 1, and the PARange for stage 2. The relevant translation granule is:
  - For MMU faults generated at stage 1, the current stage 1 translation granule.
  - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
  - If FEAT_RME is implemented, for a synchronous data abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check failure, the value is the lowest address that failed the Tag Check within the block size of the load or store.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see Address tagging on page D8-5162.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL2, EL1, or EL0 makes FAR_EL3 become UNKNOWN.

--- Note ---

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

---

For all other exceptions taken to EL3, FAR_EL3 is UNKNOWN.

FAR_EL3 is made UNKNOWN on an exception return from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL3

Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, FAR_EL3

\[

\]
**D17.2.43 FPEXC32_EL2, Floating-Point Exception Control register**

The FPEXC32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configurations**

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register FPEXC[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to FPEXC32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPEXC32_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>

</table>

**Bits [63:32]**

Reserved, RES0.

**EX, bit [31]**

Exception bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RAZ/WI.

**EN, bit [30]**

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

0b0 Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.

0b1 This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.
Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- **CPACR.cp10**, or, if executing at EL0, **CPACR_EL1.FPEN**.
- **FPEXC.EN**.
- If executing in Non-secure state:
  - **HCPTR.TCP10**, or if EL2 is using AArch64, **CPTR_EL2.TFP**.
  - **NSACR.cp10**, or if EL3 is using AArch64, **CPTR_EL3.TFP**.
- For Advanced SIMD instructions only:
  - **CPACR.ASEDIS**.
  - If executing in Non-secure state, **HCPTR.TASE** and **NSACR.NSTRCDIS**.

See the descriptions of the controls for more information.

--- Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64, then the Effective value of **FPEXC.EN** is 1.
- If EL2 is using AArch64 and is enabled in the current Security state, **HCR_EL2.TGE** is 1, and the Effective value of **HCR_EL2.RW** is 1, then the Effective value of **FPEXC.EN** is 1. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DEX, bit [29]**

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.

The meaning of this bit is:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and <strong>UNKNOWN</strong>. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and <strong>UNKNOWN</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>The exception was generated during the execution of an allocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.</td>
</tr>
</tbody>
</table>

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 **FPSCR.\{Stride, Len\}** fields as RAZ, this bit is **RES0**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**FP2V, bit [28]**

FPINST2 instruction valid bit. From Armv8, this bit is **RES0**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Access to this field is **RES0**.

**VV, bit [27]**

VECITR valid bit. From Armv8, this bit is **RES0**.
TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC32_EL2.DEX is 1. When valid, it indicates the cause of the exception and therefore whether FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are valid.

0b0  The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMUL, VNSQRT, or VSUB instruction when one or both of FPEXC32_EL2.{Stride, Len} was non-zero. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.

0b1  FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC32_EL2.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• When !ImpDefBool("Support trapping of floating-point exceptions"), access to this field is RAZ/WI.

• When ImpDefBool("Implemented FPSCR LEN, STRIDE as RAZ"), access to this field is RAO/WI.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RES1.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

0b0  Input Denormal exception has not occurred.

0b1  Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

0b0  Inexact exception has not occurred.
0b1  Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

0b0  Underflow exception has not occurred.
0b1  Underflow exception has occurred.

Underflow trapped exceptions can occur:
• On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
• Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

0b0  Overflow exception has not occurred.
0b1  Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

0b0  Divide by Zero exception has not occurred.
0b1  Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.
On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

- $0b0$ Invalid Operation exception has not occurred.
- $0b1$ Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D17.2.44   GCR_EL1, Tag Control Register.

The GCR_EL1 characteristics are:

**Purpose**
Tag Control Register.

**Configurations**
This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to GCR_EL1 are UNDEFINED.

**Attributes**
GCR_EL1 is a 64-bit register.

**Field descriptions**

**Bits [63:17]**
Reserved, RES0.

**RRND, bit [16]**
Controls generation of tag values by the IRG instruction.
0b0     IRG generates a tag value as defined by RandomTag().
0b1     IRG generates an implementation-specific tag value with a distribution of tag values no worse than generated with GCR_EL1.RRND == 0.

The reset behavior of this field is:
* On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Exclude, bits [15:0]**
Allocation Tag values excluded from selection by ChooseNonExcludedTag().
If all bits of GCR_EL1.Exclude are 1, then the Allocation Tag value 0 will be used.
The reset behavior of this field is:
* On a Warm reset, this field resets to an architecturally UNKNOWN value.

D17.2.46  HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

--- Note ---

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when HCR_EL2.{E2H, TGE} == {1, 1}.

**Configurations**

AArch64 System register HACR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

HACR_EL2 is a 64-bit register.

**Field descriptions**

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing HACR_EL2**

D17.2.47 HAFGRTR_EL2, Hypervisor Activity Monitors Fine-Grained Read Trap Register

The HAFGRTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MRS reads of Activity Monitors System registers.

**Configurations**

This register is present only when FEAT_AMUv1 is implemented and FEAT_FGT is implemented. Otherwise, direct accesses to HAFGRTR_EL2 are UNDEFINED.

**Attributes**

HAFGRTR_EL2 is a 64-bit register.

**Field descriptions**

**Bits [63:50]**

Reserved, RES0.

**AMEVTYPER1<\(x\)>_EL0, bit [19+2x], for x = 15 to 0**

*When AMEVTPERI<\(x\)> is implemented:*

AMEVTPERI<\(x\)>_EL0

Trap MRS reads of AMEVTPERI<\(x\)>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTPERI<\(x\)> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0 MRS reads of AMEVTPERI<\(x\)>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTPERI<\(x\)> at EL0 using AArch32 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} !={1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

- MRS reads of AMEVTYPE1\(n\)\_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MRC reads of AMEVTYPE1\(n\) at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

AMEVCTR1\(x\)\_EL0, bit \([18+2x]\), for \(x = 15\) to \(0\)

When AMEVCTR1\(x\) is implemented:

AMEVCNTR1\(x\)\_EL0

Trap MRS reads of AMEVCTR1\(x\)\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCTR1\(x\)\_EL0 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- MRS reads of AMEVCTR1\(x\)\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCTR1\(x\)\_EL0 at EL0 using AArch32 are not trapped by this mechanism.
- If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} !={1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:
  - MRS reads of AMEVCTR1\(x\)\_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MRC reads of AMEVCTR1\(x\) at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

AMCNTEN\(x\), bit \([17x]\), for \(x = 1\) to \(0\)

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of AMCNTENCLR\(x\)\_EL0 and AMCNTENSET\(x\).
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of AMCNTENCLR\(x\) and AMCNTENSET\(x\).

- The operations listed above are not trapped by this mechanism.
- If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} !={1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:
  - MRS reads at EL1 and EL0 using AArch64 of AMCNTENCLR\(x\)\_EL0 and AMCNTENSET\(x\)\_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MRC reads at EL0 using AArch32 of AMCNTENCLR\(x\) and AMCNTENSET\(x\) are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
Bits [16:5]

Reserved, RES0.

AMEVCNTR0<\texttt{x}>_EL0, bit \texttt{[x+1]}, for \texttt{x} = 3 to 0

Trap \texttt{MRS} reads of AMEVCNTR0<\texttt{n}>_EL0 at EL1 and EL0 using AArch64 and \texttt{MRC} reads of AMEVCNTR0<\texttt{n}>_EL0 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- \texttt{0b0} \texttt{MRS} reads of AMEVCNTR0<\texttt{n}>_EL0 at EL1 and EL0 using AArch64 and \texttt{MRC} reads of AMEVCNTR0<\texttt{n}> at EL0 using AArch32 are not trapped by this mechanism.
- \texttt{0b1} If EL2 is implemented and enabled in the current Security state, HCR_EL2.\{E2H, TGE\} \neq \{1, 1\}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn = 1, then, unless the read generates a higher priority exception:
  - \texttt{MRS} reads of AMEVCNTR0<\texttt{n}>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
  - \texttt{MRC} reads of AMEVCNTR0<\texttt{n}> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

    elsif EL2Enabled() & HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
    elsif PSTATE_EL == EL2 then
        if Halted() & HaveEL(EL3) & EDSCR.SDD == '1' & boolean IMPLEMENTATION_DEFINED "EL3 trap priority
          when SDD == '1"
          & SCR_EL3.FGTEn == '0' then
            UNDEFINED;
        elsif HaveEL(EL3) & SCR_EL3.FGTEn == '0' then
            if Halted() & EDSCR.SDD == '1' then
                UNDEFINED;
            else
                AArch64.SystemAccessTrap(EL3, 0x18);
            end
        else
            HAFGRTR_EL2 = X[t, 64];
    elsif PSTATE_EL == EL3 then
        HAFGRTR_EL2 = X[t, 64];
    else
        HAFGRTR_EL2 = X[t, 64];
D17.2.48 HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

**Configurations**

AArch64 System register HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCR[31:0].

AArch64 System register HCR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HCR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

**Attributes**

HCR_EL2 is a 64-bit register.

**Field descriptions**

**TWEDEL, bits [63:60]**

*When FEAT_TWED is implemented:*

TWE Delay. A 4-bit unsigned number that, when HCR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by HCR_EL2.TWE as \(2^{(TWEDEL + 8)}\) cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.
TWEDEn, bit [59]

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by HCR_EL2.TWE.

0b0   The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1   The delay for taking the trap is at least the number of cycles defined in HCR_EL2.TWEDEL.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]

When FEAT_MTE2 is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:
AArch64:

• GMID_EL1.

0b0   This control does not cause any instructions to be trapped.
0b1   The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]

When FEAT_MTE2 is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

0b0   Stage 1 translations are treated as Untagged.
0b1   Stage 1 translations are treated as Tagged.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]

When FEAT_MTE2 is implemented:

Allocation Tag Access. When HCR_EL2.{E2H,TGE} != {1,1}, controls access to Allocation Tags, System registers for Memory tagging, and prevention of Tag checking, at EL1 and EL0.

0b0   Access to Allocation Tags is prevented at EL1 and EL0.

Accesses at EL1 to GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2, or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2.

Memory accesses at EL1 and EL0 are not subject to a Tag Check operation.

0b1   This control does not prevent access to Allocation Tags at EL1 and EL0.
This control does not prevent Tag checking at EL1 and EL0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TTLBOS, bit [55]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- TLBI VMALLE1OS, TLBI VMALLE1OSNXS, TLBI VAE1OS, TLBI VAEL1OSNXS, TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLBI VAAE1OS, TLBI VAEL1OS, TLBI VAEE1OSNXS, TLBI VAAE1OSNXS, TLBI VAAE1OS, TLBI VAEE1OSNXS, TLBI VAAE1OSNXS, TLBI VAAE1OS, TLBI VAEE1OSNXS, TLBI VAAE1OSNXS, TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLBI RVAAE1OS, TLBI RVAAE1OSNXS, and TLBI RVAAE1OSNXS.

0b0  This control does not cause any instructions to be trapped.
0b1  Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TTLBIS, bit [54]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLBI VAEL1IS, TLBI VAEL1ISNXS, TLBI VAAE1IS, TLBI VAEL1ISNXS, TLBI VAAE1ISNXS, TLBI VAAE1IS, TLBI VAEL1ISNXS, TLBI VAAE1ISNXS, TLBI VAAE1IS, TLBI VAEL1ISNXS, TLBI VAAE1ISNXS, TLBI VAAE1IS, TLBI VAEL1ISNXS, TLBI VAAE1ISNXS, TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLBI RVAAE1IS, TLBI RVAAE1ISNXS, and TLBI RVAAE1IS, TLBI RVAAE1ISNXS.
- When EL1 is using AArch32, TLBIALL1IS, TLBIMVAI3, TLBIASID1IS, TLBIMVAI3IS, TLBIASID1IS, and TLBIMVAI3IS.

0b0  This control does not cause any instructions to be trapped.
0b1  Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
EnSCXT, bit [53]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable Access to the SCXTNUM_EL1 and SCXTNUM_EL0 registers. The defined values are:

- **0b0**  When HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, and EL2 is enabled in the current Security state, EL1 and EL0 access to SCXTNUM_EL0 and EL1 access to SCXTNUM_EL1 is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0.

- **0b1**  This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

TOCU, bit [52]

When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When SCTLR_EL1.UCI is 1, HCR_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, IC IV AU, DC CV AU.

- When EL1 is using AArch64, IC IVAU, IC IALLU, DC CVAU.

- When EL1 is using AArch32, ICIMVAU, ICIALLU, DCCMVAU.

_____ **Note** ______

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.

- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

- **0b0**  This control does not cause any instructions to be trapped.

- **0b1**  Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
AMVOFFEN, bit [51]

**When FEAT_AMUv1p1 is implemented:**
Activity Monitors Virtual Offsets Enable.

- **0b0** Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
- **0b1** Virtualization of the Activity Monitors is enabled.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

TICAB, bit [50]

**When FEAT_EVT is implemented:**
Trap ICIAULLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, IC IALLUIS.
- When EL1 is using AArch32, ICIAULLUIS.

- **0b0** This control does not cause any instructions to be trapped.
- **0b1** EL1 execution of the specified instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

TID4, bit [49]

**When FEAT_EVT is implemented:**
Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

**AArch64:**
- EL1 reads of CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1.
- EL1 writes to CSSELR_EL1.

**AArch32:**
- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

- **0b0** This control does not cause any instructions to be trapped.
- **0b1** The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
**GPF, bit [48]**

_When FEAT_RME is implemented:_

Controls the reporting of Granule protection faults at EL0 and EL1.

- **0b0** This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
- **0b1** Instruction Abort exceptions and Data Abort exceptions due to GPFs from EL0 and EL1 are routed to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**FIEN, bit [47]**

_When FEAT_RASv1p1 is implemented:_

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

- **0b0** Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
- **0b1** This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is **0b1**.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**FWB, bit [46]**

_When FEAT_S2FWB is implemented:_

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

**Note**

When FEAT_MTE is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.

- **0b0** When this bit is 0, then:
  - The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see _Stage 2 memory type and Cacheability attributes when FEAT_S2FWB is disabled_ on page D8-5153.
  - The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.

- **0b1** When this bit is 1, then:
  - Bit[5] of stage 2 page or block descriptor is RES0.
• When bit[4] of stage 2 page or block descriptor is 1 and when:
  — Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute.
  — Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back.
  — Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device-<attr> the resultant memory type will be Device-<attr>.
• When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when:
  — Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE.
  — Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE.
  — Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE.
  — Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE.
• If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.
• If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.

The stage 1 and stage 2 memory types are combined in the manner described in *Stage 2 memory type and Cacheability attributes when FEAT_S2FWB is disabled* on page D8-5153.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NV2, bit [45]**

*When FEAT_NV2 is implemented:*

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

- **0b0** This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
- **0b1** Redefines behavior of HCR_EL2{NV1, NV} to enable:
  - Transformation of read/writes to registers into read/writes to memory.
  - Redirection of EL2 registers to EL1 registers.

Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

When HCR_EL2.NV is 0, the Effective value of this field is 0 and this field is treated as 0 for all purposes other than direct reads and writes of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

AT, bit [44]

When FEAT_NV is implemented:
Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:
- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP.

0b0 This control does not cause any instructions to be trapped.
0b1 EL1 execution of the specified instructions is trapped to EL2.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NV1, bit [43]

When FEAT_NV2 is implemented:
Nested Virtualization.
0b0 If HCR_EL2.{NV2, NV} are both 1, accesses executed from EL1 to implemented EL2, EL02, or EL2 registers are transformed to loads and stores.
If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2, NV} == {1, 0}, this control does not cause any instructions to be trapped.
0b1 If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores.
If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see Enhanced support for nested virtualization on page D8-5175.

If HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
• When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.

• When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV1, NV} are \{1, 0\}, then the behavior is a constrained unpredictable choice of:

• Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.

• Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.

• Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally unknown value.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0, then the following effects also apply:

• Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.NV and HCR_EL2.NV1 are both set to 1, then the following effects also apply:

• The EL1 translation table Block and Page descriptors:
  — Bit[54] holds the PXN instead of the UXN.
  — Bit[53] is RES0.
  — Bit[6] is treated as 0 regardless of the actual value.

• If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  — Bit[61] is treated as 0 regardless of the actual value.
  — Bit[60] holds the PXNTable instead of the UXNTable.
  — Bit[59] is RES0.

• When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.

• When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1, then the behavior is a constrained unpredictable choice of:

• Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.

• Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.

• Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**NV, bit [42]**

**When FEAT_NV2 is implemented:**

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers SPSR_EL2 and ELR_EL2 instead access SPSR_EL1 and ELR_EL1 respectively.
- Instructions accessing the System registers ESR_EL2 and FAR_EL2 instead access ESR_EL1 and FAR_EL1.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, traps functionality that is permitted at EL2 and would be **UNDEFINED** at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not **UNDEFINED** at EL2.
- EL1 accesses to System registers that are not **UNDEFINED** at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

0b0 When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped.

When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.

0b1 When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2, ELR_EL2, ESR_EL2, and FAR_EL2 instead access SPSR_EL1, ELR_EL1, ESR_EL1, and FAR_EL1 respectively.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
  - Registers accessed using MRS or MSR with a name ending in _EL12.
  - Registers accessed using MRS or MSR with a name ending in _EL02.
  - Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.
  - Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
The instructions for which the execution is trapped as follows:
- SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
- The ERET, ERETTAA, and ERETTAB instructions, reported using EC syndrome value 0x1A.

--- Note ---

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETTAA or ERETTAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*When FEAT_NV is implemented:*

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:
- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

0b0  This control does not cause any instructions to be trapped.
0b1  EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
- Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.
- Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETTAA, and ERETTAB instructions are trapped and reported using EC syndrome value 0x1A.

--- Note ---

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETTAA or ERETTAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**API, bit [41]**

When *FEAT_PAuth* is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M>=1.
- In EL1, the associated SCTLR_EL1.En<N><M>=1.

Traps are reported using EC syndrome value 0x09. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETTAA, ERETTAB, LDRAA, and LDRAB.

0b0  The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from:

- EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0.
- EL1.

If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETTA and ERETTB instructions.

If EL2 is implemented and enabled in the current Security state and *HFGITR_EL2.ERET==1*, execution at EL1 using AArch64 of ERETTA or ERETTB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0.

0b1  This control does not cause any instructions to be trapped.

If FEAT_PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**APK, bit [40]**

When *FEAT_PAuth* is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1, APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1, APGAKeyLo_EL1, and APGAKeyHi_EL1.

0b0  Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.

0b1  This control does not cause any instructions to be trapped.
Note

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TME, bit [39]

When FEAT_TME is implemented:
Enables access to the TSTART, TCOMMIT, TTEST, and TCANCEL instructions at EL0 and EL1.
- 0b0 EL0 and EL1 accesses to TSTART, TCOMMIT, TTEST, and TCANCEL instructions are UNDEFINED.
- 0b1 This control does not cause any instruction to be UNDEFINED.

If EL2 is not implemented or is disabled in the current Security state, the Effective value of this bit is 0b1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

MIOCNCE, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.
- 0b0 For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
- 0b1 For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information, see Mismatched memory attributes on page B2-208.
This field can be implemented as RAZ/WI.
When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TEA, bit [37]

When FEAT_RAS is implemented:
Route synchronous External abort exceptions to EL2.
- 0b0 This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
- 0b1 Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
TERR, bit [36]

When FEAT_RAS is implemented:

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ERRIDR_EL1, ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXF_R_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
  - When FEAT_RASv1p1 is implemented, ERXMISC2_EL1, and ERXMISC3_EL1.

- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXF_R, ERXF_R2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
  - When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

0b0 This control does not cause any instructions to be trapped.
0b1 Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]

When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure EL1 accesses to LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers to EL2.

0b0 This control does not cause any instructions to be trapped.
0b1 Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]

When FEAT_VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

0b0 The facilities to support a Host Operating System at EL2 are disabled.
0b1 The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see Behavior of HCR_EL2.E2H on page D8-5168.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
ID, bit [33]
Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

0b0  This control has no effect on stage 2 of the EL1&0 translation regime.
0b1  Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:
•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]
Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

0b0  This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1  Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:
•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]

When EL1 is capable of using AArch32:
Execution state control for lower Exception levels:

0b0  Lower levels are all AArch32.
0b1  The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RAO/WI.
TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18.
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

0b0  This control does not cause any instructions to be trapped.
0b1  EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

——— Note ————

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

——————

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

0b0  HVC instruction execution is enabled at EL2 and EL1.
0b1  HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

——— Note ————

HVC instructions are always UNDEFINED at EL0.

——————

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Trap DC ZVA instructions. Traps EL0 and EL1 execution of DC ZVA instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If FEAT_MTE is implemented, this trap also applies to DC GVA and DC GZVA.

0b0  This control does not cause any instructions to be trapped.
In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state.

Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TGE, bit [27]**

Trap General Exceptions, from EL0.

- **0b0** This control has no effect on execution at EL0.
- **0b1** When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0.

When EL2 is enabled in the current Security state, in all cases:

- All exceptions that would be routed to EL1 are routed to EL2.
- If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1.
- If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR.
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.
- An exception return to EL1 is treated as an illegal exception return.
- The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2.

In addition, when EL2 is enabled in the current Security state, if:

- HCR_EL2.E2H is 0, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1.
- HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0.

For further information on the behavior of this bit when E2H is 1, see *Behavior of HCR_EL2.E2H* on page D8-5168.

HCR_EL2.TGE must not be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TVM, bit [26]**

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
• If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
  
  — SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFRS, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

0b0  This control does not cause any instructions to be trapped.

0b1  EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

• When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  
  — TLBI VMALLE1, TLBI VMALLE1NXS, TLBI VAE1, TLBI VAE1NXS, TLBI ASIDE1, TLBI ASIDE1NXS, TLBI VAAE1, TLBI VAAC1NXS, TLBI VALE1, TLBI VALE1NXS, TLBI VAAE1, TLBI VALE1NXS.

  — TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLBI VAEE1IS, TLBI VAEE1ISNXS, TLBI ASIDE1IS, TLBI ASIDE1ISNXS, TLBI VAAE1IS, TLBI VAAE1ISNXS, TLBI VAAE1IS, TLBI VAAE1ISNXS.

  — If FEAT_TLBIOS is implemented, this trap applies to TLBI VMALLE1OS, TLBI VMALLE1OSNXS, TLBI VAE1OS, TLBI VAE1OSNXS, TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLBI VAAE1OS, TLBI VAAE1OSNXS, TLBI VAAE1OS, TLBI VAAE1OSNXS.

  — If FEAT_TLBIRANGE is implemented, this trap applies to TLBI RVAE1, TLBI RVAE1NXS, TLBI RVAE1NXS, TLBI RVVAE1NXS, TLBI RVVAE1NXS, TLBI RVAAE1NXS, TLBI RVAAE1NXS, TLBI RVAAE1NXS, TLBI RVAAE1NXS.

  — If FEAT_TLBIRANGE is implemented, this trap applies to TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLBI RVAAE1OSNXS, TLBI RVAAE1OSNXS, TLBI RVAAE1OSNXS, TLBI RVAAE1OSNXS, TLBI RVAAE1OSNXS, TLBI RVAAE1OSNXS.

• When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  
  — TLBIALLIS, TLBIMVAIS, TLBIASDIS, TLBIMVAAS, TLBIMVALIS, TLBIMVALLS.

  — TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVALL.

  — ITLBIAII, ITLBIMVA, ITLBIAIS.

  — DTLBIAII, DTLBIMVA, DTLBIAIS.

0b0  This control does not cause any instructions to be trapped.

0b1  EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.
--- Note ---
The TLB maintenance instructions are UNDEFINED at EL0.

---

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]
Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, DC CVAU. If the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, IC IALLU, IC IALLUIS, DC CVAU.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - ICIMV AU, IC IALLU, IC IALLUIS, DCCMV AU.

--- Note ---
An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMV AU, IC IALLU, IC IALLUIS, and DCCMV AU are always UNDEFINED at EL0 using AArch32.

0b0 This control does not cause any instructions to be trapped.
0b1 Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

When FEAT_DPB is implemented:

TPCP
Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - DC CIVAC, DC CVAC, DC CVAP. If the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x83:
  - DC IVAC, DC CIVAC, DC CVAC, DC CVAP.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - DCIMVAC, DCCIMVAC, DCCMVAC.

If FEAT_DPB2 is implemented, this trap also applies to DC CVADP.
If FEAT_MTE is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP and DC CGDVAP.
If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

**Note**
- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

- **0b0** This control does not cause any instructions to be trapped.
- **0b1** Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If HCR_EL2.{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

**TPC**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - DC CIVAC, DC CVAC. However, if the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to DC IVAC, DC CIVAC, DC CVAC are trapped and reported using EC syndrome value 0x18.
• When EL1 is using AArch32, accesses to DCIMVAC, DCCIMVAC, and DCCMVAC are trapped and reported using EC syndrome value 0x03.

——— Note ————
• An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  — AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  — DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.
• In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

0b0  This control does not cause any instructions to be trapped.
0b1  Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the Point of coherency can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]
Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state as follows:
• If EL1 is using AArch64 state, accesses to DCISW, DCCSW, DC CISW are trapped to EL2, reported using EC syndrome value 0x18.
• If EL1 is using AArch32 state, accesses to DCISW, DCCSW, DCCISW are trapped to EL2, reported using EC syndrome value 0x83.

If FEAT_MTE is implemented, this trap also applies to DC IGSW, DC IGDSW, DC CGSW, DC CGDSW, DC CIGSW, and DC CIGDSW.

——— Note ————
An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

0b0  This control does not cause any instructions to be trapped.
0b1  Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]
Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:
• If EL1 is using AArch64 state, accesses to ACTLR_EL1 to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
• If EL1 is using AArch32 state, accesses to ACTLR and, if implemented, ACTLR2 are trapped to EL2 and reported using EC syndrome value 0x03.

0b0  This control does not cause any instructions to be trapped.

0b1  EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

——— Note ————
ACTLR_EL1 is not accessible at EL0.
ACTLR and ACTLR2 are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

• In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
  — IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  — IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.

• In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
  — All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  — All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  — All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When this functionality is accessed from EL0:
• If FEAT_TIDCP1 is implemented and the Effective value of SCTLR_EL1.TIDCP is 1, any accesses from EL0 are trapped to EL1.
• Otherwise, if FEAT_TIDCP1 is implemented and the Effective value of SCTLR_EL2.TIDCP is 1, any accesses from EL0 are trapped to EL2.
• Otherwise:
  — If HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any accesses from EL0 are trapped to EL2.
  — If HCR_EL2.TIDCP is 0, any accesses from EL0 are UNDEFINED and generate an exception that is taken to EL1 or EL2.

0b0  This control does not cause any instructions to be trapped.

0b1  EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.
### Note

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

#### Note

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

0b0 This control does not cause any instructions to be trapped.

0b1 If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD.

If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 0, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state.

If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:
- Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state.
- Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether this bit is:
- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:
- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ID_PFR0_EL1, ID_PFR1_EL1, ID_PFR2_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFRO_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, MVFR2_EL1.
ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, ID_AA64AFR1_EL1.

If FEAT_FGT is implemented:

- ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2.
- ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2.
- ID_DFR1_EL1 is trapped to EL2.
- ID_AA64ZFR0_EL1 is trapped to EL2.
- ID_AA64SMFR0_EL1 is trapped to EL2.
- ID_AA64ISAR2_EL1 is trapped to EL2.

This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == \{c1-c7\}, op2 == \{0-7\}.

If FEAT_FGT is not implemented:

- ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4_EL1 or ID_MMFR5_EL1 are trapped to EL2.
- ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID-AA64MMFR2_EL1 or ID_ISAR6_EL1 are trapped to EL2.
- ID_DFR1_EL1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1_EL1 are trapped to EL2.
- ID_AA64ZFR0_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ZFR0_EL1 are trapped to EL2.
- ID_AA64SMFR0_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64SMFR0_EL1 are trapped to EL2.
- ID_AA64ISAR2_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ISAR2_EL1 are trapped to EL2.

Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == \{c1-c7\}, op2 == \{0-7\}.

In AArch32 state:

- VMRS access to MVFR0, MVFR1, and MVFR2, are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
  - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5.

  If FEAT_FGT is implemented:
  - ID_MMFR4 and ID_MMFR5 are trapped to EL2.
  - ID_ISAR6 is trapped to EL2.
  - ID_DFR1 is trapped to EL2.
— This field traps all MRC accesses to encodings in the following range that are
not already mentioned in this field description: coproc == p15, opc1 == 0, CRn
== c0, CRm == {c2-c7}, opc2 == {0-7}.

— If FEAT_FGT is not implemented:
  — ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ,
    when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or
    ID_MMFR5 are trapped.
  — ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is
    IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
  — ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is
    IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
  — Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC
    accesses to registers in the following range not already mentioned in this field
    description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2
    == {0-7}.

0b0  This control does not cause any instructions to be trapped.
0b1  The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2
     is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct
read of this field.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]
Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current
Security state, as follows:
• If EL1 is using AArch64, reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1,
  and CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
• If EL0 is using AArch64 and the value of SCTLR_EL1.UCT is not 0, reads of CTR_EL0 are
  trapped to EL2, reported using EC syndrome value 0x18. If the value of SCTLR_EL1.UCT
  is 0, then EL0 reads of CTR_EL0 are trapped to EL1 and the resulting exception takes
  precedence over this trap.
• If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC
  syndrome value 0x18.
• If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are
  trapped to EL2, reported using EC syndrome value 0x03.
• If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome
  value 0x03.

0b0  This control does not cause any instructions to be trapped.
0b1  The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when
     EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field
behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]
Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current
Security state as follows:
• In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, SMIDR_EL1, reported using EC
  syndrome value 0x18.
In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, AIDR, reported using EC syndrome value 0x03.

0b0  This control does not cause any instructions to be trapped.
0b1  The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]

When AArch32 is supported:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

--- Note ---

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0, then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

0b0  This control does not cause any instructions to be trapped.
0b1  The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

0b0  This control does not cause any instructions to be trapped.
0b1  Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.
Note
Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see Wait for Event on page D1-4676.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]
Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

0b0  This control does not cause any instructions to be trapped.

0b1  Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

Note
Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see Wait for Interrupt mechanism on page D1-4678.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DC, bit [12]
Default Cacheability.

0b0  This control has no effect on the EL1&0 translation regime.

0b1  In any Security state:

- When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1.

- When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR.

- The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2.

- The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.
This field has no effect on the EL2, EL2&0, and EL3 translation regimes.
This bit is permitted to be cached in a TLB.
When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this field.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BSU, bits [11:10]**
Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>No effect.</td>
</tr>
<tr>
<td>01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>11</td>
<td>Full system.</td>
</tr>
</tbody>
</table>

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.
When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 00 for all purposes other than a direct read of the value of this bit.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FB, bit [9]**
Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

- AArch32: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVA, ICIALLU, TLBIMVAL, TLBIMVAAL.
- AArch64: TLB VMALLE1, TLB VMALLE1NXS, TLB VAE1, TLB VAE1NXS, TLB ASIDE1, TLB ASIDE1NXS, TLB VAAE1, TLB VAAE1NXS, TLB VALE1, TLB VALE1NXS, TLB VAAE1, TLB VAAE1NXS, TLB VAE1, TLB VAE1NXS, TLB VALE1, TLB VALE1NXS, TLB VAAE1NXS, TLB VAAE1NXS, TLB VAE1NXS, TLB VALE1NXS.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This field has no effect on the operation of the specified instructions.</td>
</tr>
<tr>
<td>1</td>
<td>When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VSE, bit [8]**
Virtual SError interrupt.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This mechanism is not making a virtual SError interrupt pending.</td>
</tr>
<tr>
<td>1</td>
<td>A virtual SError interrupt is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual SError interrupt is enabled only when the value of HCR_EL2.{TGE, AMO} is \{0, 1\}.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VI, bit [7]**
Virtual IRQ Interrupt.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This mechanism is not making a virtual IRQ pending.</td>
</tr>
</tbody>
</table>

VF, bit [6]

Virtual FIQ Interrupt.

0b0  This mechanism is not making a virtual FIQ pending.

0b1  A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError interrupt routing.

0b0  When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:
• When the value of HCR_EL2.TGE is 0, Physical SError interrupts are not taken to EL2.
• When the value of HCR_EL2.TGE is 1, Physical SError interrupts are taken to EL2 unless they are routed to EL3.
• Virtual SError interrupts are disabled.

0b1  When executing at any Exception level, and EL2 is enabled in the current Security state:
• Physical SError interrupts are taken to EL2, unless they are routed to EL3.
• When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:
• Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
• When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see Establishing the target Exception level of an asynchronous exception on page D1-4657.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

0b0  When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:
• When the value of HCR_EL2.TGE is 0, Physical IRQ interrupts are not taken to EL2.
• When the value of HCR_EL2.TGE is 1, Physical IRQ interrupts are taken to EL2 unless they are routed to EL3.
• Virtual IRQ interrupts are disabled.

0b1  When executing at any Exception level, and EL2 is enabled in the current Security state:
• Physical IRQ interrupts are taken to EL2, unless they are routed to EL3.

A virtual IRQ is pending because of this mechanism.
The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
• When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.
If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:
• Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
• When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see *Establishing the target Exception level of an asynchronous exception on page D1-4657.*

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

### FMO, bit [3]
Physical FIQ Routing.

- **0b0** When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:
  • When the value of HCR_EL2.TGE is 0, Physical FIQ interrupts are not taken to EL2.
  • When the value of HCR_EL2.TGE is 1, Physical FIQ interrupts are taken to EL2 unless they are routed to EL3.
  • Virtual FIQ interrupts are disabled.
- **0b1** When executing at any Exception level, and EL2 is enabled in the current Security state:
  • Physical FIQ interrupts are taken to EL2, unless they are routed to EL3.
  • When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:
• Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
• When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see *Establishing the target Exception level of an asynchronous exception on page D1-4657.*

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PTW, bit [2]
Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

- **0b0** The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
- **0b1** The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SWIO, bit [1]**

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

- 0b0 This control has no effect on the operation of data cache invalidate by set/way instructions.
- 0b1 Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:
AArch32: DCISW performs the same invalidation as a DCCISW instruction.
AArch64: DCISW performs the same invalidation as a DC CISW instruction.
This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VM, bit [0]**

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

- 0b0 EL1&0 stage 2 address translation disabled.
- 0b1 EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing HCR_EL2**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, HCR_EL2**

D17.2.49  HCRX_EL2, Extended Hypervisor Configuration Register

The HCRX_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configurations

This register is present only when FEAT_HCX is implemented. Otherwise, direct accesses to HCRX_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if:

• EL2 is not enabled in the current Security state.
• SCR_EL3.HXEn is 0.

Attributes

HCRX_EL2 is a 64-bit register.

Field descriptions

Bits [63:12]

Reserved, RES0.

MSCEn, bit [11]

When FEAT_MOPS is implemented:

Memory Set and Memory Copy instructions Enable. Enables execution of the CPY*, SETG*, SETP*, SETM*, and SETE* instructions at EL1 or EL0.

0b0 Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL1 or EL0.

0b1 This control does not cause any instructions to be UNDEFINED.

This bit behaves as if it is 1 if any of the following are true:

• EL2 is not implemented or enabled.
• The value of HCR_EL2.{E2H, TGE} is {1, 1}.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
MCE2, bit [10]

*When FEAT_MOPS is implemented:*

Controls Memory Copy and Memory Set exceptions generated as part of attempting to execute the Memory Copy and Memory Set instructions from EL1.

0b0  Memory Copy and Memory Set exceptions generated from EL1 are taken to EL1.

0b1  Memory Copy and Memory Set exceptions generated from EL1 are taken to EL2.

When the value of `HCR_EL2.{E2H, TGE}` is {1, 1}, this control does not affect any exceptions due to the higher priority `SCTLR_EL2.MSCEn` control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

CMOW, bit [9]

*When FEAT_CMOW is implemented:*

Controls cache maintenance instruction permission for the following instructions executed at EL1 or EL0.

- IC IVAU, DC CIVAC, DC CIGDVAC and DC CIGVAC.
- ICIMVAC, DCCIMVAC.

0b0  These instructions executed at EL1 or EL0 with stage 2 read permission, but without stage 2 write permission do not generate a stage 2 permission fault.

0b1  These instructions executed at EL1 or EL0, if enabled as a result of `SCTLR_EL1.UCI==1`, with stage 2 read permission, but without stage 2 write permission generate a stage 2 permission fault.

For this control, stage 2 has write permission if S2AP[1] is 1 or DBM is 1 in the stage 2 descriptor. The instructions do not cause an update to the dirty state.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

VFNMI, bit [8]

*When FEAT_NMI is implemented:*

Virtual FIQ Interrupt with Superpriority. Enables signaling of virtual FIQ interrupts with Superpriority.

0b0  When `HCR_EL2.VF` is 1, a signaled pending virtual FIQ interrupt does not have Superpriority.

0b1  When `HCR_EL2.VF` is 1, a signaled pending virtual FIQ interrupt has Superpriority.

When `HCR_EL2.VF` is 0, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

*Otherwise:*

Reserved, RES0.
VINMI, bit [7]

When FEAT_NMI is implemented:

Virtual IRQ Interrupt with Superpriority. Enables signaling of virtual IRQ interrupts with Superpriority.

0b0 When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt does not have Superpriority.

0b1 When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt has Superpriority.

When HCR_EL2.VI is 0, this bit has no effect.

The reset behavior of this field is:

• On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]

When FEAT_NMI is implemented:

Trap MSR writes of ALLINT at EL1 using AArch64 to EL2, when EL2 is implemented and enabled in the current Security state, reported using EC syndrome value 0x18.

0b0 MSR writes of ALLINT are not trapped by this mechanism.

0b1 MSR writes of ALLINT at EL1 using AArch64 are trapped to EL2.

The reset behavior of this field is:

• On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

SMPME, bit [5]

When FEAT_SME is implemented:

Streaming Mode Priority Mapping Enable.

Controls mapping of the value of SMPRI_EL1.Priority for streaming execution priority at EL0 or EL1.

0b0 The effective priority value is taken from SMPRI_EL1.Priority.

0b1 The effective priority value is:

• When the current Exception level is EL2 or EL3, the value of SMPRI_EL1.Priority.

• When the current Exception level is EL0 or EL1, the value of the SMPRIMAP_EL2 field corresponding to the value of SMPRI_EL1.Priority.

When SMIDR_EL1.SMPS is '0', this field is RES0.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
FGTnXS, bit [4]

When FEAT_XS is implemented:
Determine if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

0b0  The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.

0b1  The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

The reset behavior of this field is:
•  On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:
Reserved, RES0.

FnXS, bit [3]

When FEAT_XS is implemented:
Determines the behavior of TLBI instructions affected by the XS attribute.
This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

0b0  This control does not have any effect on the behavior of the TLBI maintenance instructions.

0b1  A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier.
An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:
•  On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:
Reserved, RES0.

EnASR, bit [2]

When FEAT_LS64_V is implemented:
When HCR_EL2.{E2H, TGE} !={1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

0b0  Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnASR.
Execution of an ST64BV instruction at EL1 is trapped to EL2.

0b1  This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:
•  On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.
EnALS, bit [1]

When FEAT_LS64 is implemented:

When HCR_EL2.[E2H, TGE] != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

0b0   Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnALS.

0b1   This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

EnAS0, bit [0]

When FEAT_LS64_ACCDATA is implemented:

When HCR_EL2.[E2H, TGE] != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

0b0   Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnAS0.

0b1   This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Accessing HCRX_EL2

D17.2.50 HDFGRTR_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

**Configurations**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

**Attributes**

HDFGRTR_EL2 is a 64-bit register.

**Field descriptions**

When FEAT_SPE is implemented:

Traps MRS reads of PMBIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of PMBIDR_EL1 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

nPMSNEVFR_EL1, bit [62]

When FEAT_SPEv1p2 is implemented:

Trap MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

nBRBDATA, bit [61]

When FEAT_BRBE is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
- BRBINF<n>_EL1.
- BRBINFINJ_EL1.
- BRBSRC<n>_EL1.
- BRBSRCINJ_EL1.
- BRBTGT<n>_EL1.
- BRBTGTINJ_EL1.
- BRBTS_EL1.

If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

nBRBCTL, bit [60]

When FEAT_BRBE is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
- BRBCR_EL1.
• **BRBFCR_EL1.**

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

0b1  MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**nBRBIDR, bit [59]**

*When FEAT_BRBE is implemented:*

Trap MRS reads of BRBIDR0_EL1 at EL1 using AArch64 to EL2.

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of BRBIDR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

0b1  MRS reads of BRBIDR0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCEIDn_EL0, bit [58]**

*When FEAT_PMUv3 is implemented:*

Trap MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

• MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.

• MRC reads of PMCEID<n> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMUSERENR_EL0, bit [57]**

*When FEAT_PMUv3 is implemented:*

Trap MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSEREN at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSEREN at EL0 using AArch32 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

- MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MRC reads of PMUSERENR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x83.

The reset behavior of this field is:

- **If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:**
  - **MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.**
  - **MRC reads of PMUSERENR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x83.**

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRBTRG_EL1, bit [56]**

*When FEAT_TRBE is implemented:*

- Trap MRS reads of TRBTRG_EL1 at EL1 using AArch64 to EL2.
  - **0b0** MRS reads of TRBTRG_EL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRBSR_EL1, bit [55]**

*When FEAT_TRBE is implemented:*

- Trap MRS reads of TRBSR_EL1 at EL1 using AArch64 to EL2.
  - **0b0** MRS reads of TRBSR_EL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRBPTR_EL1, bit [54]**

*When FEAT_TRBE is implemented:*

- Trap MRS reads of TRBPTR_EL1 at EL1 using AArch64 to EL2.
  - **0b0** MRS reads of TRBPTR_EL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBMAR_EL1 at EL1 using AArch64 to EL2.

0\text{b}0 \ MRS reads of TRBMAR_EL1 are not trapped by this mechanism.

0\text{b}1 \ If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 to EL2.

0\text{b}0 \ MRS reads of TRBLIMITR_EL1 are not trapped by this mechanism.

0\text{b}1 \ If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBIDR_EL1, bit [51]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBIDR_EL1 at EL1 using AArch64 to EL2.

0\text{b}0 \ MRS reads of TRBIDR_EL1 are not trapped by this mechanism.

0\text{b}1 \ If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBBASER_EL1, bit [50]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBBASER_EL1 at EL1 using AArch64 to EL2.

0\text{b}0 \ MRS reads of TRBBASER_EL1 are not trapped by this mechanism.

0\text{b}1 \ If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [49]**

Reserved, RES0.

**TRCVICTLR, bit [48]**

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to
the trace unit registers is implemented):*

In an Armv9 implementation, trap MRS reads of TRCVICTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCVICTLR at EL1 using AArch64 to EL2.

0b0: MRS reads of TRCVICTLR are not trapped by this mechanism.

0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCSTATR, bit [47]**

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to
the trace unit registers is implemented):*

In an Armv9 implementation, trap MRS reads of TRCSTATR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSTATR at EL1 using AArch64 to EL2.

0b0: MRS reads of TRCSTATR are not trapped by this mechanism.

0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSTATR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCSSCSRn, bit [46]**

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are
implemented and System register access to the trace unit registers is implemented):*

In an Armv9 implementation, trap MRS reads of TRCSSCSR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

0b0: MRS reads of TRCSSCSR<n> are not trapped by this mechanism.

0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implemented, a read of TRCSSCSR<n> is UNDEFINED.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSEQSTR at EL1 using AArch64 to EL2.
In an Armv8 implementation, trap MRS reads of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

0b0 MRS reads of TRCSEQSTR are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCPRGCTLR at EL1 using AArch64 to EL2.
In an Armv8 implementation, trap MRS reads of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

0b0 MRS reads of TRCPRGCTLR are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRCOSLSR, bit [43]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCOSLSR at EL1 using AArch64 to EL2.
In an Armv8 implementation, trap MRS reads of ETM TRCOSLSR at EL1 using AArch64 to EL2.

0b0 MRS reads of TRCOSLSR are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCOSLSR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.
Bit [42]
Reserved, RES0.

TRCIMSPEC<n>, bit [41]

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):*

In an Armv9 implementation, trap \texttt{MRS} reads of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap \texttt{MRS} reads of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

\[\begin{align*}
\texttt{0b0} & \quad \text{\texttt{MRS} reads of TRCIMSPEC<n> are not trapped by this mechanism.} \\
\texttt{0b1} & \quad \text{If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then \texttt{MRS} reads of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.}
\end{align*}\]

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a read of TRCIMSPEC<n> is \texttt{UNDEFINED}.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

TRCID, bit [40]

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):*

Trap \texttt{MRS} reads of multiple System registers. Enables a trap on \texttt{MRS} reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCDEVARCH.
  - TRCDEVVID.
  - All of the TRCIDR<n> registers.
- In an Armv8 implementation:
  - ETM TRCDEVARCH.
  - ETM TRCDEVVID.
  - All of the ETM TRCIDR<n> registers.

\[\begin{align*}
\texttt{0b0} & \quad \text{\texttt{MRS} reads of the System registers listed above are not trapped by this mechanism.} \\
\texttt{0b1} & \quad \text{If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then \texttt{MRS} reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.}
\end{align*}\]

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

Bits [39:38]
Reserved, RES0.
TRCCNTVR<\text{n}>, bit [37]

When \text{FEAT\_ETE} is implemented or (\text{FEAT\_ETMv4} is implemented, \text{TRCCNTVR}<n> are implemented and System register access to the trace unit registers is implemented):

- In an Armv9 implementation, trap \texttt{MRS} reads of TRCCNTVR<n> at EL1 using AArch64 to EL2.
- In an Armv8 implementation, trap \texttt{MRS} reads of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.
  
\begin{tabular}{ll}
\hline
0b0 & \texttt{MRS} reads of TRCCNTVR<n> are not trapped by this mechanism. \\
0b1 & If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR\_EL3.FGTEn == 1, then \texttt{MRS} reads of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
\end{tabular}

If Counter \text{n} is not implemented, a read of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\textbf{Otherwise:}

Reserved, RES0.

TRCCLAIM, bit [36]

When \text{FEAT\_ETE} is implemented or (\text{FEAT\_ETMv4} is implemented and System register access to the trace unit registers is implemented):

- In an Armv9 implementation, trap \texttt{MRS} reads of TRCCLAIMCLR and TRCCLAIMSET at EL1 using AArch64 to EL2.
- In an Armv8 implementation, trap \texttt{MRS} reads of ETM TRCCLAIMCLR and ETM TRCCLAIMSET at EL1 using AArch64 to EL2.

\begin{tabular}{ll}
\hline
0b0 & \texttt{MRS} reads of the System registers listed above are not trapped by this mechanism. \\
0b1 & If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR\_EL3.FGTEn == 1, then \texttt{MRS} reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
\end{tabular}

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\textbf{Otherwise:}

Reserved, RES0.

TRCAUXCTLR, bit [35]

When \text{FEAT\_ETE} is implemented or (\text{FEAT\_ETMv4} is implemented and System register access to the trace unit registers is implemented):

- In an Armv9 implementation, trap \texttt{MRS} reads of TRCAUXCTLR at EL1 using AArch64 to EL2.
- In an Armv8 implementation, trap \texttt{MRS} reads of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

\begin{tabular}{ll}
\hline
0b0 & \texttt{MRS} reads of TRCAUXCTLR are not trapped by this mechanism. \\
0b1 & If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR\_EL3.FGTEn == 1, then \texttt{MRS} reads of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
\end{tabular}

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\textbf{Otherwise:}

Reserved, RES0.
TRCAUTHSTATUS, bit [34]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCAUTHSTATUS at EL1 using AArch64 to EL2.

0b0 MRS reads of TRCAUTHSTATUS are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUTHSTATUS at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRC, bit [33]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of the following registers at EL1 using AArch64 to EL2:

- TRCACATR<n>.
- TRCACVR<n>.
- TRCBBCCTRLR.
- TRCCCCCTRLR.
- TRCCIDCCTRLR0.
- TRCCIDCCTRLR1.
- TRCCIDCVR<n>.
- TRCCNCTCTRL<n>.
- TRCCNTRLDVR<n>.
- TRCCONFIGR.
- TRCEVENTCTRL0R.
- TRCEVENTCTRL1R.
- TRCEXINSEL<n>.
- TRCQCTLR.
- TRCRSCTLR<n>.
- TRCRSR.
- TRCSEQEVR<n>.
- TRCSEQRSTEVXR.
- TRCSSCCCR<n>.
- TRCSSPCICR<n>.
- TRCSTALLCTRLR.
- TRCSYNCPR.
- TRCTRACEEDR.
- TRCTSCCTRLR.
- TRCVIIECTLR.
- TRCVIPCSSCTLR.
- TRCVISSCTLR.
In an Armv8 implementation, trap \texttt{MRS} reads of the following registers at EL1 using AArch64 to EL2:

- ETM TRCACATR<n>.
- ETM TRCACVR<n>.
- ETM TRCBBCTLR.
- ETM TRCCCTLR.
- ETM TRCCIDCCTL0.
- ETM TRCCIDCCTL1.
- ETM TRCCIDCVR<n>.
- ETM TRCCNTCTLR<n>.
- ETM TRCCNTRLDVR<n>.
- ETM TRCCONFIGR.
- ETM TRCEVENTCTL0R.
- ETM TRCEVENTCTL1R.
- ETM TRCEXINSELR.
- ETM TRCQCCTLR.
- ETM TRCRSCTLR<n>.
- ETM TRCSEQEVR<n>.
- ETM TRCSEQRSTEV.<
- ETM TRCSSC<n>.
- ETM TRCSSPCICR<n>.
- ETM TRCSTALLCTLR.
- ETM TRCSYNCR.
- ETM TRCTRACEIDR.
- ETM TRCTSTCTRL.
- ETM TRCVIIECTLR.
- ETM TRCVIPCSSCTLR.
- ETM TRCVISSCTLR.
- ETM TRCMIDCCTL0.
- ETM TRCMIDCCTL1.
- ETM TRCMIDCVR<n>.

\texttt{MRS} reads of the System registers listed above are not trapped by this mechanism.

If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then \texttt{MRS} reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

\texttt{TRCEXINSELR<n> and TRCRSR} are only implemented if FEAT_ETE is implemented.

\texttt{TRCEXINSELR} is only implemented if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
Otherwise:
Reserved, RES0.

PMSLATFR_EL1, bit [32]

When FEAT_SPE is implemented:
Trap MSR reads of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR reads of PMSLATFR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:
Trap MSR reads of PMSIRR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR reads of PMSIRR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMSIDR_EL1, bit [30]

When FEAT_SPE is implemented:
Trap MSR reads of PMSIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR reads of PMSIDR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads of PMSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMSICR_EL1, bit [29]

When FEAT_SPE is implemented:
Trap MSR reads of PMSICR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR reads of PMSICR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

PMSFCR_EL1, bit [28]

When FEAT_SPE is implemented:

- Trap MR5 reads of PMSFCR_EL1 at EL1 using AArch64 to EL2.
  - 0b0: MR5 reads of PMSFCR_EL1 are not trapped by this mechanism.
  - 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MR5 reads of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When FEAT_SPE is implemented:

- Trap MR5 reads of PMSEVFR_EL1 at EL1 using AArch64 to EL2.
  - 0b0: MR5 reads of PMSEVFR_EL1 are not trapped by this mechanism.
  - 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MR5 reads of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

- Trap MR5 reads of PMSCR_EL1 at EL1 using AArch64 to EL2.
  - 0b0: MR5 reads of PMSCR_EL1 are not trapped by this mechanism.
  - 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MR5 reads of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

- Trap MR5 reads of PMBSR_EL1 at EL1 using AArch64 to EL2.
  - 0b0: MR5 reads of PMBSR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMBPTR_EL1, bit [24]

When FEAT_SPE is implemented:
- Trap MRS reads of PMBPTR_EL1 at EL1 using AArch64 to EL2.
  0b0 MRS reads of PMBPTR_EL1 are not trapped by this mechanism.
  0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMBLIMITR_EL1, bit [23]

When FEAT_SPE is implemented:
- Trap MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.
  0b0 MRS reads of PMBLIMITR_EL1 are not trapped by this mechanism.
  0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMMIR_EL1, bit [22]

When FEAT_PMUv3 is implemented:
- Trap MRS reads of PMMIR_EL1 at EL1 using AArch64 to EL2.
  0b0 MRS reads of PMMIR_EL1 are not trapped by this mechanism.
  0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMMIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

Bits [21:20]

Reserved, RES0.
**PMSEL_EL0, bit [19]**

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMSEL_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSEL at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MRS reads of PMSEL_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSEL at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.[E2H, TGE] != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

- MRS reads of PMSEL_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MRC reads of PMSEL at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMOVNS, bit [18]**

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMOVSCLR_EL0 and PMOVSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMOVSR and PMOVSET.

0b0  The operations listed above are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.[E2H, TGE] != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

- MRS reads at EL1 and EL0 using AArch64 of PMOVSCLR_EL0 and PMOVSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
- MRC reads at EL0 using AArch32 of PMOVSR and PMOVSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PINTEN, bit [17]**

When FEAT_PMUv3 is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

0b0  MRS reads of the System registers listed above are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMCNTEN, bit [16]

When FEAT_PMUv3 is implemented:

Traps MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:
• At EL1 and EL0 using AArch64: MRS reads of PMCNTECLKR_EL0 and PMCNTESET_EL0.
• At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMCNTECLKR and PMCNTESET.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Traps MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0 MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:
• MRS reads at EL1 and EL0 using AArch64 of PMCNTECLKR_EL0 and PMCNTESET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
• MRC reads at EL0 using AArch32 of PMCNTECLKR and PMCNTESET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.
PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Traps MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current security state, HCR_EL2.{E2H, TGE} != \{1, 1\}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

- MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MRC reads of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR_EL0 can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Traps MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVTYPEP<P>EVTYPER_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMEVTYPEP<P>EVTYPER and PMXEVTYPER.

0b0  The operations listed above are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current security state, HCR_EL2.{E2H, TGE} != \{1, 1\}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

- MRS reads at EL1 and EL0 using AArch64 of PMEVTYPEP<P>EVTYPER_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
- MRC reads at EL0 using AArch32 of PMEVTYPEP<P>EVTYPER and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVTYPEP<P>EVTYPER_EL0, or, if n is not 31, a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVTYPEP<P>EVTYPER, or, if n is not 31, a read of PMXEVTYPER when PMSELR.SEL == n.
• If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  — In AArch64 state, a read of PMEVTYPER<\(n\)>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == \(n\), reported with EC syndrome value 0x18.
  — In AArch32 state, a read of PMEVTYPER<\(n\)> , or a read of PMXEVTYPER when PMSELR.SEL == \(n\), reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**PMEVCNTRn_EL0, bit [12]**

_When FEAT_PMUv3 is implemented:_

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

• At EL1 and EL0 using AArch64: MRS reads of PMEVCNTR<\(n\)>_EL0 and PMXEVCNTR_EL0.

• At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMEVCNTR<\(n\)> and PMXEVCNTR.

0b0
The operations listed above are not trapped by this mechanism.

0b1
If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != \{1, 1\}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:

• MRS reads at EL1 and EL0 using AArch64 of PMEVCNTR<\(n\)>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.

• MRC reads at EL0 using AArch32 of PMEVCNTR<\(n\)> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value \(n\):

• If event counter n is not implemented, the following accesses are UNDEFINED:
  — In AArch64 state, a read of PMEVCNTR<\(n\)>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == \(n\).
  — In AArch32 state, a read of PMEVCNTR<\(n\)> , or a read of PMXEVCNTR when PMSELR.SEL == \(n\).

• If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  — In AArch64 state, a read of PMEVCNTR<\(n\)>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == \(n\), reported with EC syndrome value 0x18.
  — In AArch32 state, a read of PMEVCNTR<\(n\)> , or a read of PMXEVCNTR when PMSELR.SEL == \(n\), reported with EC syndrome value 0x03.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.
OSDLR_EL1, bit [11]

When FEAT_DoubleLock is implemented:

Trap MRS reads of OSDLR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of OSDLR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MRS reads of OSECCR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of OSECCR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

OSLSR_EL1, bit [9]

Trap MRS reads of OSLSR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of OSLSR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSLSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [8]

Reserved, RES0.

DBGPRCR_EL1, bit [7]

Trap MRS reads of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of DBGPRCR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of DBGAUTHSTATUS_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGCLAIM, bit [5]**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

0b0 MRS reads of the System registers listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MDSCR_EL1, bit [4]**

Trap MRS reads of MDSCR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of MDSCR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGWVRn_EL1, bit [3]**

Trap MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of DBGWVR<n>_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGWCRn_EL1, bit [2]**

Trap MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of DBGWCR<n>_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
DBGBVR<sub>n</sub>_EL1, bit [1]  
Trap MRS reads of DBGBVR<sub>n</sub>_EL1 at EL1 using AArch64 to EL2.

- 0b0 MRS reads of DBGBVR<sub>n</sub>_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBVR<sub>n</sub>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBVR<sub>n</sub>_EL1 is undefined.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBCR<sub>n</sub>_EL1, bit [0]  
Trap MRS reads of DBGBCR<sub>n</sub>_EL1 at EL1 using AArch64 to EL2.

- 0b0 MRS reads of DBGBCR<sub>n</sub>_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBCR<sub>n</sub>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBCR<sub>n</sub>_EL1 is undefined.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HDFGRTR_EL2

D17.2.51 HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

**Configurations**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

**Attributes**

HDFGWTR_EL2 is a 64-bit register.

**Field descriptions**

Bit [63]

Reserved, RES0.
**nPMSNEVFR_EL1, bit [62]**

*When FEAT_SPEv1p2 is implemented:*

Trap MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

0b1  MSR writes of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**nBRBDATA, bit [61]**

*When FEAT_BRBE is implemented:*

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBINFINJ_EL1.
- BRBSRCINJ_EL1.
- BRBTGTINJ_EL1.
- BRBTS_EL1.

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

0b1  MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**nBRBCTL, bit [60]**

*When FEAT_BRBE is implemented:*

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBCR_EL1.
- BRBFRCR_EL1.

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

0b1  MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bits [59:58]**

Reserved, RES0.
PMUSERENR_EL0, bit [57]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMUSERENR_EL0 at EL1 using AArch64 to EL2.

0b0 MSR writes of PMUSERENR_EL0 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMUSERENR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBTRG_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRBTRG_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBSR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRBSR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBPTR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRBPTR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
TRBMAR_EL1, bit [53]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBMAR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRBMAR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRBLIMITR_EL1, bit [52]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [51]

Reserved, RES0.

TRBBASER_EL1, bit [50]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBBASER_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRBBASER_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRFCR_EL1, bit [49]

When FEAT_TRF is implemented:

Trap MSR writes of TRFCR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of TRFCR_EL1 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCVICTLR, bit [48]**

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCVICTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCVICTLR at EL1 using AArch64 to EL2.

0b0 MSR writes of TRCVICTLR are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [47]**

Reserved, RES0.

**TRCSSCSR<n>, bit [46]**

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCSSCSR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

0b0 MSR writes of TRCSSCSR<n> are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implemented, a write of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCSEQSTR, bit [45]**

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCSEQSTR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

0b0 MSR writes of TRCSEQSTR are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCPRGCTLR at EL1 using AArch64 to EL2.
In an Armv8 implementation, trap MSR writes of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

0b0  MSR writes of TRCPRGCTLR are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [43]
Reserved, RES0.

TRCOSLAR, bit [42]

When System register access to the trace unit registers is implemented and FEAT_ETMv4 is implemented:

In an Armv8 implementation, trap MSR writes of ETM TRCOSLAR at EL1 using AArch64 to EL2.

0b0  MSR writes of TRCOSLAR are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCIMSPEC<n> at EL1 using AArch64 to EL2.
In an Armv8 implementation, trap MSR writes of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

0b0  MSR writes of TRCIMSPEC<n> are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a write of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [40:38]**

Reserved, RES0.

**TRCCNTVRn, bit [37]**

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the trace unit registers is implemented):*

In an Armv9 implementation, trap MSR writes of TRCCNTVR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

- 0b0 MSR writes of TRCCNTVR<n> are not trapped by this mechanism.

- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

If Counter n is not implemented, a write of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCCLAIM, bit [36]**

*When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):*

In an Armv9 implementation, trap MSR writes of TRCCLAIMCLR and TRCCLAIMSET at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCCLAIMCLR and ETM TRCCLAIMSET at EL1 using AArch64 to EL2.

- 0b0 MSR writes of the System registers listed above are not trapped by this mechanism.

- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
TRCAUXCTLR, bit [35]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCAUXCTLR at EL1 using AArch64 to EL2.
In an Armv8 implementation, trap MSR writes of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

0b0  MSR writes of TRCAUXCTLR are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [34]
Reserved, RES0.

TRC, bit [33]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of the following registers at EL1 using AArch64 to EL2:

- TRCACATR<\(n\)>.
- TRCACVR<\(n\)>.
- TRCBBCCTRL.
- TRCCCTCTRL.
- TRCCIDCCTLR0.
- TRCCIDCCTLR1.
- TRCCIDCVR<\(n\)>.
- TRCCNTCTLR<\(n\)>.
- TRCCNTRLDVR<\(n\)>.
- TRCCONFIGR.
- TRCEVENTCTLR0R.
- TRCEVENTCTLR1R.
- TRCEXINTSELR<\(n\)>.
- TRCQCTRL.
- TRCRSCTRL<\(n\)>.
- TRCRSR.
- TRCSEQEVR<\(n\)>.
- TRCSEQRSRTEVR.
- TRCSSCCR<\(n\)>.
- TRCSSPCICR<\(n\)>.
- TRCSALLCTLR.
- TRCSYNCPR.
- TRCTRACEIDR.
• TRCTSCTLR.
• TRCVIIECTLR.
• TRCVIPCSSCTLR.
• TRCVISSCTLR.
• TRCVMIDCCTL0.
• TRCVMIDCCTL1.
• TRCVMIDCVR<n>.

In an Armv8 implementation, trap MSR writes of the following registers at EL1 using AArch64 to EL2:

• ETM TRCACATR<n>.
• ETM TRCACVR<n>.
• ETM TRCBBCTRL.
• ETM TRCCCCTL.
• ETM TRCCIDDCTL0.
• ETM TRCCIDDCTL1.
• ETM TRCCIDCVR<n>.
• ETM TRCCNTCTL<n>.
• ETM TRCCNTLDVR<n>.
• ETM TRCCONFIGR.
• ETM TRCEVENTCTL0R.
• ETM TRCEVENTCTL1R.
• ETM TRCEXTINSELR.
• ETM TRCQCTRL.
• ETM TRCRSCTL<n>.
• ETM TCSEQEVR<n>.
• ETM TRCSEQSTEV.<n>.
• ETM TRCSSCVR<n>.
• ETM TRCSSPCICR<n>.
• ETM TRCSSPCICR<n>.
• ETM TRCTALLCTL.<n>.
• ETM TRCSYNCPR.
• ETM TRCTRACEIDR.
• ETM TRCTSCTL.<n>.
• ETM TRCVIIECTL.<n>.
• ETM TRCVIPCSSCTL.<n>.
• ETM TRCVISSCTL.<n>.
• ETM TRCVMIDCCTL0.<n>.
• ETM TRCVMIDCCTL1.<n>.
• ETM TRCVMIDCVR<n>.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

TRCEXTINSELR<n> and TRCRSR are only implemented if FEAT_ETE is implemented.
TRCEXTINSELR is only implemented if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMSLATFR_EL1, bit [32]
When FEAT_SPE is implemented:
Traps MSR writes of PMSLATFR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MSR writes of PMSLATFR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMSIRR_EL1, bit [31]
When FEAT_SPE is implemented:
Traps MSR writes of PMSIRR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MSR writes of PMSIRR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [30]
Reserved, RES0.

PMSICR_EL1, bit [29]
When FEAT_SPE is implemented:
Traps MSR writes of PMSICR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MSR writes of PMSICR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.
PMSFCR_EL1, bit [28]

When FEAT_SPE is implemented:

Trap MSR writes of PMSFCR_EL1 at EL1 using AArch64 to EL2.

- **0b0** MSR writes of PMSFCR_EL1 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When FEAT_SPE is implemented:

Trap MSR writes of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

- **0b0** MSR writes of PMSEVFR_EL1 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

Trap MSR writes of PMSCR_EL1 at EL1 using AArch64 to EL2.

- **0b0** MSR writes of PMSCR_EL1 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

Trap MSR writes of PMBSR_EL1 at EL1 using AArch64 to EL2.

- **0b0** MSR writes of PMBSR_EL1 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
**PMBPTR_EL1, bit [24]**

*When FEAT_SPE is implemented:*

Trap MSR writes of `PMBPTR_EL1` at EL1 using AArch64 to EL2.

- **0b0** MSR writes of `PMBPTR_EL1` are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then MSR writes of `PMBPTR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Reserved, RES0.**

**PMBLIMITR_EL1, bit [23]**

*When FEAT_SPE is implemented:*

Trap MSR writes of `PMBLIMITR_EL1` at EL1 using AArch64 to EL2.

- **0b0** MSR writes of `PMBLIMITR_EL1` are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then MSR writes of `PMBLIMITR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Reserved, RES0.**

**Bit [22]**

Reserved, RES0.

**PMCR_EL0, bit [21]**

*When FEAT_PMUv3 is implemented:*

Trap MSR writes of `PMCR_EL0` at EL1 and EL0 using AArch64 and MCR writes of `PMCR` at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** MSR writes of `PMCR_EL0` at EL1 and EL0 using AArch64 and MCR writes of `PMCR` at EL0 using AArch32 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, `HCR_EL2.{E2H, TGE} != {1, 1}`, EL1 is using AArch64, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then, unless the write generates a higher priority exception:
  - MSR writes of `PMCR_EL0` at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`.
  - MCR writes of `PMCR` at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value `0x03`.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Reserved, RES0.**
PMSWINC_EL0, bit [20]

When FEAT_PMUv3 is implemented:
Trap MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:
   •  MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
   •  MCR writes of PMSWINC at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
•  On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMSELR_EL0, bit [19]

When FEAT_PMUv3 is implemented:
Trap MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:
   •  MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
   •  MCR writes of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
•  On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMOVS, bit [18]

When FEAT_PMUv3 is implemented:
Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:
•  At EL1 and EL0 using AArch64: MSR writes of PMOVSCLR_EL0 and PMOVSSSET_EL0.
•  At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMOVSR and PMOVSSSET.

0b0  The operations listed above are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:
   •  MSR writes at EL1 and EL0 using AArch64 of PMOVSCLR_EL0 and PMOVSSSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
• MCR writes at EL0 using AArch32 of PMOVSR and PMOVSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMINTEN, bit [17]

When FEAT_PMUv3 is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

• PMINTENCL_EL1.
• PMINTENSET_EL1.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

PMCNTEN, bit [16]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

• At EL1 and EL0 using AArch64: MSR writes of PMCNTENCL_EL0 and PMCNTENSET_EL0.
• At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMCNTENCL and PMCNTENSET.

0b0 The operations listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:

• MSR writes at EL1 and EL0 using AArch64 of PMCNTENCL_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
• MCR writes at EL0 using AArch32 of PMCNTENCL and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.
PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} = {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:

- MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} = {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:

- MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MCR writes of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSEL R.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSEL R_EL0.SEL or PMSEL R.SEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMEVTYPER<n> and PMXEVTYPER.

0b0  The operations listed above are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:
   • MSR writes at EL1 and EL0 using AArch64 of PMEVTYPER<ν>_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
   • MCR writes at EL0 using AArch32 of PMEVTYPER<ν> and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value ν:
   • If event counter ν is not implemented, the following accesses are UNDEFINED:
     — In AArch64 state, a write of PMEVTYPER<ν>_EL0, or if ν is not 31, a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == ν.
     — In AArch32 state, a write of PMEVTYPER<ν>, or if ν is not 31, a write of PMXEVTYPER when PMSELR.SEL == ν.
   • If event counter ν is implemented, ν is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
     — In AArch64 state, a write of PMEVTYPER<ν>_EL0, or a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == ν, reported with EC syndrome value 0x18.
     — In AArch32 state, a write of PMEVTYPER<ν>, or a write of PMXEVTYPER when PMSELR.SEL == ν, reported with EC syndrome value 0x03.

See also HDFGWTR_EL2:PMCCFILTER_EL0.

The reset behavior of this field is:
   • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

 Otherwise:
   Reserved, RES0.

PMEVCNTRn_EL0, bit [12]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:
   • At EL1 and EL0 using AArch64: MSR writes of PMEVCNTR<ν>_EL0 and PMXEVCNTR_EL0.
   • At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMEVCNTR<ν> and PMXEVCNTR.

0b0  The operations listed above are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:
   • MSR writes at EL1 and EL0 using AArch64 of PMEVCNTR<ν>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
   • MCR writes at EL0 using AArch32 of PMEVCNTR<ν> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value ν:
   • If event counter ν is not implemented, the following accesses are UNDEFINED:
     — In AArch64 state, a write of PMEVCNTR<ν>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == ν.
— In AArch32 state, a write of PMEVCNTR<\(n\)> , or a write of PMXEV CNTR when PMSELR.SEL \(\equiv n\).

• If event counter \(n\) is implemented, \(n\) is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

— In AArch64 state, a write of PMEVCNTR<\(n\)> \_EL0, or a write of PMXEV CNTR\_EL0 when PMSELR\_EL0.SEL \(\equiv n\), reported with EC syndrome value \(0x18\).

— In AArch32 state, a write of PMEVCNTR<\(n\)> , or a write of PMXEV CNTR when PMSELR.SEL \(\equiv n\), reported with EC syndrome value \(0x03\).

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\(\text{OSDLR\_EL1, bit [11]}\)

When \(\text{FEAT\_DoubleLock \text{is implemented}}\):

Trap MSR writes of OSDLR\_EL1 at EL1 using AArch64 to EL2.

\(0b0\) MSR writes of OSDLR\_EL1 are not trapped by this mechanism.

\(0b1\) If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR\_EL3.FGTEn \(\equiv 1\), then MSR writes of OSDLR\_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\(\text{Otherwise:}\)

Reserved, RES0.

\(\text{OSECCR\_EL1, bit [10]}\)

Trap MSR writes of OSECCR\_EL1 at EL1 using AArch64 to EL2.

\(0b0\) MSR writes of OSECCR\_EL1 are not trapped by this mechanism.

\(0b1\) If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR\_EL3.FGTEn \(\equiv 1\), then MSR writes of OSECCR\_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\(\text{Bit [9]}\)

Reserved, RES0.

\(\text{OSLAR\_EL1, bit [8]}\)

Trap MSR writes of OSLAR\_EL1 at EL1 using AArch64 to EL2.

\(0b0\) MSR writes of OSLAR\_EL1 are not trapped by this mechanism.

\(0b1\) If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR\_EL3.FGTEn \(\equiv 1\), then MSR writes of OSLAR\_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value \(0x18\), unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
DBGPRCR_EL1, bit [7]

Trap MSR writes of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of DBGPRCR_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [6]

Reserved, RES0.

DBGCLAIM, bit [5]

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

• DBGCLAIMCLR_EL1.
• DBGCLAIMSET_EL1.

0b0  MSR writes of the System registers listed above are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MSR writes of MDSCR_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of MDSCR_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of DBGWCR<n>_EL1 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWCR<\text{n}>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWCR<\text{n}>_EL1 is UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGBVRn_EL1, bit [1]**

Trap MSR writes of DBGBVR<\text{n}>_EL1 at EL1 using AArch64 to EL2.

- 0b0: MSR writes of DBGBVR<\text{n}>_EL1 are not trapped by this mechanism.
- 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBVR<\text{n}>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBVR<\text{n}>_EL1 is UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGBCRn_EL1, bit [0]**

Trap MSR writes of DBGBCR<\text{n}>_EL1 at EL1 using AArch64 to EL2.

- 0b0: MSR writes of DBGBCR<\text{n}>_EL1 are not trapped by this mechanism.
- 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBCR<\text{n}>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBCR<\text{n}>_EL1 is UNDEFINED.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Accessing HDFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

**MRS <\text{Xt}>, HDFGWTR_EL2**

### D17.2.52 HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR_EL2 characteristics are:

**Purpose**

Provides instruction trap controls.

**Configurations**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

**Attributes**

HFGITR_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Field Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-57</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [63:57]**

Reserved, RES0.
nBRBIALL, bit [56]

*When FEAT_BRBE is implemented:*

Trap execution of `BRB IALL` at EL1 using AArch64 to EL2.

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then execution of `BRB IALL` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

0b1  Execution of `BRB IALL` is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

*Otherwise:*

Reserved, RES0.

nBRBINJ, bit [55]

*When FEAT_BRBE is implemented:*

Trap execution of `BRB INJ` at EL1 using AArch64 to EL2.

0b0  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then execution of `BRB INJ` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

0b1  Execution of `BRB INJ` is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

*Otherwise:*

Reserved, RES0.

DCCVAC, bit [54]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- `DC CVAC`.
- `DC CGVAC`, if `FEAT_MTE` is implemented.
- `DC CGDVAC`, if `FEAT_MTE` is implemented.

If the Point of Coherence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0  Execution of the instructions listed above is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, `HCR_EL2.{E2H, TGE} != \{1, 1\}`, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SVC_EL1, bit [53]

Trap execution of `SVC` at EL1 using AArch64 to EL2.

0b0  Execution of `SVC` is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then execution of `SVC` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.
The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**SVC_EL0, bit [52]**

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 is not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != \{1, 1\}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception:
  - Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15.
  - Execution of SVC at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x11.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ERET, bit [51]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- ERET.
- ERETAA, if FEAT_PAuth is implemented.
- ERETAB, if FEAT_PAuth is implemented.

- **0b0** Execution of the instructions listed above is not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, HCR_EL2.API == 0, and this field enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CPPRCTX, bit [50]**

*When FEAT_SPECRES is implemented:*

Trap execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** Execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 is not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != \{1, 1\}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception:
  - Execution of CPP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.
  - Execution of CPPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**DVPRCTX, bit [49]**

*When FEAT_SPECRES is implemented:*

Trap execution of `DVPRCTX` at EL1 and EL0 using AArch64 and execution of `DVPRCTX` at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** Execution of `DVPRCTX` at EL1 and EL0 using AArch64 and execution of `DVPRCTX` at EL0 using AArch32 is not trapped by this mechanism.

- **0b1** If EL2 is implemented and enabled in the current Security state, `HCR_EL2.{E2H, TGE} !={1, 1}`, EL1 is using AArch64, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then, unless the instruction generates a higher priority exception:
  - Execution of `DVPRCTX` at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.
  - Execution of `DVPRCTX` at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**CFPRCTX, bit [48]**

*When FEAT_SPECRES is implemented:*

Trap execution of `CFPRCTX` at EL1 and EL0 using AArch64 and execution of `CFPRCTX` at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** Execution of `CFPRCTX` at EL1 and EL0 using AArch64 and execution of `CFPRCTX` at EL0 using AArch32 is not trapped by this mechanism.

- **0b1** If EL2 is implemented and enabled in the current Security state, `HCR_EL2.{E2H, TGE} !={1, 1}`, EL1 is using AArch64, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then, unless the instruction generates a higher priority exception:
  - Execution of `CFPRCTX` at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.
  - Execution of `CFPRCTX` at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIV AALE1, bit [47]**

Trap execution of `TLBIV AALE1`, `TLBIV AALE1NXS` at EL1 using AArch64 to EL2.

If `FEAT_XS` is implemented and `HCRX_EL2.FGTnXS == 0`, this field also traps execution of `TLBIV AALE1NXS`.

- **0b0** Execution of `TLBIV AALE1`, `TLBIV AALE1NXS` is not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1, TLBI VALE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVALE1, bit [46]  
Trap execution of TLBI VALE1, TLBI VALE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI VALE1NXS.

0b0  Execution of TLBI VALE1, TLBI VALE1NXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1, TLBI VALE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAAE1, bit [45]  
Trap execution of TLBI VAAE1, TLBI VAAE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI VAAE1NXS.

0b0  Execution of TLBI VAAE1, TLBI VAAE1NXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1, TLBI VAAE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIASIDE1, bit [44]  
Trap execution of TLBI ASIDE1, TLBI ASIDE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI ASIDE1NXS.

0b0  Execution of TLBI ASIDE1, TLBI ASIDE1NXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1, TLBI ASIDE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLIBVAE1, bit [43]  
Trap execution of TLBI VAE1, TLBI VAE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI VAE1NXS.

0b0  Execution of TLBI VAE1, TLBI VAE1NXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1, TLBI VAE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVMALLE1, bit [42]**

Trap execution of TLBI VMALLE1, TLBI VMALLE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1NXS.

- 0b0: Execution of TLBI VMALLE1, TLBI VMALLE1NXS is not trapped by this mechanism.
- 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1, TLBI VMALLE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIRVAALE1, bit [41]**

*When FEAT_TLBIRANGE is implemented:*

Trap execution of TLBI RVAALE1, TLBI RVAALE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1NXS.

- 0b0: Execution of TLBI RVAALE1, TLBI RVAALE1NXS is not trapped by this mechanism.
- 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1, TLBI RVAALE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIRVALE1, bit [40]**

*When FEAT_TLBIRANGE is implemented:*

Trap execution of TLBI RVALE1, TLBI RVALE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1NXS.

- 0b0: Execution of TLBI RVALE1, TLBI RVALE1NXS is not trapped by this mechanism.
- 0b1: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1, TLBI RVALE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIRVAAE1, bit [39]**

*When FEAT_TLBIRANGE is implemented:*

Trap execution of TLBI RVAAE1, TLBI RVAAE1NXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1NXS.

- **0b0**: Execution of TLBI RVAAE1, TLBI RVAAE1NXS is not trapped by this mechanism.
- **0b1**: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1, TLBI RVAAE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAE1, bit [38]**

*When FEAT_TLBIRANGE is implemented:*

 Trap execution of TLBI RVAE1, TLBI RVAE1NXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1NXS.

- **0b0**: Execution of TLBI RVAE1, TLBI RVAE1NXS is not trapped by this mechanism.
- **0b1**: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1, TLBI RVAE1NXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAALE1IS, bit [37]**

*When FEAT_TLBIRANGE is implemented:*

 Trap execution of TLBI RVAALE1IS, TLBI RVAALE1ISNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1ISNXS.

- **0b0**: Execution of TLBI RVAALE1IS, TLBI RVAALE1ISNXS is not trapped by this mechanism.
- **0b1**: If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1IS, TLBI RVAALE1ISNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVALE1IS, bit [36]**

*When FEAT_TLBIRANGE is implemented:*

 Trap execution of TLBI RVALE1IS, TLBI RVALE1ISNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1ISNXS.

- **0b0**: Execution of TLBI RVALE1IS, TLBI RVALE1ISNXS is not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS, TLBI RVAE1ISNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TLBIRVAE1IS, bit [35]

When FEAT_TLBIRANGE is implemented:
Trap execution of TLBI RVAE1IS, TLBI RVAE1ISNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1ISNXS.

0b0 Execution of TLBI RVAE1IS, TLBI RVAE1ISNXS is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS, TLBI RVAE1ISNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TLBIRVAE1IS, bit [34]

When FEAT_TLBIRANGE is implemented:
Trap execution of TLBI RVAE1IS, TLBI RVAE1ISNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1ISNXS.

0b0 Execution of TLBI RVAE1IS, TLBI RVAE1ISNXS is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS, TLBI RVAE1ISNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TLBIVAALE1IS, bit [33]

Trap execution of TLBI VAALE1IS, TLBI VAALE1ISNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1ISNXS.

0b0 Execution of TLBI VAALE1IS, TLBI VAALE1ISNXS is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1IS, TLBI VAALE1ISNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVALE11S, bit [32]**

Trap execution of TLBLI VALE11S, TLBLI VALE11SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBLI VALE11SNXS.

0b0 Execution of TLBLI VALE11S, TLBLI VALE11SNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBLI VALE11S, TLBLI VALE11SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVAAE11S, bit [31]**

Trap execution of TLBLI VAAE11S, TLBLI VAAE11SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBLI VAAE11SNXS.

0b0 Execution of TLBLI VAAE11S, TLBLI VAAE11SNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBLI VAAE11S, TLBLI VAAE11SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIASIDE11S, bit [30]**

Trap execution of TLBLI ASIDE11S, TLBLI ASIDE11SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBLI ASIDE11SNXS.

0b0 Execution of TLBLI ASIDE11S, TLBLI ASIDE11SNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBLI ASIDE11S, TLBLI ASIDE11SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVAE11S, bit [29]**

Trap execution of TLBLI VAE11S, TLBLI VAE11SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBLI VAE11SNXS.

0b0 Execution of TLBLI VAE11S, TLBLI VAE11SNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBLI VAE11S, TLBLI VAE11SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
TLBIVMALLE11S, bit [28]

Trap execution of TLBI VMALLE11S, TLBI VMALLE11SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE11SNXS.

0b0  Execution of TLBI VMALLE11S, TLBI VMALLE11SNXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE11S, TLBI VMALLE11SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIRVALEE10S, bit [27]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVALEE10S, TLBI RVALEE10SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALEE10SNXS.

0b0  Execution of TLBI RVALEE10S, TLBI RVALEE10SNXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALEE10S, TLBI RVALEE10SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALEE10S, bit [26]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVALEE10S, TLBI RVALEE10SNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALEE10SNXS.

0b0  Execution of TLBI RVALEE10S, TLBI RVALEE10SNXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALEE10S, TLBI RVALEE10SNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAEE10S, bit [25]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAEE10S, TLBI RVAEE10SNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1OSNXS.

0b0  Execution of TLBI RVAE1OS, TLBI RVAE1OSNXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1OS, TLBI RVAE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**TLBIRVAE1OS, bit [24]**

*When FEAT_TLBIRANGE is implemented and FEAT_TLB1OS is implemented:*

Trap execution of TLBI RVAE1OS, TLBI RVAE1OSNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1OSNXS.

0b0  Execution of TLBI RVAE1OS, TLBI RVAE1OSNXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1OS, TLBI RVAE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**TLBIVAALE1OS, bit [23]**

*When FEAT_TLB1OS is implemented:*

Trap execution of TLBI VAALE1OS, TLBI VAALE1OSNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1OSNXS.

0b0  Execution of TLBI VAALE1OS, TLBI VAALE1OSNXS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1OS, TLBI VAALE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**TLBIVALE1OS, bit [22]**

*When FEAT_TLB1OS is implemented:*

Trap execution of TLBI VALE1OS, TLBI VALE1OSNXS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1OSNXS.

0b0  Execution of TLBI VALE1OS, TLBI VALE1OSNXS is not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS, TLBI VAE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TLBIVAE1OS, bit [21]

When FEAT_TLBVIOS is implemented:
Trap execution of TLBI VAE1OS, TLBI VAE1OSNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI VAE1OSNXS.

0b0 Execution of TLBI VAE1OS, TLBI VAE1OSNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS, TLBI VAE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TLBIASIDE1OS, bit [20]

When FEAT_TLBIOs is implemented:
Trap execution of TLBI ASIDE1OS, TLBI ASIDE1OSNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI ASIDE1OSNXS.

0b0 Execution of TLBI ASIDE1OS, TLBI ASIDE1OSNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1OS, TLBI ASIDE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

TLBIVAE1OS, bit [19]

When FEAT_TLBVIOS is implemented:
Trap execution of TLBI VAE1OS, TLBI VAE1OSNXS at EL1 using AArch64 to EL2.
If FEAT_XS is implemented and HCRX_EL2.FGTXS == 0, this field also traps execution of TLBI VAE1OSNXS.

0b0 Execution of TLBI VAE1OS, TLBI VAE1OSNXS is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS, TLBI VAE1OSNXS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**TLBIVMALLE1OS, bit [18]**

*When FEAT_TLB1OS is implemented:*

- Trap execution of `TLBI VMALE1OS, TLBI VMALE1OSNXS` at EL1 using AArch64 to EL2.

  If `FEAT_XS` is implemented and `HCRX_EL2.FGtNXS == 0`, this field also traps execution of `TLBI VMALE1OSNXS`.

  - **0b0** Execution of `TLBI VMALE1OS, TLBI VMALE1OSNXS` is not trapped by this mechanism.
  
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGtEn == 1`, then execution of `TLBI VMALE1OS, TLBI VMALE1OSNXS` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

  The reset behavior of this field is:

  - On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**ATS1E1WP, bit [17]**

*When FEAT_PAN2 is implemented:*

- Trap execution of `ATS1E1WP` at EL1 using AArch64 to EL2.

  - **0b0** Execution of `ATS1E1WP` is not trapped by this mechanism.
  
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGtEn == 1`, then execution of `ATS1E1WP` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

  The reset behavior of this field is:

  - On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**ATS1E1RP, bit [16]**

*When FEAT_PAN2 is implemented:*

- Trap execution of `ATS1E1RP` at EL1 using AArch64 to EL2.

  - **0b0** Execution of `ATS1E1RP` is not trapped by this mechanism.
  
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGtEn == 1`, then execution of `ATS1E1RP` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

  The reset behavior of this field is:

  - On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**ATS1E0W, bit [15]**

- Trap execution of `ATS1E0W` at EL1 using AArch64 to EL2.

  - **0b0** Execution of `ATS1E0W` is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn` == 1, then execution of `AT S1E0W` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E0R, bit [14]**

Trap execution of `AT S1E0R` at EL1 using AArch64 to EL2.

0b0 Execution of `AT S1E0R` is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn` == 1, then execution of `AT S1E0R` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E1W, bit [13]**

Trap execution of `AT S1E1W` at EL1 using AArch64 to EL2.

0b0 Execution of `AT S1E1W` is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn` == 1, then execution of `AT S1E1W` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E1R, bit [12]**

Trap execution of `AT S1E1R` at EL1 using AArch64 to EL2.

0b0 Execution of `AT S1E1R` is not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn` == 1, then execution of `AT S1E1R` at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCZVA, bit [11]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:
- DC ZVA.
- DC GVA, if `FEAT_MTE` is implemented.
- DC GZVA, if `FEAT_MTE` is implemented.

Note
Unlike `HCR_EL2.TDZ`, this field has no effect on `DCZID_EL0.DZP`.

0b0 Execution of the instructions listed above is not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCIVAC, bit [10]**
Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:
- DC CIVAC.
- DC CIGVAC, if FEAT_MTE is implemented.
- DC CIGDVAC, if FEAT_MTE is implemented.

If the Point of Coherence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

Execution of the instructions listed above is not trapped by this mechanism.

**DCCVADP, bit [9]**
*When FEAT_DPB2 is implemented:*
Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:
- DC CVADP.
- DC CGVADP, if FEAT_MTE is implemented.
- DC CGDVADP, if FEAT_MTE is implemented.

If the Point of Deep Persistence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

Execution of the instructions listed above is not trapped by this mechanism.

**DCCVAP, bit [8]**
Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:
- DC CVAP.
- DC CGVAP, if FEAT_MTE is implemented.
• DC CGDVAP, if FEAT_MTE is implemented.

If the Point of Persistence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0  Execution of the instructions listed above is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCVAU, bit [7]

Trap execution of DC CV AU at EL1 and EL0 using AArch64 to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0  Execution of DC CV AU is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of DC CV AU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCISW, bit [6]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:
• DC CISW.
• DC CIGSW, if FEAT_MTE is implemented.
• DC CIGDSW, if FEAT_MTE is implemented.

0b0  Execution of the instructions listed above is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCSW, bit [5]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:
• DC CSW.
• DC CGSW, if FEAT_MTE is implemented.
• DC CGDSW, if FEAT_MTE is implemented.

0b0  Execution of the instructions listed above is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCISW, bit [4]
Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:
- DC ISW.
- DC IGSW, if FEAT_MTE is implemented.
- DC IGDSW, if FEAT_MTE is implemented.

0b0 Execution of the instructions listed above is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn \(\neq 1\), then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCIVAC, bit [3]
Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:
- DC IVAC.
- DC IGVAC, if FEAT_MTE is implemented.
- DC IGDVAC, if FEAT_MTE is implemented.

If the Point of Coherence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0 Execution of the instructions listed above is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn \(\neq 1\), then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIVAU, bit [2]
Trap execution of IC IVAU at EL1 and EL0 using AArch64 to EL2.
If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0 Execution of IC IVAU is not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} \(\neq \{1, 1\}\), and either EL3 is not implemented or SCR_EL3.FGTEn \(\neq 1\), then execution of IC IVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIALLU, bit [1]
Trap execution of IC IALLU at EL1 using AArch64 to EL2.
If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0 Execution of IC IALLU is not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of IC IALLU at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIALLUIS, bit [0]

Trap execution of IC IALLUIS at EL1 using AArch64 to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

0b0  Execution of IC IALLUIS is not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of IC IALLUIS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGITR_EL2

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, HFGITR_EL2**

D17.2.53 HFGTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of \( \text{MRS} \) and \( \text{MRC} \) reads of System registers.

**Configurations**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGTR_EL2 are **UNDEFINED**.

**Attributes**

HFGTR_EL2 is a 64-bit register.

**Field descriptions**

HFGTR_EL2 is a 64-bit register with the following field descriptions:

**Bits [63:56]**

Reserved, RES0.

**nTPIDR2_EL0, bit [55]**

*When FEAT_SME is implemented:*

Trap \( \text{MRS} \) reads of TPIDR_EL0 at EL1 and EL0 using AArch64 to EL2.

- **0b0**
  
  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} \(!= \{1, 1\} \), and either EL3 is not implemented or SCR_EL3.FGTEn \(!= 1\) then \( \text{MRS} \) reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1  
MRS reads of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]

*When FEAT_SME is implemented:*

Trap MRS reads of SMPRI_EL1 at EL1 using AArch64 to EL2.

0b0  
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

0b1  
MRS reads of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]

*When FEAT_LS64_ACCDATA is implemented:*

Trap MRS reads of ACCDATA_EL1 at EL1 using AArch64 to EL2.

0b0  
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

0b1  
MRS reads of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]

*When FEAT_RAS is implemented:*

Trap MRS reads of ERXADDR_EL1 at EL1 using AArch64 to EL2.

0b0  
MRS reads of ERXADDR_EL1 are not trapped by this mechanism.

0b1  
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.
ERXPFGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

0b0 \[\text{\textcopyright}\] MRS reads of ERXPFGCDN_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

\* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCCTL_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of ERXPFGCCTL_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

\* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGF_EL1, bit [46]

When FEAT_RAS is implemented:

Trap MRS reads of ERXPFGF_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of ERXPFGF_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

\* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXMISCn_EL1, bit [45]

When FEAT_RAS is implemented:

Trap MRS reads of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of ERXMISC<n>_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

\* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
Otherwise:
   Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:
   Trap MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.
   0b0   MRS reads of ERXSTATUS_EL1 are not trapped by this mechanism.
   0b1   If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
   • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
   Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:
   Trap MRS reads of ERXCTLR_EL1 at EL1 using AArch64 to EL2.
   0b0   MRS reads of ERXCTLR_EL1 are not trapped by this mechanism.
   0b1   If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
   • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
   Reserved, RES0.

ERXFR_EL1, bit [42]

When FEAT_RAS is implemented:
   Trap MRS reads of ERXFR_EL1 at EL1 using AArch64 to EL2.
   0b0   MRS reads of ERXFR_EL1 are not trapped by this mechanism.
   0b1   If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
   • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
   Reserved, RES0.

ERRSELR_EL1, bit [41]

When FEAT_RAS is implemented:
   Trap MRS reads of ERRSELR_EL1 at EL1 using AArch64 to EL2.
   0b0   MRS reads of ERRSELR_EL1 are not trapped by this mechanism.
   0b1   If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERRIDR_EL1, bit [40]**

**When FEAT_RAS is implemented:**

- Trap MRS reads of ERRIDR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MRS reads of ERRIDR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ICC_IGRPENn_EL1, bit [39]**

**When FEAT_GICv3 is implemented:**

- Trap MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.
- 0b0 MRS reads of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**VBAR_EL1, bit [38]**

- Trap MRS reads of VBAR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MRS reads of VBAR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TTBR1_EL1, bit [37]**

- Trap MRS reads of TTBR1_EL1 at EL1 using AArch64 to EL2.
- 0b0 MRS reads of TTBR1_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
**TTBR0_EL1, bit [36]**

Trap MRS reads of TTBR0_EL1 at EL1 using AArch64 to EL2.

- **0b0** MRS reads of TTBR0_EL1 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDR_EL0, bit [35]**

Trap MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:
  - MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MRC reads of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDRRO_EL0, bit [34]**

Trap MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 when EL1 is using AArch64 to EL2.

- **0b0** MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:
  - MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MRC reads of TPIDRURO at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDR_EL1, bit [33]**

Trap MRS reads of TPIDR_EL1 at EL1 using AArch64 to EL2.

- **0b0** MRS reads of TPIDR_EL1 are not trapped by this mechanism.
- **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
TCR_EL1, bit [32]

Trap MRS reads of TCR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of TCR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_EL0, bit [31]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

0b0 MRS reads of SCXTNUM_EL0 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != \{1, 1\}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of SCXTNUM_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MRS reads of SCTLR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of SCTLR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

REVIDR_EL1, bit [28]

Trap MRS reads of REVIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of REVIDR_EL1 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then `MRS` reads of `REVIDR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**PAR_EL1, bit [27]**
Trap `MRS` reads of `PAR_EL1` at EL1 using AArch64 to EL2.
- 0b0 `MRS` reads of `PAR_EL1` are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then `MRS` reads of `PAR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MPIDR_EL1, bit [26]**
Trap `MRS` reads of `MPIDR_EL1` at EL1 using AArch64 to EL2.
- 0b0 `MRS` reads of `MPIDR_EL1` are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then `MRS` reads of `MPIDR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MIDR_EL1, bit [25]**
Trap `MRS` reads of `MIDR_EL1` at EL1 using AArch64 to EL2.
- 0b0 `MRS` reads of `MIDR_EL1` are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then `MRS` reads of `MIDR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MAIR_EL1, bit [24]**
Trap `MRS` reads of `MAIR_EL1` at EL1 using AArch64 to EL2.
- 0b0 `MRS` reads of `MAIR_EL1` are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or `SCR_EL3.FGTEn == 1`, then `MRS` reads of `MAIR_EL1` at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**LORSA_EL1, bit [23]**
*When FEAT_LOR is implemented:*
Trap `MRS` reads of `LORSA_EL1` at EL1 using AArch64 to EL2.
- 0b0 `MRS` reads of `LORSA_EL1` are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LORN_EL1, bit [22]**

_When FEAT_LOR is implemented:_

Trap MRS reads of LORN_EL1 at EL1 using AArch64 to EL2.

0b0  MRS reads of LORN_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LORID_EL1, bit [21]**

_When FEAT_LOR is implemented:_

Trap MRS reads of LORID_EL1 at EL1 using AArch64 to EL2.

0b0  MRS reads of LORID_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORID_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LOREA_EL1, bit [20]**

_When FEAT_LOR is implemented:_

Trap MRS reads of LOREA_EL1 at EL1 using AArch64 to EL2.

0b0  MRS reads of LOREA_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

* On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap $MRS$ reads of LORC_EL1 at EL1 using AArch64 to EL2.

0b0  $MRS$ reads of LORC_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then $MRS$ reads of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ISR_EL1, bit [18]

Trap $MRS$ reads of ISR_EL1 at EL1 using AArch64 to EL2.

0b0  $MRS$ reads of ISR_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then $MRS$ reads of ISR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

FAR_EL1, bit [17]

Trap $MRS$ reads of FAR_EL1 at EL1 using AArch64 to EL2.

0b0  $MRS$ reads of FAR_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then $MRS$ reads of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap $MRS$ reads of ESR_EL1 at EL1 using AArch64 to EL2.

0b0  $MRS$ reads of ESR_EL1 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then $MRS$ reads of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCZID_EL0, bit [15]

Trap $MRS$ reads of DCZID_EL0 at EL1 and EL0 using AArch64 to EL2.

0b0  $MRS$ reads of DCZID_EL0 are not trapped by this mechanism.
0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} !={1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then $MRS$ reads of DCZID_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CTR_EL0, bit [14]**

Trap MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 to EL2.

0b0 MRS reads of CTR_EL0 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CSSELR_EL1, bit [13]**

Trap MRS reads of CSSELR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of CSSELR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CPACR_EL1, bit [12]**

Trap MRS reads of CPACR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of CPACR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CONTEXTIDR_EL1, bit [11]**

Trap MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of CONTEXTIDR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CLIDR_EL1, bit [10]**

Trap MRS reads of CLIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of CLIDR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CLIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CCSIDR_EL1, bit [9]

Trap MRS reads of CCSIDR_EL1 at EL1 using AArch64 to EL2.
0b0 MRS reads of CCSIDR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CCSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

APIBKey, bit [8]

When FEAT_PAuth is implemented:
Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
• APIBKeyHi_EL1.
• APIBKeyLo_EL1.
0b0 MRS reads of the System registers listed above are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAuth is implemented:
Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
• APIAKeyHi_EL1.
• APIAKeyLo_EL1.
0b0 MRS reads of the System registers listed above are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAuth is implemented:
Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
• APGAKeyHi_EL1.
• APGAKeyLo_EL1.
  
 0b0  MSR reads of the System registers listed above are not trapped by this mechanism.
  0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

  The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

  Otherwise:
  Reserved, RES0.

APDBKey, bit [5]

When FEAT_PAuth is implemented:
  Trap MSR reads of multiple System registers. Enables a trap on MSR reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
  • APDBKeyHi_EL1.
  • APDBKeyLo_EL1.
  
 0b0  MSR reads of the System registers listed above are not trapped by this mechanism.
  0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

  The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

  Otherwise:
  Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:
  Trap MSR reads of multiple System registers. Enables a trap on MSR reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:
  • APDAKeyHi_EL1.
  • APDAKeyLo_EL1.
  
 0b0  MSR reads of the System registers listed above are not trapped by this mechanism.
  0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

  The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

  Otherwise:
  Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR reads of AMAIR_EL1 at EL1 using AArch64 to EL2.
  
 0b0  MSR reads of AMAIR_EL1 are not trapped by this mechanism.
  0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR reads of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AIDR_EL1, bit [2]**

Trap MRS reads of AIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of AIDR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AFSR1_EL1, bit [1]**

Trap MRS reads of AFSR1_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of AFSR1_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AFSR0_EL1, bit [0]**

Trap MRS reads of AFSR0_EL1 at EL1 using AArch64 to EL2.

0b0 MRS reads of AFSR0_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Accessing HFGRTR_EL2**

Accesses to this register use the following encodings in the System register encoding space:

```plaintext
MRS <Xt>, HFGRTR_EL2
```

D17.2.54 HFGWTR_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MSR and MCR writes of System registers.

**Configurations**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

**Attributes**

HFGWTR_EL2 is a 64-bit register.

**Field descriptions**

The HFGWTR_EL2 register is a 64-bit register with specific fields described in detail.

**Bits [63:56]**

Reserved, RES0.

**nTPIDR2_EL0, bit [55]**

*When FEAT_SME is implemented:*

Trap MSR writes of TPIRDR_EL0 at EL1 and EL0 using AArch64 to EL2.

- **0b0** If EL2 is implemented and enabled in the current Security state, HCR_EL2.E2H, TGE = 1, and either EL3 is not implemented or SCR_EL3.FGTEn = 1, then MSR writes of TPID2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

- **0b1** MSR writes of TPID2_EL0 are not trapped by this mechanism.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**nSMPRI_EL1, bit [54]**

When FEAT_SME is implemented:

- Trap MSR writes of SMPRI_EL1 at EL1 using AArch64 to EL2.

  - 0b0 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

  - 0b1 MSR writes of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Bits [53:51]**
Reserved, RES0.

**nACCDATA_EL1, bit [50]**

When FEAT_LS64_ACCDATA is implemented:

- Trap MSR writes of ACCDATA_EL1 at EL1 using AArch64 to EL2.

  - 0b0 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

  - 0b1 MSR writes of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**ERXADDR_EL1, bit [49]**

When FEAT_RAS is implemented:

- Trap MSR writes of ERXADDR_EL1 at EL1 using AArch64 to EL2.

  - 0b0 MSR writes of ERXADDR_EL1 are not trapped by this mechanism.

  - 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.
ERXPFGCDN_EL1, bit [48]

*When FEAT_RASv1p1 is implemented:*

- Trap MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

  - **0b0** MSR writes of ERXPFGCDN_EL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

*Otherwise:*

Reserved, RES0.

ERXPFGCTEL1, bit [47]

*When FEAT_RASv1p1 is implemented:*

- Trap MSR writes of ERXPFGCTEL1 at EL1 using AArch64 to EL2.

  - **0b0** MSR writes of ERXPFGCTEL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCTEL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

*Otherwise:*

Reserved, RES0.

Bit [46]

Reserved, RES0.

ERXMISCn_EL1, bit [45]

*When FEAT_RAS is implemented:*

- Trap MSR writes of ERXMISCn_EL1 at EL1 using AArch64 to EL2.

  - **0b0** MSR writes of ERXMISCn_EL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXMISCn_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

*Otherwise:*

Reserved, RES0.

ERXSTATUS_EL1, bit [44]

*When FEAT_RAS is implemented:*

- Trap MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

  - **0b0** MSR writes of ERXSTATUS_EL1 are not trapped by this mechanism.
  - **0b1** If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**ERXCTLR_EL1, bit [43]**

*When FEAT_RAS is implemented:*

- Trap MSR writes of ERXCTLR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MSR writes of ERXCTLR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**ERRSELR_EL1, bit [41]**

*When FEAT_RAS is implemented:*

- Trap MSR writes of ERRSELR_EL1 at EL1 using AArch64 to EL2.
- 0b0 MSR writes of ERRSELR_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Bit [40]**

Reserved, RES0.

**ICC_IGRPEN<n>_EL1, bit [39]**

*When FEAT_GICv3 is implemented:*

- Trap MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.
- 0b0 MSR writes of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
- 0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.
VBAR_EL1, bit [38]

Trap MSR writes of VBAR_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of VBAR_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MSR writes of TTBR1_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of TTBR1_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MSR writes of TTBR0_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of TTBR0_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL0, bit [35]

Trap MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

0b0  MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:
- MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
- MCR writes of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x3.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_EL0, bit [34]

Trap MSR writes of TPIDRRO_EL0 at EL1 using AArch64 to EL2.

0b0  MSR writes of TPIDRRO_EL0 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]
Trap MSR writes of TPIDR_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of TPIDR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]
Trap MSR writes of TCR_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of TCR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_EL0, bit [31]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:
Trap MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.
0b0 MSR writes of SCXTNUM_EL0 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

SCXTNUM_EL1, bit [30]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:
Trap MSR writes of SCXTNUM_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of SCXTNUM_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
Otherwise:
Reserved, RES0.

SCTLR_EL1, bit [29]
Trap MSR writes of SCTLR_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of SCTLR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [28]
Reserved, RES0.

PAR_EL1, bit [27]
Trap MSR writes of PAR_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of PAR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [26:25]
Reserved, RES0.

MAIR_EL1, bit [24]
Trap MSR writes of MAIR_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of MAIR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]

When FEAT_LOR is implemented:
Trap MSR writes of LORSA_EL1 at EL1 using AArch64 to EL2.
0b0 MSR writes of LORSA_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.
LORN_EL1, bit [22]

When FEAT_LOR is implemented:

- Trap MSR writes of LORN_EL1 at EL1 using AArch64 to EL2.
- 0b0  MSR writes of LORN_EL1 are not trapped by this mechanism.
- 0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

- Trap MSR writes of LOREA_EL1 at EL1 using AArch64 to EL2.
- 0b0  MSR writes of LOREA_EL1 are not trapped by this mechanism.
- 0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

- Trap MSR writes of LORC_EL1 at EL1 using AArch64 to EL2.
- 0b0  MSR writes of LORC_EL1 are not trapped by this mechanism.
- 0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

FAR_EL1, bit [17]

Trap MSR writes of FAR_EL1 at EL1 using AArch64 to EL2.

- 0b0  MSR writes of FAR_EL1 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]
Trap MSR writes of ESR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of ESR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [15:14]
Reserved, RES0.

CSSELR_EL1, bit [13]
Trap MSR writes of CSSELR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of CSSELR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]
Trap MSR writes of CPACR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of CPACR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]
Trap MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of CONTEXTIDR_EL1 are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [10:9]
Reserved, RES0.
APIBKey, bit [8]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.

0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.
APDBKey, bit [5]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

0b0 MSR writes of the System registers listed above are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR writes of AMAIR_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of AMAIR_EL1 are not trapped by this mechanism.
0b1 If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [2]

Reserved, RES0.

AFSR1_EL1, bit [1]

Trap MSR writes of AFSR1_EL1 at EL1 using AArch64 to EL2.

0b0 MSR writes of AFSR1_EL1 are not trapped by this mechanism.
If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AFSR0_EL1, bit [0]**

Trap MSR writes of AFSR0_EL1 at EL1 using AArch64 to EL2.

0b0  MSR writes of AFSR0_EL1 are not trapped by this mechanism.

0b1  If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Accessing HFGWTR_EL2**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, HFGWTR_EL2**

D17.2.55 HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

**Configurations**

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HPFAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.
- If FEAT_RME is implemented, a Granule Protection Check fault in the second stage of translation.

For all other exceptions taken to EL2, this register is **UNKNOWN**.

--- **Note**

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the Instruction Abort exception or Data Abort exception. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

**Attributes**

HPFAR_EL2 is a 64-bit register.

**Field descriptions**

![Diagram of HPFAR_EL2 field descriptions]

Execution at EL1 or EL0 makes HPFAR_EL2 become **UNKNOWN**.

**NS, bit [63]**

*When FEAT_SEL2 is implemented:*

Faulting IPA address space.

- 0b0 Faulting IPA is from the Secure IPA space.
- 0b1 Faulting IPA is from the Non-secure IPA space.

For Data Abort exceptions or Instruction Abort exceptions taken to Non-secure EL2:

- This field is **RES0**.
- The address is from the Non-secure IPA space.
If FEAT_RME is implemented, for Data Abort exceptions or Instruction Abort exceptions taken to Realm EL2:

- This field is RES0.
- The address is from the Realm IPA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [62:44]

Reserved, RES0.

FIPA, bits [43:4]

Reserved, RES0.

FIPA, bits [39:0]

For implementations with fewer than 52 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort.

Bits[(n-1):0] of the value are UNKNOWN, where $2^n$ is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FIPA encoding for when FEAT_LPA is not implemented**

Bits [39:36]

Reserved, RES0.

FIPA, bits [35:0]

Reserved, RES0.
Bits\((n-1):0\) of the value are UNKNOWN, where \(2^n\) is the current stage 2 translation granule size in bytes.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits \([3:0]\)**

Reserved, RES0.

**Accessing HPFAR_EL2**

Accesses to this register use the following encodings in the System register encoding space:

**\(MRS \langle Xt\rangle, HPFAR_EL2\)**

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b100 & 0b0110 & 0b0000 & 0b100 \\
\end{array}
\]

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
    elsif PSTATE.EL == EL2 then
        X[t, 64] = HPFAR_EL2;
    elsif PSTATE.EL == EL3 then
        X[t, 64] = HPFAR_EL2;

**MSR HPFAR_EL2, \(\langle Xt\rangle\)**

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b100 & 0b0110 & 0b0000 & 0b100 \\
\end{array}
\]

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
    elsif PSTATE.EL == EL2 then
        HPFAR_EL2 = X[t, 64];
    elsif PSTATE.EL == EL3 then
        HPFAR_EL2 = X[t, 64];
**D17.2.56  HSTR_EL2, Hypervisor System Trap Register**

The HSTR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

**Configurations**

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

HSTR_EL2 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:

```

**Bits [63:16, 14, 4]**

Reserved, RES0.

**T<n>, bit [n], for n = 15, 13 to 5, 3 to 0**

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

**0b0**

This control has no effect on EL0 or EL1 accesses to System registers.

**0b1**

System registers in the coproc == 0b1111 encoding space and CRn == <n> or CRn == <n> where T<n> is the name of this field, are trapped as follows:

- An EL1 MCR or MRC access is trapped to EL2.
- An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.
- An EL1 MCRR or MRRC access is trapped to EL2.
- An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.
It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED.

If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00.

--- Note ---

Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D17.2.58  ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1

The ID_AA64AFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about the IMPLEMENTATION DEFINED features of the
PE in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme
for fields in ID registers* on page D17-5551.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64AFR1_EL1 is a 64-bit register.

D17.2.59  ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

The external register EDDFR gives information from this register.

**Attributes**

ID_AA64DFR0_EL1 is a 64-bit register.

### MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

- **0b0000**: FEAT_MTPMU not implemented. 
  If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<\(n\)>_EL0.MT and PMEVTYPER<\(n\)>._MT are read/write or RES0.

- **0b0001**: FEAT_MTPMU and FEAT_PMUv3 implemented. 
  PMEVTYPER<\(n\)>_EL0.MT and PMEVTYPER<\(n\)>._MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<\(n\)>_EL0.MT and PMEVTYPER<\(n\)>._MT are 0.

- **0b1111**: FEAT_MTPMU not implemented. 
  If FEAT_PMUv3 is implemented, PMEVTYPER<\(n\)>_EL0.MT and PMEVTYPER<\(n\)>._MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

### TraceBuffer, bits [47:44]

Trace Buffer Extension. Defined values are:

- **0b0000**: Trace Buffer Extension not implemented.
- **0b0001**: Trace Buffer Extension implemented.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0001.

In any Armv9 implementation, if FEAT_ETE is implemented, the value 0b0000 is not permitted.

### TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

- **0b0000**: Armv8.4 Self-hosted Trace Extension not implemented.
- **0b0001**: Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture trace unit is implemented, the value 0b0000 is not permitted.

### DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

- **0b0000**: OS Double Lock implemented. OSDLR_EL1 is RW.
- **0b1111**: OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

### PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

- **0b0000**: Statistical Profiling Extension not implemented.
- **0b0001**: Statistical Profiling Extension implemented.
0b0010  As 0b0001, and adds:
- Support for the Event packet Alignment flag.
- If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.

0b0011  As 0b0010, and adds:
- Discard mode.
- Extended event filtering, including the PMSNVFR_EL1 System register.
- Support for the OPTIONAL previous branch target Address packet.
- If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs.
- If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events.

0b0100  As 0b0011, and adds:
- If FEAT_MOPS is implemented, Operation Type packet encodings for Memory Copy and Set operations.
- If FEAT_MTE is implemented, Operation Type packet encodings for loads and stores of Allocation Tags.

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.
FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.
FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.
FEAT_SPEv1p3 implements the functionality identified by the value 0b100.

From Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.
From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.
From Armv8.8, if FEAT_SPE is implemented, the value 0b0011 is not permitted.

CTX_CMPs, bits [31:28]
Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]
Reserved, RES0.

WRPs, bits [23:20]
Number of watchpoints, minus 1. The value of 0b0000 is reserved.

Bits [19:16]
Reserved, RES0.

BRPs, bits [15:12]
Number of breakpoints, minus 1. The value of 0b0000 is reserved.

PMUVer, bits [11:8]
Performance Monitors Extension version.
This field does not follow the standard ID scheme, but uses the alternative ID scheme described in Alternative ID scheme used for the Performance Monitors Extension version on page D17-5553

Defined values are:
0b0000  Performance Monitors Extension not implemented.
0b0001  Performance Monitors Extension, PMUv3 implemented.
PMUv3 for Armv8.1. As 0b0001, and adds support for:
- Extended 16-bit PMEVTYPEr<\alpha>_{EL0}.evtCount field.
- If EL2 is implemented, the MDCR_{EL2}.HPMD control.

0b0101 PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.

0b0110 PMUv3 for Armv8.5. As 0b0101, and adds support for:
- 64-bit event counters.
- If EL2 is implemented, the MDCR_{EL2}.HCCD control.
- If EL3 is implemented, the MDCR_{EL3}.SCCD control.

0b0111 PMUv3 for Armv8.7. As 0b0110, and adds support for:
- The PMCR_{EL0}.FZO and, if EL2 is implemented, MDCR_{EL2}.HPMFZO controls.
- If EL3 is implemented, the MDCR_{EL3}.\{MPMX,MCCD\} controls.

0b1000 PMUv3 for Armv8.8. As 0b0111, and:
- Extends the Common event number space to include 0x0040 to 0x08BF and 0x4040 to 0x40BF.
- Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.

0b1111 IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.
FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.
FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.
FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.
FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.
FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.
From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.
From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.
From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.
From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

TraceVer, bits [7:4]
Trace support. Indicates whether System register interface to a trace unit is implemented. Defined values are:
- 0b0000 Trace unit System registers not implemented.
- 0b0001 Trace unit System registers implemented.

All other values are reserved.

When trace unit System registers are implemented, see TRCIDR1 for tracing capabilities of the trace unit.

DebugVer, bits [3:0]
Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:
- 0b0110 Armv8 debug architecture.
- 0b0111 Armv8 debug architecture with Virtualization Host Extensions.
- 0b1000 Armv8.2 debug architecture, FEAT_Debugv8p2.
- 0b1001 Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010  Armv8.8 debug architecture, FEAT_Debugv8p8.

All other values are reserved.

FEAT_VHE adds the functionality identified by the value 0b0111.
FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.
FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.
FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.
From Armv8.2, the values 0b0110 and 0b1011 are not permitted.
From Armv8.4, the value 0b1000 is not permitted.
From Armv8.8, the value 0b1001 is not permitted.

Accessing ID_AA64DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

D17.2.61 ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

**Purpose**

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64ISAR0_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>

<tr>
<td>TS</td>
<td>55:52</td>
<td>Indicates support for flag manipulation instructions.</td>
</tr>
</tbody>
</table>

**RNDR, bits [63:60]**

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of SCR_EL3.TRNDR.

Defined values are:

- 0b0000: No Random Number instructions are implemented.
- 0b0001: RNDR and RNDRRS registers are implemented.
- All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

**TLB, bits [59:56]**

Indicates support for Outer Shareable and TLB range maintenance instructions. Defined values are:

- 0b0000: Outer Shareable and TLB range maintenance instructions are not implemented.
- 0b0001: Outer Shareable TLB maintenance instructions are implemented.
- 0b0010: Outer Shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT_TLBBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

**TS, bits [55:52]**

Indicates support for flag manipulation instructions. Defined values are:

- 0b0000: No flag manipulation instructions are implemented.
- 0b0001: CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
- 0b0010: CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.
All other values are reserved.

**FEAT_FlagM** implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0010.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

**FHM, bits [51:48]**

Indicates support for FMLAL and FMLSL instructions. Defined values are:

- 0b0000  FMLAL and FMLSL instructions are not implemented.
- 0b0001  FMLAL and FMLSL instructions are implemented.

All other values are reserved.

**FEAT_FHM** implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**DP, bits [47:44]**

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

- 0b0000  No Dot Product instructions implemented.
- 0b0001  UDOT and SDOT instructions implemented.

All other values are reserved.

**FEAT_DotProd** implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**SM4, bits [43:40]**

Indicates support for SM4 instructions in AArch64 state. Defined values are:

- 0b0000  No SM4 instructions implemented.
- 0b0001  SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If **FEAT_SM4** is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

**SM3, bits [39:36]**

Indicates support for SM3 instructions in AArch64 state. Defined values are:

- 0b0000  No SM3 instructions implemented.
- 0b0001  SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If **FEAT_SM3** is not implemented, the value 0b0001 is reserved.

**FEAT_SM3** implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

**SHA3, bits [35:32]**

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

- 0b0000  No SHA3 instructions implemented.
- 0b0001  EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.
If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

RDM, bits [31:28]
Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

0b0000  No RDMA instructions implemented.
0b0001  SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

TME, bits [27:24]
Indicates support for TME instructions. Defined values are:

0b0000  TME instructions are not implemented.
0b0001  TCANCEL, TCOMMIT, TSTART, and TTEST instructions are implemented.

All other values are reserved.

Accessing this field has the following behavior:

•  RAZ/WI if all of the following are true:
   •  PSTATE.EL IN {EL2, EL1}
   •  SCR_EL3.TME == 0

•  RAZ/WI if all of the following are true:
   •  PSTATE.EL == EL1
   •  EL2Enabled()
   •  HCR_EL2.TME == 0

•  Otherwise, access to this field is RO

Atomic, bits [23:20]
Indicates support for Atomic instructions in AArch64 state. Defined values are:

0b0000  No Atomic instructions implemented.
0b010  LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

CRC32, bits [19:16]
Indicates support for CRC32 instructions in AArch64 state. Defined values are:

0b0000  No CRC32 instructions implemented.
0b0001  CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.
SHA2, bits [15:12]
Indicates support for SHA2 instructions in AArch64 state. Defined values are:
0b0000 No SHA2 instructions implemented.
0b0001 Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010 Implements instructions:
  • SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
  • SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.
All other values are reserved.
FEAT_SHA256 implements the functionality identified by the value 0b0001.
FEAT_SHA512 implements the functionality identified by the value 0b0010.
In Armv8, the permitted values are 0b0000 and 0b0001.
From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.
If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.
If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]
Indicates support for SHA1 instructions in AArch64 state. Defined values are:
0b0000 No SHA1 instructions implemented.
0b0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.
All other values are reserved.
FEAT_SHA1 implements the functionality identified by the value 0b0001.
From Armv8, the permitted values are 0b0000 and 0b0001.
If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

AES, bits [7:4]
Indicates support for AES instructions in AArch64 state. Defined values are:
0b0000 No AES instructions implemented.
0b0001 AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010 As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.
FEAT_AES implements the functionality identified by the value 0b0001.
FEAT_PMULL implements the functionality identified by the value 0b0010.
All other values are reserved.
From Armv8, the permitted values are 0b0000 and 0b0010.

Bits [3:0]
Reserved, RES0.

Accessing ID_AA64ISAR0_EL1
Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, ID_AA64ISAR0_EL1

D17.2.62 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64ISAR1_EL1 is a 64-bit register.

**LS64, bits [63:60]**

Indicates support for LD64B and ST64B* instructions, and the ACCDATA_EL1 register. Defined values of this field are:

- **0b0000** The LD64B, ST64B, ST64BV, and ST64BV0 instructions, the ACCDATA_EL1 register, and associated traps are not supported.
- **0b0001** The LD64B and ST64B instructions are supported.
- **0b0010** The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
- **0b0011** The LD64B, ST64B, ST64BV, and ST64BV0 instructions, the ACCDATA_EL1 register, and their associated traps are supported.

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

**XS, bits [59:56]**

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

- **0b0000** The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are not supported.
- **0b0001** The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.
I8MM, bits [55:52]
Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:
- 0b0000  Int8 matrix multiplication instructions are not implemented.
- 0b0001  SMMLA, SUDOT, UMMMLA, USMMLA, and USDOT instructions are implemented.
All other values are reserved.
FEAT_I8MM implements the functionality identified by 0b0001.
When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.
From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]
Indicates support for the Data Gathering Hint instruction. Defined values are:
- 0b0000  Data Gathering Hint is not implemented.
- 0b0001  Data Gathering Hint is implemented.
All other values are reserved.
FEAT_DGH implements the functionality identified by 0b0001.
From Armv8.0, the permitted values are 0b0000 and 0b0001.
If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

BF16, bits [47:44]
Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:
- 0b0000  BFloat16 instructions are not implemented.
- 0b0001  BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented.
- 0b0010  As 0b0001, but the FPCR.EBF field is also supported.
All other values are reserved.
FEAT_BF16 implements the functionality identified by 0b0001.
FEAT_EBF16  implements the functionality identified by 0b0010.
When FEAT_SVE or FEAT_SME are implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.
If FEAT_SME is implemented, the permitted values are 0b0001 and 0b0010.
Otherwise, from Armv8.6, the only permitted value is 0b0001.

SPECRES, bits [43:40]
Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:
- 0b0000  CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
- 0b0001  CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.
All other values are reserved.
FEAT_SPECRES implements the functionality identified by 0b0001.
In Armv8.0, the permitted values are 0b0000 and 0b0001.
From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]
Indicates support for SB instruction in AArch64 state. Defined values are:
- 0b0000  SB instruction is not implemented.
SB instruction is implemented.
All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.
In Armv8.0, the permitted values are 0b0000 and 0b0001.
From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]
Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:
- 0b0000: FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
- 0b0001: FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.
All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.
From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]
Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:
- 0b0000: Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
- 0b0001: Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.
All other values are reserved.

FEAT_PACIMP implements the functionality identified by 0b0001.
From Armv8.3, the permitted values are 0b0000 and 0b0001.
If the value of ID_AA64ISAR1_EL1.GPA is non-zero, or the value of ID_AA64ISAR2_EL1.GPA3 is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]
Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:
- 0b0000: Generic Authentication using the QARMA5 algorithm is not implemented.
- 0b0001: Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction.
All other values are reserved.

FEAT_PACQARMA5 implements the functionality identified by 0b0001.
From Armv8.3, the permitted values are 0b0000 and 0b0001.
If the value of ID_AA64ISAR1_EL1.GPI is non-zero, or the value of ID_AA64ISAR2_EL1.GPA3 is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]
Indicates support for weaker release consistency, RCpc, based model. Defined values are:
- 0b0000: The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.
- 0b0001: The LDAPR* instructions are implemented.
The LDAPUR*, and STLUR* instructions are not implemented.
- 0b0010: The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.
All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.
FEAT_LRCPC2 implements the functionality identified by the value 0b0010.
In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.
In Armv8.3, the permitted values are 0b0001 and 0b0010.
From Armv8.4, the only permitted value is 0b0010.

**FCMA, bits [19:16]**

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:
- 0b0000: The FCMLA and FCADD instructions are not implemented.
- 0b0001: The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.
In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.
From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.
From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**JSCVT, bits [15:12]**

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:
- 0b0000: The FJCVTZS instruction is not implemented.
- 0b0001: The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.
In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.
From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.
From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**API, bits [11:8]**

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:
- 0b0000: Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
- 0b0001: Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
- 0b0010: Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
- 0b0011: Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveFPAC() function returning FALSE.
- 0b0100: Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.
FEAT_EPAC implements the functionality identified by 0b0010.
FEAT_PAuth2 implements the functionality identified by 0b0011.
FEAT_FPAC implements the functionality identified by 0b0100.
FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACIMP is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.
From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, or the value of ID_AA64ISAR2_EL1.APA3 is non-zero, this field must have the value 0b0000.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

0b0000 Address Authentication using the QARMA5 algorithm is not implemented.
0b0001 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.
FEAT_EPAC implements the functionality identified by 0b0010.
FEAT_PAuth2 implements the functionality identified by 0b0011.
FEAT_FPAC implements the functionality identified by 0b0100.
FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA5 is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.
From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, or the value of ID_AA64ISAR2_EL1.APA3 is non-zero, this field must have the value 0b0000.
DPB, bits [3:0]

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are:

- 0b0000   DC CVAP not supported.
- 0b0001   DC CVAP supported.
- 0b0010   DC CVAP and DC CVADP supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.
From Armv8.5, the only permitted value is 0b0010.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

\[
MRS \langle Xt \rangle, ID_{AA64ISAR1\_EL1}
\]

<table>

```
D17.2.63 ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

--- Note ---

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_AA64ISAR2_EL1 is a 64-bit register.

**Bits [63:28]**

Reserved, RES0.

**PAC_frac, bits [27:24]**

Indicates whether the ConstPACField() function used as part of the PAC addition returns FALSE or TRUE.

0b0000  ConstPACField() returns FALSE.
0b0001  ConstPACField() returns TRUE.

All other values are reserved.

FEAT_CONSTPACFIELD implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**BC, bits [23:20]**

Indicates support for the BC instruction in AArch64 state. Defined values are:

0b0000  BC instruction is not implemented.
0b0001  BC instruction is implemented.

All other values are reserved.

FEAT_HBC implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

**MOPS, bits [19:16]**

Indicates support for the Memory Copy and Memory Set instructions in AArch64 state.

0b0000  The Memory Copy and Memory Set instructions are not implemented in AArch64 state.
0b0001 The Memory Copy and Memory Set instructions are implemented in AArch64 state with the following exception. If FEAT_MTE is implemented, then SETGP*, SETGM* and SETGE* instructions are also supported.

All other values are reserved.

FEAT_MOPS implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

APA3, bits [15:12]

Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

- 0b0000 Address Authentication using the QARMA3 algorithm is not implemented.
- 0b0001 Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
- 0b0010 Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
- 0b0011 Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
- 0b0100 Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
- 0b0101 Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA3 is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, or the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.

GPA3, bits [11:8]

Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

- 0b0000 Generic Authentication using the QARMA3 algorithm is not implemented.
- 0b0001 Generic Authentication using the QARMA3 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA3 implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.
If the value of `ID_AA64ISAR1_EL1.GPI` is non-zero, or the value of `ID_AA64ISAR1_EL1.GPA` is non-zero, this field must have the value `0b0000`.

**RPRES, bits [7:4]**

Indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state, when `FPCR.AH` is 1. Defined values are:

- **0b0000** When `FPCR.AH == 1`:
  Reciprocal and reciprocal square root estimates give 8 bits of mantissa, when `FPCR.AH` is 1.
- **0b0001** When `FPCR.AH == 1`:
  Reciprocal and reciprocal square root estimates give 12 bits of mantissa, when `FPCR.AH` is 1.

All other values are reserved.

**FEAT_RPRES** implements the functionality identified by the value `0b0001`.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is `0b0001`.

**WFxT, bits [3:0]**

Indicates support for the `WFET` and `WFIT` instructions in AArch64 state. Defined values are:

- **0b0000** `WFET` and `WFIT` are not supported.
- **0b0010** `WFET` and `WFIT` are supported, and the register number is reported in the ESR_ELx on exceptions.

All other values are reserved.

**FEAT_WFxT** implements the functionality identified by the value `0b0010`.

From Armv8.7, the only permitted value is `0b0010`.

### Accessing `ID_AA64ISAR2_EL1`

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, ID_AA64ISAR2_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

```
D17.2.64 ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64MMFR0_EL1 is a 64-bit register.

**ECV, bits [63:60]**

Indicates presence of Enhanced Counter Virtualization. Defined values are:

- **0b0000** Enhanced Counter Virtualization is not implemented.
- **0b0001** Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2, {EL1ITVT, EL1TVCT, EL1NVPCT, EL1NVCVT, EVNTIS, CNTKCTL_EL1.EVNTIS, CNTPCTSS_EL0} counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1.PCT, PMSCR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.
- **0b0010** As 0b0001, and also includes support for CNTHCTL_EL2.ECV and CNTPOFF_EL2. All other values are reserved.

**FGT, bits [59:56]**

Indicates presence of the Fine-Grained Trap controls. Defined values are:

- **0b0000** Fine-grained trap controls are not implemented.
- **0b0001** Fine-grained trap controls are implemented. Supports:
  - If EL2 is implemented, the HAOFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2, HFGTR_EL2, and HFGWTR_EL2 registers, and their associated traps.
  - If EL2 is implemented, MDCR_EL2.TDCC.
  - If EL3 is implemented, MDCR_EL3.TDCC.
  - If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.

All other values are reserved.

**FEAT_ECV** implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.
From Armv8.6, the value 0b0000 is not permitted.

**Bits [55:48]**

Reserved, RES0.

**ExS, bits [47:44]**

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

- 0b0000: All exception entries and exits are context synchronization events.
- 0b0001: Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

**TGran4_2, bits [43:40]**

Indicates support for 4KB memory granule size at stage 2. Defined values are:

- 0b0000: Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.
- 0b0001: 4KB granule not supported at stage 2.
- 0b0010: 4KB granule supported at stage 2.
- 0b0011: When FEAT_LPA2 is implemented:
  4KB granule at stage 2 supports 52-bit input and output addresses.

All other values are reserved.

The 0b0000 value is deprecated.

--- Note ---

This field does not follow the standard ID scheme. See *Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes on page D17-5554* for more information.

**TGran64_2, bits [39:36]**

Indicates support for 64KB memory granule size at stage 2. Defined values are:

- 0b0000: Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
- 0b0001: 64KB granule not supported at stage 2.
- 0b0010: 64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

--- Note ---

This field does not follow the standard ID scheme. See *Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes on page D17-5554* for more information.

**TGran16_2, bits [35:32]**

Indicates support for 16KB memory granule size at stage 2. Defined values are:

- 0b0000: Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.
- 0b0001: 16KB granule not supported at stage 2.
- 0b0010: 16KB granule supported at stage 2.
- 0b0011: When FEAT_LPA2 is implemented:
  16KB granule at stage 2 supports 52-bit input and output addresses.

All other values are reserved.
The 0b0000 value is deprecated.

--- Note ---

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes on page D17-5554 for more information.

**TGran4, bits [31:28]**
Indicates support for 4KB memory translation granule size. Defined values are:

- 0b0000 4KB granule supported.
- 0b0001 *When FEAT_LPA2 is implemented:* 4KB granule supports 52-bit input and output addresses.
- 0b1111 4KB granule not supported.

All other values are reserved.

**TGran64, bits [27:24]**
Indicates support for 64KB memory translation granule size. Defined values are:

- 0b0000 64KB granule supported.
- 0b1111 64KB granule not supported.

All other values are reserved.

**TGran16, bits [23:20]**
Indicates support for 16KB memory translation granule size. Defined values are:

- 0b0000 16KB granule not supported.
- 0b0001 16KB granule supported.
- 0b0010 *When FEAT_LPA2 is implemented:* 16KB granule supports 52-bit input and output addresses.

All other values are reserved.

**BigEndEL0, bits [19:16]**
Indicates support for mixed-endian at EL0 only. Defined values are:

- 0b0000 No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
- 0b0001 Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

**SNSMem, bits [15:12]**
Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

- 0b0000 Does not support a distinction between Secure and Non-secure Memory.
- 0b0001 Does support a distinction between Secure and Non-secure Memory.

--- Note ---

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

**BigEnd, bits [11:8]**
Indicates support for mixed-endian configuration. Defined values are:

- 0b0000 No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001  Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be configured.

All other values are reserved.

**ASIDBits, bits [7:4]**

Number of ASID bits. Defined values are:

- 0b0000  8 bits.
- 0b0010  16 bits.

All other values are reserved.

**PARange, bits [3:0]**

Physical Address range supported. Defined values are:

- 0b0000  32 bits, 4GB.
- 0b0001  36 bits, 64GB.
- 0b0010  40 bits, 1TB.
- 0b0011  42 bits, 4TB.
- 0b0100  44 bits, 16TB.
- 0b0101  48 bits, 256TB.
- 0b0110  52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

**Accessing ID_AA64MMFR0_EL1**

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS}<Xt>, \text{ID-AA64MMFR0_EL1}

**Bits [63:60]**

Reserved, RES0.

**CMOW, bits [59:56]**

Indicates support for cache maintenance instruction permission. Defined values are:

- **0b0000** SCTLRL1.CMOW, SCTLRL2.CMOW, and HCRX_EL2.CMOW bits are not implemented.
- **0b0001** SCTLRL1.CMOW is implemented. If EL2 is implemented, SCTLRL2.CMOW and HCRX_EL2.CMOW bits are implemented.

All other values are reserved.

FEAT_CMOW implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

**TIDCP1, bits [55:52]**

Indicates whether SCTLRL1.TIDCP and SCTLRL2.TIDCP are implemented in AArch64 state. Defined values are:

- **0b0000** SCTLRL1.TIDCP and SCTLRL2.TIDCP bits are not implemented and are RES0.
- **0b0001** SCTLRL1.TIDCP bit is implemented. If EL2 is implemented, SCTLRL2.TIDCP bit is implemented.

All other values are reserved.

FEAT_TIDCP1 implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

**nTLBPA, bits [51:48]**

Indicates support for intermediate caching of translation table walks. Defined values are:

- **0b0000** The intermediate caching of translation table walks might include non-coherent physical translation caches.
The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

### AFP, bits [47:44]
Indicates support for FPCR.{AH, FIZ, NEP}. Defined values are:

- 0b0000 The FPCR.{AH, FIZ, NEP} fields are not supported.
- 0b0001 The FPCR.{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

### HCX, bits [43:40]
Indicates support for HCRX_EL2 and its associated EL3 trap. Defined values are:

- 0b0000 HCRX_EL2 and its associated EL3 trap are not supported.
- 0b0001 HCRX_EL2 and its associated EL3 trap are supported.

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

### ETS, bits [39:36]
Indicates support for Enhanced Translation Synchronization. Defined values are:

- 0b0000 Enhanced Translation Synchronization is not supported.
- 0b0001 Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

### TWED, bits [35:32]
Indicates support for the configurable delayed trapping of WFE. Defined values are:

- 0b0000 Configurable delayed trapping of WFE is not supported.
- 0b0001 Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.
XNX, bits [31:28]
Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:
0b0000 Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001 Distinction between EL0 and EL1 execute-never control at stage 2 supported.
All other values are reserved.
FEAT_XNX implements the functionality identified by the value 0b0001.
From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [27:24]
When FEAT_RAS is implemented:
Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches.
0b0000 The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001 The PE might generate an SError interrupt due to an External abort on a speculative read.
All other values are reserved.
Otherwise:
Reserved, RES0.

PAN, bits [23:20]
Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:
0b0000 PAN not supported.
0b0001 PAN supported.
0b0010 PAN supported and AT S1E1RP and AT S1E1WP instructions supported.
0b0011 PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported.
All other values are reserved.
FEAT_PAN implements the functionality identified by the value 0b0001.
FEAT_PAN2 implements the functionality added by the value 0b0010.
FEAT_PAN3 implements the functionality added by the value 0b0011.
In Armv8.1, the permitted values are 0b0001, 0b0010, and 0b0011.
From Armv8.2, the permitted values are 0b0010 and 0b0011.
From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]
LORegions. Indicates support for LORegions. Defined values are:
0b0000 LORegions not supported.
0b0001 LORegions supported.
All other values are reserved.
FEAT_LOR implements the functionality identified by the value 0b0001.
From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]
Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:
0b0000 Disabling of hierarchical controls not supported.
Disabling of hierarchical controls supported with the TCR_EL1.{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2.{HPD1, HPD0}, and TCR_EL3.HPD bits.

As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

**FEAT_HPDS** implements the functionality identified by the value 0b0001.

**FEAT_HPDS2** implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

**VH**, bits [11:8]

Virtualization Host Extensions. Defined values are:

- 0b0000 Virtualization Host Extensions not supported.
- 0b0001 Virtualization Host Extensions supported.

All other values are reserved.

**FEAT_VHE** implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**VomidBits**, bits [7:4]

Number of VMID bits. Defined values are:

- 0b0000 8 bits
- 0b0010 16 bits

All other values are reserved.

**FEAT_VMID16** implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

**HAFDBS**, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

- 0b0000 Hardware update of the Access flag and dirty state are not supported.
- 0b0001 Hardware update of the Access flag is supported.
- 0b0010 Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

**FEAT_HAFDBS** implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

**Accessing ID_AA64MMFR1_EL1**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, ID_AA64MMFR1_EL1**

D17.2.66 ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

### Configurations

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

### Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

**E0PD**  
Indicates support for the E0PD mechanism. Defined values are:

- 0b0000  E0PDx mechanism is not implemented.
- 0b0001  E0PDx mechanism is implemented.

All other values are reserved.

**FEAT_E0PD** implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

**EVT**  
Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

- 0b0000  HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
- 0b0001  HCR_EL2.{TOCU, TICAB, TID4} traps are supported. HCR_EL2.{TTLBOS, TTLBIS} traps are not supported.
- 0b0010  HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

**FEAT_EVT** implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
• 0b0010 when EL2 is implemented.

**BBM, bits [55:52]**

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

- 0b0000  Level 0 support for changing block size is supported.
- 0b0001  Level 1 support for changing block size is supported.
- 0b0010  Level 2 support for changing block size is supported.

All other values are reserved.

FEAT_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

**TTL, bits [51:48]**

Indicates support for TTL field in address operations. Defined values are:

- 0b0000  TLB maintenance instructions by address have bits[47:44] as RES0.
- 0b0001  TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1NXS, TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLBI VAAEI, TLBI VAAEI1XS, TLBI VAAEI1IS, TLBI VAAEI1ISNXS, TLBI VAAEI1OS, TLBI VAAEI1OSNXS, TLBI VAAEI0S, TLBI VAAEI0SXS, TLBI VAAEI0SNXS, TLBI VAAEI0SNXSNXS, TLBI VAAE1, TLBI VAAE1NXS, TLBI VAAE1IS, TLBI VAAE1ISNXS, TLBI VAAE1OS, TLBI VAAE1OSNXS, TLBI VAAE1OSNXS, TLBI VAAE0S, TLBI VAAE0SNXS, TLBI VAAE0SNXSNXS, TLBI VAAE0S, TLBI VAAE0SNXS, TLBI VAAE0SNXSNXS, TLBI VAAE2, TLBI VAAE2NXS, TLBI VAAE2IS, TLBI VAAE2ISNXS, TLBI VAAE2OS, TLBI VAAE2OSNXS, TLBI VAAE2OSNXS, TLBI VAE1, TLBI VAE1NXS, TLBI VAE1IS, TLBI VAE1ISNXS, TLBI VAE1OS, TLBI VAE1OSNXS, TLBI VAE1OSNXS, TLBI VAE0S, TLBI VAE0SNXS, TLBI VAE0SNXSNXS, TLBI VAE0S, TLBI VAE0SNXS, TLBI VAE0SNXSNXS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1ISNXS, TLBI VAE1OS, TLBI VAE1OSNXS, TLBI VAE2, TLBI VAE2NXS, TLBI VAE2IS, TLBI VAE2ISNXS, TLBI VAE2OS, TLBI VAE2OSNXS, TLBI VAE2OSNXS, TLBI VAE3, TLBI VAE3NXS, TLBI VAE3IS, TLBI VAE3ISNXS, TLBI VAE3OS, TLBI VAE3OSNXS, TLBI VAEC1, TLBI VAEC1NXS, TLBI VAEC1IS, TLBI VAEC1ISNXS, TLBI VAEC1OS, TLBI VAEC1OSNXS, TLBI VAEC2, TLBI VAEC2NXS, TLBI VAEC2IS, TLBI VAEC2ISNXS, TLBI VAEC2OS, TLBI VAEC2OSNXS, TLBI VAEC2OSNXS, TLBI VAEC3, TLBI VAEC3NXS, TLBI VAEC3IS, TLBI VAEC3ISNXS, TLBI VAEC3OS, TLBI VAEC3OSNXS, TLBI VAEC3OS, TLBI VAEC3OSNXS.

From Armv8.4, the only permitted value is 0b0001.

**Bits [47:44]**

Reserved, RES0.

**FWB, bits [43:40]**

Indicates support for HCR_EL2.FWB. Defined values are:

- 0b0000  HCR_EL2.FWB bit is not supported.
- 0b0001  HCR_EL2.FWB is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**IDS, bits [39:36]**

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

- 0b0000  An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT, is reported by ESR_ELx.EC == 0x0.
- 0b0001  All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.
All other values are reserved.
The Feature ID space is defined as the System register space in AArch64 with op0==3, op1==\{0, 1, 3\}, CRn==0, CRm==\{0-7\}, op2==\{0-7\}.

**FEAT_IDST** implements the functionality identified by the value \(0b0001\).

From Armv8.4, the only permitted value is \(0b0001\).

**AT, bits [35:32]**

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:
- \(0b0000\) Unaligned single-copy atomicity and atomic functions are not supported.
- \(0b0001\) Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

**FEAT_LSE2** implements the functionality identified by the value \(0b0001\).

In Armv8.2, the permitted values are \(0b0000\) and \(0b0001\).

From Armv8.4, the only permitted value is \(0b0001\).

**ST, bits [31:28]**

Identifies support for small translation tables. Defined values are:
- \(0b0000\) The maximum value of the TCR_ELx.\{T0SZ,T1SZ\} and VTCR_EL2.T0SZ fields is 39.
- \(0b0001\) The maximum value of the TCR_ELx.\{T0SZ,T1SZ\} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

**FEAT_TTST** implements the functionality identified by the value \(0b0001\).

If **FEAT_SEL2** is implemented, the only permitted value is \(0b0001\).

In an implementation which does not support **FEAT_SEL2**, the permitted values are \(0b0000\) and \(0b0001\).

**NV, bits [27:24]**

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:
- \(0b0000\) Nested virtualization is not supported.
- \(0b0001\) The HCR_EL2.\{AT, NV1, NV\} bits are implemented.
- \(0b0010\) The VNCR_EL2 register and the HCR_EL2.\{NV2, AT, NV1, NV\} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is \(0b0000\).

**FEAT_NV** implements the functionality identified by the value \(0b0001\).

**FEAT_NV2** implements the functionality identified by the value \(0b0010\).

In Armv8.3, if EL2 is implemented, the permitted values are \(0b0000\) and \(0b0001\).

From Armv8.4, if EL2 is implemented, the permitted values are \(0b0000\), \(0b0001\), and \(0b0010\).

**CCIDX, bits [23:20]**

Support for the use of revised CCSIDR_EL1 register format. Defined values are:
- \(0b0000\) 32-bit format implemented for all levels of the CCSIDR_EL1.
- \(0b0001\) 64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

**FEAT_CCIDX** implements the functionality identified by the value \(0b0001\).

From Armv8.3, the permitted values are \(0b0000\) and \(0b0001\).
VARange, bits [19:16]
Indicates support for a larger virtual address. Defined values are:
0b0000  VMSAv8-64 supports 48-bit VAs.
0b0001  VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for
other translation granules is not defined by this field.
All other values are reserved.
FEAT_LVA implements the functionality identified by the value 0b0001.
From Armv8.2, the permitted values are 0b0000 and 0b0001.

IESB, bits [15:12]
Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:
0b0000  IESB bit in the SCTLR_ELx registers is not supported.
0b0001  IESB bit in the SCTLR_ELx registers is supported.
All other values are reserved.
FEAT_IESB implements the functionality identified by the value 0b0001.

LSM, bits [11:8]
Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2. Defined
values are:
0b0000  LSMAOE and nTLSMD bits not supported.
0b0001  LSMAOE and nTLSMD bits supported.
All other values are reserved.
FEAT_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]
User Access Override. Defined values are:
0b0000  UAO not supported.
0b0001  UAO supported.
All other values are reserved.
FEAT_UAO implements the functionality identified by the value 0b0001.
From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]
Indicates support for Common not Private translations. Defined values are:
0b0000  Common not Private translations not supported.
0b0001  Common not Private translations supported.
All other values are reserved.
FEAT_TTCNP implements the functionality identified by the value 0b0001.
From Armv8.2, the only permitted value is 0b0001.

Accessing ID_AA64MMFR2_EL1
Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, ID_AAA64MMFR2_EL1

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

**ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0**

The ID_AA64PFR0_EL1 characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

The external register EDPFR gives information from this register.

**Attributes**

ID_AA64PFR0_EL1 is a 64-bit register.

**CSV3, bits [63:60]**

Speculative use of faulting data. Defined values are:

- **0b0000** This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.

- **0b0001** Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

**FEAT_CSV3** implements the functionality identified by the value **0b0001**.

In Armv8.0, the permitted values are **0b0000** and **0b0001**.

From Armv8.5, the only permitted value is **0b0001**.

If **FEAT_E0PD** is implemented, **FEAT_CSV3** must be implemented.

**CSV2, bits [59:56]**

Speculative use of out of context branch targets. Defined values are:

- **0b0000** The implementation does not disclose whether **FEAT_CSV2** is implemented.

- **0b0001** **FEAT_CSV2** is implemented, but **FEAT_CSV2_2** and **FEAT_CSV2_3** are not implemented.

  **ID_AA64PFR1_EL1.CSV2_frac** determines whether either or both of **FEAT_CSV2_1p1** or **FEAT_CSV2_1p2** are implemented.

- **0b0010** **FEAT_CSV2_2** is implemented, but **FEAT_CSV2_3** is not implemented.

- **0b0011** **FEAT_CSV2_3** is implemented.

All other values are reserved.

**FEAT_CSV2** implements the functionality identified by the value **0b0001**.

**FEAT_CSV2_2** implements the functionality identified by the value **0b0010**.
FEAT_CSV2_3 implements the functionality identified by the feature 0b0011.
In Armv8.0, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.
From Armv8.5, the permitted values are 0b0001, 0b0010, and 0b0011.

RME, bits [55:52]
Realm Management Extension (RME). Defined values are:

- 0b0000  Realm Management Extension not implemented.
- 0b0001  RMEv1 is implemented.

All other values are reserved.
FEAT_RME implements the functionality identified by the value 0b0001.

DIT, bits [51:48]
Data Independent Timing. Defined values are:

- 0b0000  AArch64 does not guarantee constant execution time of any instructions.
- 0b0001  AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time
of certain instructions.

All other values are reserved.
FEAT_DIT implements the functionality identified by the value 0b0001.
From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]
Indicates support for Activity Monitors Extension. Defined values are:

- 0b0000  Activity Monitors Extension is not implemented.
- 0b0001  FEAT_AMUv1 is implemented.
- 0b0010  FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the
activity monitor event counters.

All other values are reserved.
FEAT_AMUv1 implements the functionality identified by the value 0b0001.
FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.
In Armv8.0, the only permitted value is 0b0000.
In Armv8.4, the permitted values are 0b0000 and 0b0001.
From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

MPAM, bits [43:40]
Indicates the major version number of support for the MPAM Extension.
Defined values are:

- 0b0000  The major version number of the MPAM extension is 0.
- 0b0001  The major version number of the MPAM extension is 1.

All other values are reserved.
When combined with the minor version number from ID_AA64PFR1_EL1.MPAM_frac, the
"major.minor" version is:

<table>
<thead>
<tr>
<th>MPAM Extension version</th>
<th>MPAM</th>
<th>MPAM_frac</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not implemented.</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
</tbody>
</table>
SEL2, bits [39:36]

Secure EL2. Defined values are:
- 0b0000 Secure EL2 is not implemented.
- 0b0001 Secure EL2 is implemented.

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:
- 0b0000 SVE architectural state and programmers' model are not implemented.
- 0b0001 SVE architectural state and programmers' model are implemented.

All other values are reserved.

FEAT_SVE implements the functionality identified by the value 0b0001.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. Defined values are:
- 0b0000 No RAS Extension.
- 0b0001 RAS Extension implemented.
- 0b0010 FEAT_RASv1p1 implemented and, if EL3 is implemented, FEAT_DoubleFault implemented. As 0b0001, and adds support for:
  - If EL3 is implemented, FEAT_DoubleFault.
  - Additional ERXMISCmn_EL1 System registers.
  - Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1 is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

---

For more information, see FEAT_MPAM.
Note

When the value of this field is 0b0001, ID_AA64PFR1_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

GIC, bits [27:24]
System register GIC CPU interface. Defined values are:

- **0b0000**: GIC CPU interface system registers not implemented.
- **0b0001**: System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- **0b0011**: System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

AdvSIMD, bits [23:20]
Advanced SIMD. Defined values are:

- **0b0000**: Advanced SIMD is implemented, including support for the following SISD and SIMD operations:
  - Integer byte, halfword, word and doubleword element operations.
  - Single-precision and double-precision floating-point arithmetic.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- **0b0001**: As for 0b0000, and also includes support for half-precision floating-point arithmetic.
- **0b1111**: Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- **0b0000**: in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- **0b0001**: in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- **0b1111**: in an implementation without Advanced SIMD support.

FP, bits [19:16]
Floating-point. Defined values are:

- **0b0000**: Floating-point is implemented, and includes support for:
  - Single-precision and double-precision floating-point types.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- **0b0001**: As for 0b0000, and also includes support for half-precision floating-point arithmetic.
- **0b1111**: Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- **0b0000**: in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- **0b0001**: in an implementation with floating-point support that includes the FEAT_FP16 extension.
- **0b1111**: in an implementation without floating-point support.
EL3, bits [15:12]

EL3 Exception level handling. Defined values are:
- 0b0000  EL3 is not implemented.
- 0b0001  EL3 can be executed in AArch64 state only.
- 0b0010  EL3 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:
- 0b0000  EL2 is not implemented.
- 0b0001  EL2 can be executed in AArch64 state only.
- 0b0010  EL2 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:
- 0b0001  EL1 can be executed in AArch64 state only.
- 0b0010  EL1 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:
- 0b0001  EL0 can be executed in AArch64 state only.
- 0b0010  EL0 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

D17.2.68   ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64PFR1_EL1 is a 64-bit register.

**Field descriptions**

<tr>
<td>The values 0b0001 and 0b0010 are permitted only when ID_AA64PFR0_EL1.CSV2 is 0b0001.</td>
<td></td>
</tr>
</tbody>
</table>
**RNDR_trap, bits [31:28]**

Random Number trap to EL3 field. Defined values are:

- **0b0000**  Trapping of RNDR and RNDRRS to EL3 is not supported.
- **0b0001**  Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3.TRNDR is present.

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

**SME, bits [27:24]**

Scalable Matrix Extension. Defined values are:

- **0b0000**  SME architectural state and programmers' model are not implemented.
- **0b0001**  SME architectural state and programmers' model are implemented.

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0001.

From Armv9.2, the permitted values are **0b0000** and **0b0001**.

If implemented, refer to ID_AA64SMFR0_EL1 and ID_AA64ZFR0_EL1 for information about which SME and SVE instructions are available.

**Bits [23:20]**

Reserved, RES0.

**MPAM_frac, bits [19:16]**

Indicates the minor version number of support for the MPAM Extension.

Defined values are:

- **0b0000**  The minor version number of the MPAM extension is 0.
- **0b0001**  The minor version number of the MPAM extension is 1.

All other values are reserved.

When combined with the major version number from ID_AA64PFR0_EL1.MPAM, The combined "major.minor" version is:

<table>
<thead>
<tr>
<th>MPAM Extension version</th>
<th>MPAM</th>
<th>MPAM_frac</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not implemented.</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>v0.1 is implemented.</td>
<td>0b0000</td>
<td>0b0001</td>
</tr>
<tr>
<td>v1.0 is implemented.</td>
<td>0b0001</td>
<td>0b0000</td>
</tr>
<tr>
<td>v1.1 is implemented.</td>
<td>0b0001</td>
<td>0b0001</td>
</tr>
</tbody>
</table>

For more information, see *The Memory Partitioning and Monitoring (MPAM) Extension* on page A2-126.

**RAS_frac, bits [15:12]**

RAS Extension fractional field. Defined values are:

- **0b0000**  If ID_AA64PFR0_EL1.RAS == 0b0001, RAS Extension implemented.
- **0b0001**  If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for:
  - Additional ERXMisc<m>_EL1 System registers.
  - Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.
Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<\textit{n}>STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

**FEAT\_RASv1p1** implements the functionality identified by the value \texttt{0b0001}.

This field is valid only if \texttt{ID\_AA64PFR0\_EL1.RAS} \(\equiv \texttt{0b0001}\).

### MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

- \texttt{0b0000}: Memory Tagging Extension is not implemented.
- \texttt{0b0001}: Instruction-only Memory Tagging Extension is implemented.
- \texttt{0b0010}: Full Memory Tagging Extension is implemented.
- \texttt{0b0011}: Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.

All other values are reserved.

**FEAT\_MTE** implements the functionality identified by the value \texttt{0b0001}.

**FEAT\_MTE2** implements the functionality identified by the value \texttt{0b0010}.

**FEAT\_MTE3** implements the functionality identified by the value \texttt{0b0011}.

In Armv8.5, the permitted values are \texttt{0b0000}, \texttt{0b0001}, \texttt{0b0010}, and \texttt{0b0011}.

From Armv8.7, the value \texttt{0b0010} is not permitted.

### SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

- \texttt{0b0000}: AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
- \texttt{0b0001}: AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
- \texttt{0b0010}: As \texttt{0b0001}, and adds the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

**FEAT\_SSBS** implements the functionality identified by the value \texttt{0b0001}.

**FEAT\_SBSS2** implements the functionality identified by the value \texttt{0b0010}.

### BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

- \texttt{0b0000}: The Branch Target Identification mechanism is not implemented.
- \texttt{0b0001}: The Branch Target Identification mechanism is implemented.

All other values are reserved.

**FEAT\_BTI** implements the functionality identified by the value \texttt{0b0001}.

From Armv8.5, the only permitted value is \texttt{0b0001}.

### Accessing ID\_AA64PFR1\_EL1

Accesses to this register use the following encodings in the System register encoding space:
### MRS <Xt>, ID_AA64PFR1_EL1

ID_AA64SMFR0_EL1, SME Feature ID register 0

The ID_AA64SMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented features of the AArch64 Scalable Matrix Extension.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

Configurations

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64SMFR0_EL1 is a 64-bit register.

Field descriptions

FA64, bit [63]

Indicates support for execution of the full A64 instruction set when the PE is in Streaming SVE mode. Defined values are:

0b0 Only those A64 instructions defined as being legal can be executed in Streaming SVE mode.

0b1 All implemented A64 instructions are legal for execution in Streaming SVE mode, when enabled at the current Exception level by SMCR_EL1.FA64, SMCR_EL2.FA64, and SMCR_EL3.FA64.

FEAT_SME_FA64 implements the functionality identified by the value 0b1.

Bits [62:60]

Reserved, RES0.

SMEver, bits [59:56]

When ID_AA64PFRI_EL1.SME != 0b0000:

Indicates support for SME instructions when FEAT_SME is implemented. Defined values are:

0b0000 The mandatory SME instructions are implemented.

All other values are reserved.

If FEAT_SME is implemented the only permitted value is 0b0000.

Otherwise:

Reserved, RES0.
I16I64, bits [55:52]
Indicates SME support for instructions that accumulate into 64-bit integer elements in the ZA array. Defined values are:

0b0000  Instructions that accumulate into 64-bit integer elements in the ZA array are not implemented.

0b1111  The variants of the ADDHA, ADDVA, SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate into 64-bit integer tiles are implemented.

All other values are reserved.
FEAT_SME_I16I64 implements the functionality identified by the value 0b1111.
The only permitted values are 0b0000 and 0b1111.

Bits [51:49]
Reserved, RES0.

F64F64, bit [48]
Indicates SME support for instructions that accumulate into FP64 double-precision floating-point elements in the ZA array. Defined values are:

0b0  Instructions that accumulate into double-precision floating-point elements in the ZA array are not implemented.

0b1  The variants of the FMOPA and FMOPS instructions that accumulate into double-precision tiles are implemented.

FEAT_SME_F64F64 implements the functionality identified by the value 0b1.

Bits [47:40]
Reserved, RES0.

I8I32, bits [39:36]
Indicates SME support for instructions that accumulate 8-bit integer outer products into 32-bit integer tiles. Defined values are:

0b0000  Instructions that accumulate 8-bit outer products into 32-bit tiles are not implemented.

0b1111  The SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate 8-bit outer products into 32-bit tiles are implemented.

All other values are reserved.
If FEAT_SME is implemented, the only permitted value is 0b1111.

F16F32, bit [35]
Indicates SME support for instructions that accumulate FP16 half-precision floating-point outer products into FP32 single-precision floating-point tiles. Defined values are:

0b0  Instructions that accumulate half-precision outer products into single-precision tiles are not implemented.

0b1  The FMOPA and FMOPS instructions that accumulate half-precision outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

B16F32, bit [34]
Indicates SME support for instructions that accumulate BFloat16 outer products into FP32 single-precision floating-point tiles. Defined values are:

0b0  Instructions that accumulate BFloat16 outer products into single-precision tiles are not implemented.
0b1  The BFMOPA and BFMOPS instructions that accumulate BFloat16 outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

**Bit [33]**

Reserved, RES0.

**F32F32, bit [32]**

Indicates SME support for instructions that accumulate FP32 single-precision floating-point outer products into single-precision floating-point tiles. Defined values are:

0b0  Instructions that accumulate single-precision outer products into single-precision tiles are not implemented.

0b1  The FMOPA and FMOPS instructions that accumulate single-precision outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

**Bits [31:0]**

Reserved, RES0.

### Accessing ID_AA64SMFR0_EL1

This register is read-only and can be accessed from EL1 and higher.

This register is only accessible from the AArch64 state.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, ID_AA64SMFR0_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

```
D17.2.70   ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension instruction set, when one or more of FEAT_SVE and FEAT_SME is implemented.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

Configurations

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

If FEAT_SME is implemented and FEAT_SVE is not implemented, then SVE instructions can only be executed when the PE is in Streaming SVE mode and the instructions are legal to execute in Streaming SVE mode.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

0b0000 Double-precision matrix multiplication and related instructions are not implemented.

0b0001 Double-precision variant of the FMMLA instruction, and the LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.

All other values are reserved.

FEAT_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

0b0000 Single-precision matrix multiplication instruction is not implemented.

0b0001 Single-precision variant of the FMMLA instruction is implemented.

All other values are reserved.

FEAT_F32MM implements the functionality identified by 0b0001.
From Arm v8.2, the permitted values are 0b0000 and 0b0001.

**Bits [51:48]**

Reserved, RES0.

**I8MM, bits [47:44]**

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

- 0b0000  Int8 matrix multiplication instructions are not implemented.
- 0b0001  SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

**SM4, bits [43:40]**

Indicates support for SVE SM4 instructions. Defined values are:

- 0b0000  SVE SM4 instructions are not implemented.
- 0b0001  SVE SM4E and SM4EKEY instructions are implemented.

All other values are reserved.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

**Bits [39:36]**

Reserved, RES0.

**SHA3, bits [35:32]**

Indicates support for the SVE SHA3 instructions. Defined values are:

- 0b0000  SVE SHA3 instructions are not implemented.
- 0b0001  SVE RAX1 instruction is implemented.

All other values are reserved.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.

**Bits [31:24]**

Reserved, RES0.

**BF16, bits [23:20]**

Indicates support for SVE BFloat16 instructions. Defined values are:

- 0b0000  BFloat16 instructions are not implemented.
- 0b0001  BFCVT, BFCVTNT, BF DOT, BFMLALB, BFMLALT, and BFMM MLA instructions are implemented.
- 0b0010  As 0b0001, but the FPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

This field must return the same value as ID_AA64ISAR1_EL1.BF16.

If FEAT_SME is implemented, the permitted values are 0b0001 and 0b0010.

Otherwise, from Armv8.6, the only permitted value is 0b0001.
BitPerm, bits [19:16]
Indicates support for SVE bit permute instructions. Defined values are:
0b0000  SVE bit permute instructions are not implemented.
0b0001  SVE BDEP, BEXT, and BGRP instructions are implemented.
All other values are reserved.
FEAT_SVE_BitPerm implements the functionality identified by 0b0001.

Bits [15:8]
Reserved, RES0.

AES, bits [7:4]
Indicates support for SVE AES instructions. Defined values are:
0b0000  SVE AES instructions are not implemented.
0b0001  SVE AESE, AESD, AESMC, and AESIMC instructions are implemented.
0b0010  As 0b0001, plus SVE PMULLB and PMULLT instructions with 64-bit source.
All other values are reserved.
FEAT_SVE_AES implements the functionality identified by the value 0b0001.
FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.
The permitted values are 0b0000 and 0b0010.

SVEver, bits [3:0]
Indicates support for SVE instructions when one or more of FEAT_SME and FEAT_SVE is implemented. Defined values are:
0b0000  The SVE instructions are implemented.
0b0001  As 0b0000, and adds the mandatory SVE2 instructions.
All other values are reserved.
From Armv9, if this register is present, the value 0b0000 is not permitted.
FEAT_SVE2 adds the functionality identified by 0b0001 when the PE is not in Streaming SVE mode.
FEAT_SME adds the functionality identified by 0b0001 when the PE is in Streaming SVE mode.

Accessing ID_AA64ZFR0_EL1

D17.2.71  ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

**Purpose**

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

**Attributes**

ID_AFR0_EL1 is a 64-bit register.

D17.2.72  ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR0[31:0].

**Attributes**

ID_DFR0_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

![Field Descriptions Diagram](image)

**Bits [63:32]**

Reserved, RES0.

**TraceFilt, bits [31:28]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**PerfMon, bits [27:24]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in *Alternative ID scheme used for the Performance Monitors Extension version* on page D17-5553

Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Performance Monitors Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Performance Monitors Extension, PMUv1 implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Performance Monitors Extension, PMUv2 implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Performance Monitors Extension, PMUv3 implemented.</td>
</tr>
<tr>
<td>0b0100</td>
<td>PMUv3 for Armv8.1. As 0b0011, and adds support for:</td>
</tr>
<tr>
<td></td>
<td>• Extended 16-bit PMEVTYPER&lt;n&gt;.evtCount field.</td>
</tr>
<tr>
<td></td>
<td>• If EL2 is implemented, the HDCR.HPMD control.</td>
</tr>
</tbody>
</table>
PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.

PMUv3 for Armv8.5. As 0b0101, and adds support for:
- 64-bit event counters.
- If EL2 is implemented, the HDCR.HCCD control.
- If EL3 is implemented, the MDCR_EL3.SCCD control.

PMUv3 for Armv8.7. As 0b0110, and adds support for:
- The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls.
- If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.

PMUv3 for Armv8.8. As 0b0111, and:
- Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF.
- Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.

IMPLEMENATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.
FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.
FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.
FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.
FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.
FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.
From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.
From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.
From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.
From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.
From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

--- Note ---
PMUv1 and PMUv2 are not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]
M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:
0b0000  Not supported.
0b0001  Support for M-profile Debug architecture, with memory-mapped access.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]
Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:
0b0000  Not supported.
0b0001  Support for Arm trace architecture, with memory-mapped access.
All other values are reserved.
In Armv8-A, the permitted values are 0b0000 and 0b0001.
For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

**CopTrc, bits [15:12]**
Support for System registers-based trace model, using registers in the coproc = 0b1110 encoding space. Defined values are:
- 0b0000 Not supported.
- 0b0001 Support for Arm trace architecture, with System registers access.
All other values are reserved.
In Armv8-A, the permitted values are 0b0000 and 0b0001.
For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

**MMapDbg, bits [11:8]**
Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:
- 0b0000 Not supported.
- 0b0100 Support for Armv7, v7 Debug architecture, with memory-mapped access.
- 0b0101 Support for Armv7, v7.1 Debug architecture, with memory-mapped access.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.
The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDbg, bits [7:4]**
Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.
If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**
Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:
- 0b0000 Not supported.
- 0b0010 Armv6, v6 Debug architecture, with System registers access.
- 0b0011 Armv6, v6.1 Debug architecture, with System registers access.
- 0b0100 Armv7, v7 Debug architecture, with System registers access.
- 0b0101 Armv7, v7.1 Debug architecture, with System registers access.
- 0b0110 Armv8 debug architecture.
- 0b0111 Armv8 debug architecture with Virtualization Host Extensions.
- 0b1000 Armv8.2 debug architecture, FEAT_Debugv8p2.
- 0b1001 Armv8.4 debug architecture, FEAT_Debugv8p4.
- 0b1010 Armv8.8 debug architecture, FEAT_Debugv8p8.
All other values are reserved.
The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.
FEAT_VHE adds the functionality identified by the value 0b0111.
FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.
FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.
FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.
From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.
From Armv8.2, the values 0b0110 and 0b0111 are not permitted.
From Armv8.4, the value 0b1000 is not permitted.
From Armv8.8, the value 0b1001 is not permitted.

Otherwise:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Reserved, UNKNOWN.</th>
</tr>
</thead>
</table>

**Accessing ID_DFR0_EL1**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, ID_DFR0_EL1**

if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() & HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
    else
      UNDEFINED;
  elsif PSTATE.EL == EL1 then
    if EL2Enabled() & HCR_EL2.TID3 == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      X[t, 64] = ID_DFR0_EL1;
  elseif PSTATE.EL == EL2 then
    X[t, 64] = ID_DFR0_EL1;
  elseif PSTATE.EL == EL3 then
    X[t, 64] = ID_DFR0_EL1;
### D17.2.73 ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_DFR1_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-8</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td>HPMN0, Multi-threaded PMU extension</td>
<td>0b0000: Setting HDCR.HPMN to zero has CONSTRINED UNPREDICTABLE behavior. 0b0001: Setting HDCR.HPMN to zero has defined behavior. All other values are reserved.</td>
</tr>
<tr>
<td>3-0</td>
<td>MTPMU, Multi-threaded PMU</td>
<td>0b0000: FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPE&lt;\n&gt;M. MT are read/write or RES0. 0b0001: FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPE&lt;\n&gt;M. MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPE&lt;\n&gt;M. MT are 0.</td>
</tr>
</tbody>
</table>

Reserved, RES0.
0b1111 FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTPYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

**Otherwise:**

| 63 | 32 |
|------------------|
| UNKNOWN          |
|                  |

| 31 | 0 |
|------------------|
| UNKNOWN          |

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing ID_DFR1_EL1**

Accesses to this register use the following encodings in the System register encoding space:

```
D17.2.74  ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

**Attributes**

ID_ISAR0_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>BitField</th>
<th>BitCount</th>
<th>Swap</th>
<th>CmpBranch</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Divide</td>
<td>Debug</td>
<td>Coproc</td>
</tr>
</tbody>
</table>

**Bits [63:28]**

Reserved, RES0.

**Divide, bits [27:24]**

Indicates the implemented Divide instructions. Defined values are:

- **0b0000** None implemented.
- **0b0001** Adds SDIV and UDIV in the T32 instruction set.
- **0b0010** As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Debug, bits [23:20]**

Indicates the implemented Debug instructions. Defined values are:

- **0b0000** None implemented.
- **0b0001** Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Coproc, bits [19:16]**

Indicates the implemented System register access instructions. Defined values are:

- **0b0000** None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
- **0b0001** Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010   As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011   As for 0b0010, and adds generic MCRR and MRRC.
0b0100   As for 0b0011, and adds generic MCRR2 and MRRC2.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]
Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.
Defined values are:
0b0000   None implemented.
0b0001   Adds CBNZ and CBZ.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]
Indicates the implemented BitField instructions. Defined values are:
0b0000   None implemented.
0b0001   Adds BFC, BF1, SBFX, and UBFX.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]
Indicates the implemented Bit Counting instructions. Defined values are:
0b0000   None implemented.
0b0001   Adds CLZ.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]
Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:
0b0000   None implemented.
0b0001   Adds SWP and SWPB.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

Accessing ID_ISAR0_EL1

D17.2.75  ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers on page D17-5551.*

**Configurations**

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

**Attributes**

ID_ISAR1_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>Jazelle, bits [31:28]</td>
<td>Indicates the implemented Jazelle extension instructions. Defined values are:</td>
</tr>
<tr>
<td>0b0000</td>
<td>No support for Jazelle.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.</td>
</tr>
<tr>
<td>All other values are reserved.</td>
<td></td>
</tr>
<tr>
<td>In Armv8-A, the only permitted value is 0b0001.</td>
<td></td>
</tr>
<tr>
<td>Interwork, bits [27:24]</td>
<td>Indicates the implemented Interworking instructions. Defined values are:</td>
</tr>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BX instruction, and the T bit in the PSR.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.</td>
</tr>
<tr>
<td>All other values are reserved.</td>
<td></td>
</tr>
<tr>
<td>In Armv8-A, the only permitted value is 0b0011.</td>
<td></td>
</tr>
</tbody>
</table>
Immediate, bits [23:20]
Indicates the implemented data-processing instructions with long immediates. Defined values are:

- **0b0000** None implemented.
- **0b0001** Adds:
  - The MOVT instruction.
  - The MOV instruction encodings with zero-extended 16-bit immediates.
  - The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

IfThen, bits [19:16]
Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

- **0b0000** None implemented.
- **0b0001** Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

Extend, bits [15:12]
Indicates the implemented Extend instructions. Defined values are:

- **0b0000** No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
- **0b0001** Adds the SXTB, SXTH, UXTB, and UXTH instructions.
- **0b0100** As for **0b0001**, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is **0b0100**.

Except_AR, bits [11:8]
Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

- **0b0000** None implemented.
- **0b0001** Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

Except, bits [7:4]
Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

- **0b0000** Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
- **0b0001** Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

Endian, bits [3:0]
Indicates the implemented Endian instructions. Defined values are:

- **0b0000** None implemented.
0b0001  Adds the SETEND instruction, and the E bit in the PSRs.
All other values are reserved.
In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

Accessing ID_ISAR1_EL1
Accesses to this register use the following encodings in the System register encoding space:

|MRS <Xt>, ID_ISAR1_EL1|
|---|---|---|---|---|---|
|   |   |   |   |   |
|op0| op1| CRn| CRm| op2|
|0b1| 0b00| 0b0000| 0b0010| 0b001|

      X[t, 64] = ID_ISAR1_EL1;
  elsif PSTATE_EL == EL2 then
    X[t, 64] = ID_ISAR1_EL1;
  elsif PSTATE_EL == EL3 then
    X[t, 64] = ID_ISAR1_EL1;
D17.2.76 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0].

**Attributes**

ID_ISAR2_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>Position</th>
<th>Field</th>

</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

- 0b0000: None implemented.
- 0b0001: Adds the REV, REV16, and REVSH instructions.
- 0b0010: As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

- 0b0000: None implemented.
- 0b0001: Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.
MultU, bits [23:20]
Indicates the implemented advanced unsigned Multiply instructions. Defined values are:
- 0b0000: None implemented.
- 0b0001: Adds the UMULL and UMLAL instructions.
- 0b0010: As for 0b0001, and adds the UMAAL instruction.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0010.

MultS, bits [19:16]
Indicates the implemented advanced signed Multiply instructions. Defined values are:
- 0b0000: None implemented.
- 0b0001: Adds the SMULL and SMLAL instructions.
- 0b0010: As for 0b0001, and adds the SMLAB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
- 0b0011: As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLS, SMMLSR, SMMLUL, SMMLUR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.

Mult, bits [15:12]
Indicates the implemented additional Multiply instructions. Defined values are:
- 0b0000: No additional instructions implemented. This means only MUL is implemented.
- 0b0001: Adds the MLA instruction.
- 0b0010: As for 0b0001, and adds the MLS instruction.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]
Indicates the support for interruptible multi-access instructions. Defined values are:
- 0b0000: No support. This means the LDM and STM instructions are not interruptible.
- 0b0001: LDM and STM instructions are restartable.
- 0b0010: LDM and STM instructions are continuatable.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

MemHint, bits [7:4]
Indicates the implemented Memory Hint instructions. Defined values are:
- 0b0000: None implemented.
- 0b0001: Adds the PLD instruction.
- 0b0010: Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
- 0b0011: As for 0b0001 (or 0b0010), and adds the PLI instruction.
- 0b0100: As for 0b0011, and adds the PLDW instruction.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0010.
LoadStore, bits [3:0]
Indicates the implemented additional load/store instructions. Defined values are:

- 0b0000: No additional load/store instructions implemented.
- 0b0001: Adds the LDRD and STRD instructions.
- 0b0010: As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0010.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

Accessing ID_ISAR2_EL1
Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS } \langle X_t \rangle, \text{ ID_ISAR2_EL1} \\
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b000 & 0b0000 & 0b0010 & 0b010
\end{array}
\]

if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNEDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);

elsif PSTATE.EL == EL3 then
  \text{X}[t, 64] = ID_ISAR2_EL1;
D17.2.77 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

**Attributes**

ID_ISAR3_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>28</td>
</tr>
<tr>
<td>27</td>

<td>8</td>
<td>7</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**RES0**

Reserved, 0.

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:

- 0b0000 None implemented. This means there are no NOP instructions that do not have any register dependencies.
- 0b0001 Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.
T32Copy, bits [23:20]
Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

0b0000  Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

0b0001  Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]
Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

0b0000  None implemented.

0b0001  Adds the TBB and TBH instructions.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]
Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

0b0000  If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.

0b0001  If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.

0b0010  If SynchPrim_frac == 0b0001, as for 0b0001, and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.
In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]
Indicates the implemented SVC instructions. Defined values are:

0b0000  Not implemented.

0b0001  Adds the SVC instruction.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]
Indicates the implemented SIMD instructions. Defined values are:

0b0000  None implemented.

0b0001  As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, QADD16, QADD8, QASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHASB16, UHASB8, UHASX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.
The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

**Saturate, bits [3:0]**

Indicates the implemented Saturate instructions. Defined values are:
- 0b0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
- 0b0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs. All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Otherwise:**

![Diagram](image-url)

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing ID_ISAR3_EL1**

  X[t, 64] = ID_ISAR3_EL1;
### D17.2.78 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state. Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

**Attributes**

ID_ISAR4_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

#### Bits [63:32]

Reserved, RES0.

#### SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

- **0b0000**: SWP or SWPB instructions not implemented.
- **0b0001**: SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is **0b0000**.

In Armv8-A, the only permitted value is **0b0000**.

#### PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

- **0b0000**: None implemented.
- **0b0001**: Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is **0b0000**.
**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

- **0b0000**  
  If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0001, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.

- **0b0011**  
  If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

- **0b0000**  
  None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.

- **0b0001**  
  Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

- **0b0000**  
  None implemented.

- **0b0001**  
  Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

- **0b0000**  
  Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.

- **0b0001**  
  Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:

- **0b0000**  
  Nonzero shifts supported only in MOV and shift instructions.

- **0b0001**  
  Adds support for shifts of loads and stores over the range LSL 0-3.

- **0b0011**  
  As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.

- **0b100**  
  As for 0b011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.
Unpriv, bits [3:0]
Indicates the implemented unprivileged instructions. Defined values are:

- 0b0000: None implemented. No T variant instructions are implemented.
- 0b0001: Adds the LDRBT, LDRT, STRBT, and STRT instructions.
- 0b0010: As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.
All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

    elsif PSTATE.EL == EL3 then
        X[t, 64] = ID_ISAR4_EL1;
```
D17.2.79 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

**Attributes**

ID_ISAR5_EL1 is a 64-bit register.

</table>

**Bits [63:32]**

Reserved, RES0.

**VCMA, bits [31:28]**

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

- **0b0000**: The VCMLA and VCADD instructions are not implemented in AArch32.
- **0b0001**: The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

**FEAT_FCMA** implements the functionality identified by **0b0001**.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is **0b0000**.

From Armv8.3, the only permitted value is **0b0001**.

**RDM, bits [27:24]**

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

- **0b0000**: No VQRDMLAH and VQRDMLSH instructions implemented.
- **0b0001**: VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

**FEAT_RDM** implements the functionality identified by the value **0b0001**.

In Armv8.0, the only permitted value is **0b0000**.

From Armv8.1, the only permitted value is **0b0001**.
Bits [23:20]
Reserved, RES0.

CRC32, bits [19:16]
Indicates whether the CRC32 instructions are implemented in AArch32 state.

- **0b0000**: No CRC32 instructions implemented.
- **0b0001**: CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.
From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]
Indicates whether the SHA2 instructions are implemented in AArch32 state.

- **0b0000**: No SHA2 instructions implemented.
- **0b0001**: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]
Indicates whether the SHA1 instructions are implemented in AArch32 state.

- **0b0000**: No SHA1 instructions implemented.
- **0b0001**: SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]
Indicates whether the AES instructions are implemented in AArch32 state.

- **0b0000**: No AES instructions implemented.
- **0b0001**: AESE, AESD, AESMC, and AESIMC implemented.
- **0b0010**: As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]
Indicates whether the SEVL instruction is implemented in AArch32 state.

- **0b0000**: SEVL is implemented as a NOP.
- **0b0001**: SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.
Otherwise:

Bits [63:0]

D17.2.80 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_ISAR6_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

**Bits [63:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

0b0000  Int8 matrix multiplication instructions are not implemented.

0b0001  VSMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

**BF16, bits [23:20]**

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

0b0000  BFloat16 instructions are not implemented.

0b0001  VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMMLA instructions with BFloat16 operand or result types are implemented.

All other values are reserved.

**FEAT-AA32BF16** implements the functionality identified by 0b0001.
**SPECRES, bits [19:16]**
Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:
- 0b0000  Prediction invalidation instructions are not implemented.
- 0b0001  CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.
All other values are reserved.
**FEAT_SPECRES** implements the functionality identified by 0b0001.
From Armv8.5, the only permitted value is 0b0001.

**SB, bits [15:12]**
Indicates support for the SB instruction in AArch32 state. Defined values are:
- 0b0000  SB instruction is not implemented.
- 0b0001  SB instruction is implemented.
All other values are reserved.
**FEAT_SB** implements the functionality identified by 0b0001.
From Armv8.5, the only permitted value is 0b0001.

**FHM, bits [11:8]**
Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:
- 0b0000  VFMAL and VMFSL instructions are not implemented.
- 0b0001  VFMAL and VMFSL instructions are implemented.
All other values are reserved.
**FEAT_FHM** implements the functionality identified by 0b0001.
From Armv8.2, the permitted values are 0b0000 and 0b0001.

**DP, bits [7:4]**
Indicates support for dot product instructions in AArch32 state. Defined values are:
- 0b0000  Dot product instructions are not implemented.
- 0b0001  VUDOT and VSDOT instructions are implemented.
All other values are reserved.
**FEAT_DotProd** implements the functionality identified by 0b0001.
In Armv8.2, the permitted values are 0b0000 and 0b0001.
From Armv8.4, the only permitted value is 0b0001.

**JSCVT, bits [3:0]**
Indicates support for the VJCVT instruction in AArch32 state. Defined values are:
- 0b0000  The VJCVT instruction is not implemented.
- 0b0001  The VJCVT instruction is implemented.
All other values are reserved.
**FEAT_JSCVT** implements the functionality identified by 0b0001.
In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.
From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.
From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

D17.2.81 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

**Attributes**

ID_MMFR0_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>31</td>

</tr>
<tr>
<td>3</td>
<td>VMSA</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

- 0b0000 Implemented as Non-cacheable.
- 0b0001 Implemented with hardware coherency support.
- 0b1111 Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- 0b0000 None supported.
0b0001  Support for Auxiliary Control Register only.
0b0010  Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.
From Armv8 the only permitted value is 0b0010.

--- Note ---
Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]
Indicates support for TCMs and associated DMAs. Defined values are:
0b0000  Not supported.
0b0001  Support is IMPLEMENTATION DEFINED.
0b0010  Support for TCM only, Armv6 implementation.
0b0011  Support for TCM and DMA, Armv6 implementation.
All other values are reserved.
In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]
Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:
0b0000  One level of shareability implemented.
0b0001  Two levels of shareability implemented.
All other values are reserved.
From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]
Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:
0b0000  Implemented as Non-cacheable.
0b0001  Implemented with hardware coherency support.
0b1111  Shareability ignored.
All other values are reserved.
From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]
Indicates support for a PMSA. Defined values are:
0b0000  Not supported.
0b0001  Support for IMPLEMENTATION DEFINED PMSA.
0b0010  Support for PMSAv6, with a Cache Type Register implemented.
0b0011  Support for PMSAv7, with support for memory subsections. Armv7-R profile.
All other values are reserved.
In Armv8-A the only permitted value is 0b0000.

VMSA, bits [3:0]
Indicates support for a VMSA. Defined values are:
0b0000  Not supported.
0b0001  Support for IMPLEMENTATION DEFINED VMSA.
0b0010  Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011  Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.

0b0100  As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.

0b0101  As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

**Otherwise:**

![Bits [63:0]

Reserved, UNKNOWN.

**Bits [63:32]**

Reserved, RES0.
In Armv8-A, the permitted values are \texttt{0b0010}, \texttt{0b0011}, and \texttt{0b0100}. For values other than \texttt{0b0000} and \texttt{0b0100} the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

\textbf{L1TstCln, bits [27:24]}

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

\begin{itemize}
\item \texttt{0b0000} None supported.
\item \texttt{0b0001} Supported Level 1 data cache test and clean operations are:
  \begin{itemize}
  \item Test and clean data cache.
  \end{itemize}
\item \texttt{0b0010} As for \texttt{0b0001}, and adds:
  \begin{itemize}
  \item Test, clean, and invalidate data cache.
  \end{itemize}
\end{itemize}

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}.

\textbf{L1Uni, bits [23:20]}

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

\begin{itemize}
\item \texttt{0b0000} None supported.
\item \texttt{0b0001} Supported entire Level 1 cache operations are:
  \begin{itemize}
  \item Invalidate cache, including branch predictor if appropriate.
  \item Invalidate branch predictor, if appropriate.
  \end{itemize}
\item \texttt{0b0010} As for \texttt{0b0001}, and adds:
  \begin{itemize}
  \item Clean cache, using a recursive model that uses the cache dirty status bit.
  \item Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.
  \end{itemize}
\end{itemize}

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}.

\textbf{L1Hvd, bits [19:16]}

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

\begin{itemize}
\item \texttt{0b0000} None supported.
\item \texttt{0b0001} Supported entire Level 1 cache operations are:
  \begin{itemize}
  \item Invalidate instruction cache, including branch predictor if appropriate.
  \item Invalidate branch predictor, if appropriate.
  \end{itemize}
\item \texttt{0b0010} As for \texttt{0b0001}, and adds:
  \begin{itemize}
  \item Invalidate data cache.
  \item Invalidate data cache and instruction cache, including branch predictor if appropriate.
  \end{itemize}
\item \texttt{0b0011} As for \texttt{0b0010}, and adds:
  \begin{itemize}
  \item Clean data cache, using a recursive model that uses the cache dirty status bit.
  \item Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.
  \end{itemize}
\end{itemize}

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}. 
L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

- **0b0000**: None supported.
- **0b0001**: Supported Level 1 unified cache line maintenance operations by set/way are:
  - Clean cache line by set/way.
- **0b0010**: As for 0b0001, and adds:
  - Clean and invalidate cache line by set/way.
- **0b0011**: As for 0b0010, and adds:
  - Invalidate cache line by set/way.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

- **0b0000**: None supported.
- **0b0001**: Supported Level 1 Harvard cache line maintenance operations by set/way are:
  - Clean data cache line by set/way.
  - Clean and invalidate data cache line by set/way.
- **0b0010**: As for 0b0001, and adds:
  - Invalidate data cache line by set/way.
- **0b0011**: As for 0b0010, and adds:
  - Invalidate instruction cache line by set/way.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

- **0b0000**: None supported.
- **0b0001**: Supported Level 1 unified cache line maintenance operations by VA are:
  - Clean cache line by VA.
  - Invalidate cache line by VA.
  - Clean and invalidate cache line by VA.
- **0b0010**: As for 0b0001, and adds:
  - Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

- **0b0000**: None supported.
- **0b0001**: Supported Level 1 Harvard cache line maintenance operations by VA are:
  - Clean data cache line by VA.
  - Invalidate data cache line by VA.
• Clean and invalidate data cache line by VA.
• Clean instruction cache line by VA.

0b0010  As for 0b0001, and adds:
• Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Reserved, RES0.

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

- 0b0000  Not supported.
- 0b0001  Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

- 0b0000  Not supported.
- 0b0001  Support for WFI stalling.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

**MemBarr, bits [23:20]**

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

- 0b0000  None supported.
- 0b0001  Supported memory barrier System instructions are:
  - Data Synchronization Barrier (DSB).
0b0010  As for 0b0001, and adds:
  • Instruction Synchronization Barrier (ISB).
  • Data Memory Barrier (DMB).
All other values are reserved.
From Armv8, the only permitted value is 0b0010.
Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support
for the preferred barrier instructions.

UniTLB, bits [19:16]
Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB
implementation. Defined values are:
0b0000  Not supported.
0b0001  Supported unified TLB maintenance operations are:
  • Invalidate all entries in the TLB.
  • Invalidate TLB entry by VA.
0b0010  As for 0b0001, and adds:
  • Invalidate TLB entries by ASID match.
0b0011  As for 0b0010, and adds:
  • Invalidate instruction TLB and data TLB entries by All ASID. This is a
    shared unified TLB operation.
0b0100  As for 0b0011, and adds:
  • Invalidate Hyp mode unified TLB entry by VA.
  • Invalidate entire Non-secure PL1&0 unified TLB.
  • Invalidate entire Hyp mode unified TLB.
0b0101  As for 0b0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS,
    TLBIMVALIS, TLBIMVAL, TLBIMVAAL, TLBIMVAALH.
0b0110  As for 0b0101, and adds the following operations: TLBIPAS2IS, TLBIPAS2LIS,
    TLBIPAS2, TLBIPAS2L.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]
If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is
IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

LIHvdRng, bits [11:8]
Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations,
for a Harvard cache implementation. Defined values are:
0b0000  Not supported.
0b0001  Supported Level 1 Harvard cache maintenance range operations are:
  • Invalidate data cache range by VA.
  • Invalidate instruction cache range by VA.
  • Clean data cache range by VA.
  • Clean and invalidate data cache range by VA.
All other values are reserved.
From Armv8, the only permitted value is 0b0000.
L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

0b0000 Not supported.
0b0001 Supported Level 1 Harvard cache background fetch operations are:
  • Fetch instruction cache range by VA.
  • Fetch data cache range by VA.

All other values are reserved.
From Armv8, the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

0b0000 Not supported.
0b0001 Supported Level 1 Harvard cache foreground fetch operations are:
  • Fetch instruction cache range by VA.
  • Fetch data cache range by VA.

All other values are reserved.
From Armv8, the only permitted value is 0b0000.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

Accessing ID_MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR2_EL1

<table>

D17.2.84  ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

**Attributes**

ID_MMFR3_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supersec</td>
<td>[31:28]</td>
</tr>
<tr>
<td>CMemSz</td>
<td>[27:24]</td>
</tr>
<tr>
<td>MaintBcst</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

- 0b0000  Supersections supported.
- 0b1111  Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

- 0b0000  4GB, corresponding to a 32-bit physical address range.
- 0b0001  64GB, corresponding to a 36-bit physical address range.
- 0b0010  1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.
CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

0b0000 Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

0b0001 Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

0b0000 PAN not supported.

0b0001 PAN supported.

0b0010 PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBest, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

0b0000 Cache, TLB, and branch predictor operations only affect local structures.

0b0001 Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.

0b0010 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

0b0000 None supported.

0b0001 Supported branch predictor maintenance operations are:

• Invalidate all branch predictors.

0b0010 As for 0b0001, and adds:

• Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

0b0000 None supported.
0b0001  Supported hierarchical cache maintenance instructions by set/way are:
• Invalidate data cache by set/way.
• Clean data cache by set/way.
• Clean and invalidate data cache by set/way.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.
In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

**CMaintVA, bits [3:0]**
Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:
0b0000  None supported.
0b0001  Supported hierarchical cache maintenance operations by VA are:
• Invalidate data cache by VA.
• Clean data cache by VA.
• Clean and invalidate data cache by VA.
• Invalidate instruction cache by VA.
• Invalidate all instruction cache entries.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.
In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

**Otherwise:**

</table>

**Bits [63:32]**

Reserved, RES0.

**EVT, bits [31:28]**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

- 0b0000  HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
- 0b0001  HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.
- 0b0010  HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

**FEAT.EVT** implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented or does not support AArch32.
- 0b0010 when EL2 is implemented and supports AArch32.

**CCIDX, bits [27:24]**

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

- 0b0000  32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
- 0b0001  64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.
All other values are reserved.

**FEAT_CCIDX** implements the functionality identified by 0b0001.
From Armv8.3, the permitted values are 0b0000 and 0b0001.

**LSM, bits [23:20]**
Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR. Defined values are:
0b0000  LSMAOE and nTLSMD bits not supported.
0b0001  LSMAOE and nTLSMD bits supported.
All other values are reserved.
**FEAT_LSMAOC** implements the functionality identified by the value 0b0001.
From Armv8.2, the permitted values are 0b0000 and 0b0001.

**HPDS, bits [19:16]**
Hierarchical permission disables bits in translation tables. Defined values are:
0b0000  Disabling of hierarchical controls not supported.
0b0001  Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
0b0010  As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.
All other values are reserved.
**FEAT_AA32HPD** implements the functionality identified by the value 0b0001.
**FEAT_HPDS2** implements the functionality added by the value 0b0010.

--- Note  
The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

**CnP, bits [15:12]**
Common not Private translations. Defined values are:
0b0000  Common not Private translations not supported.
0b0001  Common not Private translations supported.
All other values are reserved.
**FEAT_TTCNP** implements the functionality identified by the value 0b0001.
From Armv8.2 the only permitted value is 0b0001.

**XNX, bits [11:8]**
Support for execute-never control distinction by Exception level at stage 2. Defined values are:
0b0000  Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001  Distinction between EL0 and EL1 execute-never control at stage 2 supported.
All other values are reserved.
**FEAT_XNX** implements the functionality identified by the value 0b0001.
When **FEAT_XNX** is implemented:
- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID.MMFR4_EL1.XNX is 0b0000 or 0b0001:
  - ID.AA64MMFR1_EL1.XNX == 1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.
AC2, bits [7:4]
Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.
Defined values are:
- 0b0000 ACTLR2 and HACTLR2 are not implemented.
- 0b0001 ACTLR2 and HACTLR2 are implemented.
All other values are reserved.
In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.
From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]
When FEAT_RAS is implemented:
Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches.
- 0b0000 The PE never generates an SError interrupt due to an External abort on a speculative read.
- 0b0001 The PE might generate an SError interrupt due to an External abort on a speculative read.
All other values are reserved.
Otherwise:
Reserved, RES0.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

Accessing ID_MMFR4_EL1
Acceses to this register use the following encodings in the System register encoding space:

</table>

**Note**

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.
DIT, bits [27:24]

Data Independent Timing. Defined values are:

0b0000  AArch32 does not guarantee constant execution time of any instructions.
0b0001  AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

0b0000  Activity Monitors Extension is not implemented.
0b0001  FEAT_AMUv1 is implemented.
0b0010  FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

0b0000  The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001  FEAT_CSV2 is implemented, but FEAT_CSV2_1p1 is not implemented.
0b0010  FEAT_CSV2_1p1 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

0b0000  Not implemented.
0b0001  T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

0b0000  Not implemented.
0b0001  Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010  Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.
State1, bits [7:4]

T32 instruction set support. Defined values are:

0b0000  T32 instruction set not implemented.
0b0001  T32 encodings before the introduction of Thumb-2 technology implemented:
        •  All instructions are 16-bit.
        •  A BL or BLX is a pair of 16-bit instructions.
        •  32-bit instructions other than BL and BLX cannot be encoded.
0b0011  T32 encodings after the introduction of Thumb-2 technology implemented, for all
        16-bit and 32-bit T32 basic instructions.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

0b0000  A32 instruction set not implemented.
0b0001  A32 instruction set implemented.

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

Accessing ID_PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b0000 & 0b0001 & 0b000 \\
\hline
\end{array}
\]

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18); \
        else
            AArch64.SystemAccessTrap(EL1, 0x18); \
        end
    else
        UNDEFINED; \
    end
elsif PSTATE.EL == EL1 then

elsif PSTATE_EL == EL3 then
  X[t, 64] = ID_PFR0_EL1;
### ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

**Attributes**

ID_PFR1_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>

<td>0b0000</td>
<td>when EL2 is implemented.</td>
</tr>
</tbody>
</table>
• 0b0001 when EL2 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

——— Note ————

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions. Defined values are:

0b0000 No Security Extensions are implemented.
0b0001 The following Security Extensions are implemented:
  • The VBAR register.
  • The TTBCR.PD0 and TTBCR.PD1 bits.
0b0010 As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:
• 0b0000 when EL3 is implemented.
• 0b0001 or 0b0010 when EL3 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:
0b0000 Generic Timer is not implemented.
0b0001 Generic Timer is implemented.
0b0010 Generic Timer is implemented, and also includes support for CNTHCTL.EVTNTIS and CNTKCTL.EVTNTIS fields, and CNTPCNTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.
From Armv8.6, the only permitted value is 0b0010.

Virtualization, bits [15:12]

Virtualization support. Defined values are:
0b0000 EL2, Hyp mode, and the HVC instruction not implemented.
0b0001 EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:
• 0b0000 when EL2 is not implemented.
• 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.
If EL1 cannot use AArch32 then this field has the value 0b0000.
Note
The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]
M-profile programmers' model support. Defined values are:
0b0000 Not supported.
0b0010 Support for two-stack programmers' model.
All other values are reserved.
In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]
Security support. Defined values are:
0b0000 EL3, Monitor mode, and the SMC instruction not implemented.
0b0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010 As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.
All other values are reserved.
In Armv8-A, the permitted values are:
• 0b0000 when EL3 is not implemented.
• 0b0001 when EL3 is implemented.
In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.
If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]
Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:
0b0000 Not supported.
0b0001 Supported.
All other values are reserved.
In Armv8-A, the permitted values are 0b0001 and 0b0000.
If EL1 cannot use AArch32 then this field has the value 0b0000.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

D17.2.89 ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

**Attributes**

ID_PFR2_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
<th>Value</th>
<th>Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:12]</td>
<td>Reserved, RES0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>[11:8]</td>
<td>RAS_frac</td>
<td></td>
<td></td>
</tr>
<tr>
<td>[7:4]</td>
<td>SSBS</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:12]**

Reserved, RES0.

**RAS_frac, bits [11:8]**

RAS Extension fractional field. Defined values are:

- **0b0000** If ID_PFR0_EL1.RAS == 0b0001, RAS Extension implemented.
- **0b0001** If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers.
  
  Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.

**SSBS, bits [7:4]**

Speculative Store Bypassing controls in AArch64 state. Defined values are:

- **0b0000** AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
- **0b0001** AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.
CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

0b0000  This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.

0b0001  Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR2_EL1

elsif PSTATE_EL == EL3 then
X[t, 64] = ID_PPR2_EL1;
D17.2.90 IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

**Purpose**
Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configurations**
AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].
This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.
If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

**Attributes**
IFSR32_EL2 is a 64-bit register.

**Field descriptions**

*When TTBCR.EAE == 0:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-17</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>
| 16   | FnV, bit [16] FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.  
0b0  IFAR is valid.  
0b1  IFAR is not valid, and holds an UNKNOWN value.  
This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.  
The reset behavior of this field is:  
• On a Warm reset, this field resets to an architecturally UNKNOWN value.  
| 15-13 | Reserved, RES0 |
| 12   | Ext, bit [12] External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.  
In an implementation that does not provide any classification of External aborts, this bit is RES0.  
For aborts other than External aborts this bit always returns 0.  
| 11-0  | Reserved, RES0 |
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally unknown value.

**Bit [11]**

Reserved, RES0.

**FS, bits [10, 3:0]**

- 0b00001: PC alignment fault.
- 0b00010: Debug exception.
- 0b00011: Access flag fault, level 1.
- 0b00101: Translation fault, level 1.
- 0b00110: Access flag fault, level 2.
- 0b00111: Translation fault, level 2.
- 0b01000: Synchronous External abort, not on translation table walk.
- 0b01001: Domain fault, level 1.
- 0b01011: Domain fault, level 2.
- 0b01100: Synchronous External abort, on translation table walk, level 1.
- 0b01101: Permission fault, level 1.
- 0b01110: Synchronous External abort, on translation table walk, level 2.
- 0b01111: Permission fault, level 2.
- 0b10000: TLB conflict abort.
- 0b10100: IMPLEMENTATION DEFINED fault (Lockdown fault).
- 0b11001: When FEAT_RAS is not implemented:
  Synchronous parity or ECC error on memory access, not on translation table walk.
- 0b11100: When FEAT_RAS is not implemented:
  Synchronous parity or ECC error on translation table walk, level 1.
- 0b11110: When FEAT_RAS is not implemented:
  Synchronous parity or ECC error on translation table walk, level 2.

All other values are reserved.

For more information about the lookup level associated with a fault, see The level associated with MMU faults on a Short-descriptor translation table lookup on page G5-9257.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally unknown value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

- 0b0: Using the Short-descriptor translation table formats.
- 0b1: Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally unknown value.
Bits [8:4]
Reserved, RES0.

When \texttt{TTBCR.EAE} == 1:

Bits [63:17]
Reserved, RES0.

\textbf{FnV, bit [16]}

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

\begin{itemize}
  \item \texttt{0b0} IFAR is valid.
  \item \texttt{0b1} IFAR is not valid, and holds an \texttt{UNKNOWN} value.
\end{itemize}

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

\begin{itemize}
  \item On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
\end{itemize}

Bits [15:13]
Reserved, RES0.

\textbf{ExT, bit [12]}

External abort type. This bit can be used to provide an \texttt{IMPLEMENTATION DEFINED} classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

\begin{itemize}
  \item On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
\end{itemize}

Bits [11:10]
Reserved, RES0.

\textbf{LPAE, bit [9]}

On taking a Data Abort exception, this bit is set as follows:

\begin{itemize}
  \item \texttt{0b0} Using the Short-descriptor translation table formats.
  \item \texttt{0b1} Using the Long-descriptor translation table formats.
\end{itemize}

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

\begin{itemize}
  \item On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
\end{itemize}

Bits [8:6]
Reserved, RES0.
STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

- **0b000000** Address size fault in translation table base register.
- **0b000001** Address size fault, level 1.
- **0b000010** Address size fault, level 2.
- **0b000011** Address size fault, level 3.
- **0b000101** Translation fault, level 1.
- **0b000110** Translation fault, level 2.
- **0b000111** Translation fault, level 3.
- **0b001001** Access flag fault, level 1.
- **0b001010** Access flag fault, level 2.
- **0b001011** Access flag fault, level 3.
- **0b001101** Permission fault, level 1.
- **0b001110** Permission fault, level 2.
- **0b001111** Permission fault, level 3.
- **0b010000** Synchronous External abort, not on translation table walk.
- **0b010101** Synchronous External abort on translation table walk, level 1.
- **0b010110** Synchronous External abort on translation table walk, level 2.
- **0b010111** Synchronous External abort on translation table walk, level 3.
- **0b011000** When FEAT_RAS is not implemented:
  - Synchronous parity or ECC error on memory access, not on translation table walk.
- **0b011101** When FEAT_RAS is not implemented:
  - Synchronous parity or ECC error on memory access on translation table walk, level 1.
- **0b011110** When FEAT_RAS is not implemented:
  - Synchronous parity or ECC error on memory access on translation table walk, level 2.
- **0b011111** When FEAT_RAS is not implemented:
  - Synchronous parity or ECC error on memory access on translation table walk, level 3.
- **0b100001** PC alignment fault.
- **0b100010** Debug exception.
- **0b110000** TLB conflict abort.

All other values are reserved.

When FEAT_RAS is implemented, **0b011000**, **0b011101**, **0b011110**, and **0b011111** are reserved.

For more information about the lookup level associated with a fault, see *The level associated with MMU faults on a Long-descriptor translation table lookup* on page G5-9259.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing IFSR32_EL2**

Accesses to this register use the following encodings in the System register encoding space:
**MRS <Xt>, IFSR32_EL2**

if PSTATE.EL == EL0 then

D17.2.91 ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when SCR_EL3.EEL2 == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when SCR_EL3.EEL2 == 0b1:

- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configurations**

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

**Attributes**

ISR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:11</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>10</td>
<td>IS, bit</td>
</tr>
<tr>
<td>9</td>
<td>FS, bit</td>
</tr>
</tbody>
</table>

**When FEAT_NMI is implemented:**

- ISR_EL1.I bit shows the pending status of the virtualIRQ, FIQ, and SError.
- ISR_EL1.F bit shows the pending status of the virtual IRQ, FIQ, and SError.
- ISR_EL1.A bit shows the pending status of the virtual IRQ, FIQ, and SError.

**Otherwise:**

- Reserved, RES0.
A, bit [8]
SError interrupt pending bit. Indicates whether an SError interrupt is pending.
0b0 No pending SError.
0b1 An SError interrupt is pending.
If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]
IRQ pending bit. Indicates whether an IRQ interrupt is pending.
0b0 No pending IRQ.
0b1 An IRQ interrupt is pending.

——— Note ————
This bit indicates the presence of a pending IRQ interrupt regardless of whether the interrupt has Superpriority.

F, bit [6]
FIQ pending bit. Indicates whether an FIQ interrupt is pending.
0b0 No pending FIQ.
0b1 An FIQ interrupt is pending.

——— Note ————
This bit indicates the presence of a pending FIQ interrupt regardless of whether the interrupt has Superpriority.

Bits [5:0]
Reserved, RES0.

Accessing ISR_EL1
Accesses to this register use the following encodings in the System register encoding space:

\[
\begin{array}{cccc}
\text{MRS <Xt>, ISR_EL1} \\
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b000 & 0b1100 & 0b0001 & 0b000 \\
\end{array}
\]

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFCRTR_EL2.ISR_EL1 == '1' then

  else
    X[t, 64] = ISR_EL1;
elsif PSTATE.EL == EL2 then
  X[t, 64] = ISR_EL1;
elsif PSTATE.EL == EL3 then
  X[t, 64] = ISR_EL1;
D17.2.92  LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

**Purpose**

Enables and disables LORegions, and selects the current LORegion descriptor.

**Configurations**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

**Attributes**

LORC_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1.

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log2(Number of LORegion descriptors supported by the implementation).

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

0b0  Disabled. Memory accesses do not match any LORegions.

0b1  Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

• On a Warm reset, this field resets to 0.

**Accessing LORC_EL1**

D17.2.93 LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

**Purpose**

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configurations**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is res0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LOREA_EL1 is a 64-bit register.

**Field descriptions**

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, res0.

**EA[51:48], bits [51:48]**

*When FEAT_LPA is implemented:*

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, res0.

**EA[47:16], bits [47:16]**

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are res0.

When FEAT_LPA is implemented and 52-bit addresses are in use, EA[51:48] form bits [51:48] of the end physical address of the LORegion. Otherwise, when 52-bit addresses are not in use, EA[51:48] is res0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [15:0]**

Reserved, res0.
Accessing LOREA_EL1

D17.2.95  **LORN_EL1, LORegion Number (EL1)**

The LORN_EL1 characteristics are:

**Purpose**

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configurations**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are **UNDEFINED**.

This register is **RES0** if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LORN_EL1 is a 64-bit register.

**Field descriptions**

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:8]**

Reserved, **RES0**.

**Num, bits [7:0]**

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are **RES0**, where N is (Log2(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing LORN_EL1**

Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, LORN_EL1

D17.2.96  LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

**Purpose**

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

**Configurations**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:
- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LORSA_EL1 is a 64-bit register.

**Field descriptions**

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**SA, bits [51:16]**

*SA encoding when FEAT_LPA is implemented*

**SA, bits [35:0]**

Bits [51:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
SA encoding when FEAT_LPA is not implemented

Bits [35:32]
  Reserved, RES0.

SA, bits [31:0]
  Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.
  Bits[15:0] of this address are 0x0000.
  For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.
  The reset behavior of this field is:
    • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:1]
  Reserved, RES0.

Valid, bit [0]
  Indicates whether the current LORegion descriptor is enabled.
  0b0   LORegion descriptor is disabled.
  0b1   LORegion descriptor is enabled.
  The reset behavior of this field is:
    • On a Warm reset, this field resets to 0.

D17.2.97 MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

**Configurations**

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.
AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.
AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.
AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

**Attributes**

MAIR_EL1 is a 64-bit register.

**Field descriptions**

MAIR_EL1 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 7 to 0**

Attr is encoded as follows:

<table>
<thead>
<tr>
<th>Attr</th>

<tr>
<td>0b1000</td>
<td>Device-nGRE memory</td>
</tr>
<tr>
<td>0b1001</td>
<td>Device-GRE memory</td>
</tr>
</tbody>
</table>

'oooo' is encoded as follows:

<table>
<thead>
<tr>
<th>'oooo'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b0001</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>0b0101</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>0b1000</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>0b1001</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<table>
<thead>
<tr>
<th>'iiii'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b0001</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b0101</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b1000</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b1001</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>
R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.
The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, MAIR_EL1**

<table>
<thead>
<tr>

D17.2.98 MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

**Configurations**

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MAIR_EL2 is a 64-bit register.

**Field descriptions**

MAIR_EL2 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 7 to 0**

Attr is encoded as follows:

<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000dd00</td>
<td>Device memory. See encoding of 'dd' for the type of Device memory.</td>
</tr>

<tr>
<td>0b10RW</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>
R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iii' fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing MAIR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 is not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, MAIR_EL2**

```plaintext
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  X[t, 64] = MAIR_EL2;
elsif PSTATE.EL == EL3 then
  X[t, 64] = MAIR_EL2;
```

**MSR MAIR_EL2, <Xt>**

```plaintext
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  MAIR_EL2 = X[t, 64];
```
elsif PSTATE.EL == EL3
    MAIR_EL2 = X[t, 64];

D17.2.99 MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a
Long-descriptor format translation table entry for stage 1 translations at EL3.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to MAIR_EL3
are UNDEFINED.

**Attributes**

MAIR_EL3 is a 64-bit register.

**Field descriptions**

MAIR_EL3 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 7 to 0**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation
table entry, where AttrIndx[2:0] gives the value of <n> in Attr<\n>.

Attr is encoded as follows:

<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000dd00</td>
<td>Device memory. See encoding of 'dd' for the type of Device memory.</td>
</tr>
<tr>
<td>0b0000dd01</td>
<td>If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b0000dd1x</td>
<td>UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b00000000</td>
<td>Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.</td>
</tr>
<tr>
<td>0b10100000</td>
<td>If FEAT_XS is implemented: Normal Inner Write-back, Outer Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b11110000</td>
<td>If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Non-transient memory. Otherwise, UNPREDICTABLE.</td>
</tr>
<tr>
<td>0bxxxx8000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)</td>
<td>UNPREDICTABLE.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxx8000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)</td>
<td>UNPREDICTABLE.</td>
</tr>
</tbody>
</table>
'dd' is encoded as follows:

<table>
<thead>
<tr>
<th>dd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b01</td>
<td>Device-nGnRE memory</td>
</tr>
<tr>
<td>0b10</td>
<td>Device-nGRE memory</td>
</tr>
<tr>
<td>0b11</td>
<td>Device-GRE memory</td>
</tr>
</tbody>
</table>

'o000' is encoded as follows:

<table>
<thead>
<tr>
<th>'o000'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>0b01RW</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

'R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iii' is encoded as follows:

<table>
<thead>
<tr>
<th>'iii'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

'R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'o000' and 'iii' fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing MAIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

D17.2.100 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configurations**

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

**Attributes**

MIDR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

- 0x00: Reserved for software use.
- 0x41: Arm Limited.
- 0x42: Broadcom Corporation.
- 0x43: Cavium Inc.
- 0x44: Digital Equipment Corporation.
- 0x46: Fujitsu Ltd.
- 0x49: Infineon Technologies AG.
- 0x40: Motorola or Freescale Semiconductor Inc.
- 0x4E: NVIDIA Corporation.
- 0x50: Applied Micro Circuits Corporation.
- 0x51: Qualcomm Inc.
- 0x56: Marvell International Ltd.
- 0x69: Intel Corporation.
- 0xC0: Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Architecture, bits [19:16]

Architecture version. Defined values are:

- 0b0001  Armv4.
- 0b0010  Armv4T.
- 0b0011  Armv5 (obsolete).
- 0b0100  Armv5T.
- 0b0101  Armv5TE.
- 0b0110  Armv5TEJ.
- 0b0111  Armv6.
- 0b1111  Architectural features are individually identified in the ID_* registers.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS} \ <Xt>, \ \text{MIDR}\_\text{EL1}
\]

<table>
<thead>
<tr>
<th>op0</th>

### D17.2.101 MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configurations**

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MPIDR[31:0].

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-40</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>Reserved, RES1.</td>
</tr>
<tr>
<td>30</td>
<td>U, bit [30]</td>
</tr>
<tr>
<td>29-25</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>24</td>
<td>MT, bit [24]</td>
</tr>
</tbody>
</table>

- **Aff3, bits [39:32]**
  
  Affinity level 3. See the description of Aff0 for more information.
  
  Aff3 is not supported in AArch32 state.

- **Bit [31]**
  
  Reserved, RES1.

- **U, bit [30]**
  
  Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.
  
  0b0 Processor is part of a multiprocessor system.
  
  0b1 Processor is part of a uniprocessor system.

- **Bits [29:25]**
  
  Reserved, RES0.

- **MT, bit [24]**
  
  Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.
  
  0b0 Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
  
  0b1 Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.
Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing MPIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

\[ MRS <X>, MPIDR_EL1 \]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>

```

D17.2.102 MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR0_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

![Register Diagram]

**Bits [63:32]**

Reserved, RES0.

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

- **0b0000**: Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
- **0b0001**: All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are **0b0000** and **0b0001**.

**FPShVec, bits [27:24]**

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

- **0b0000**: Short vectors not supported.
- **0b0001**: Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is **0b0000**.
FPSqrt, bits [23:20]
Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:
0b0000 Not supported in hardware.
0b0001 Supported.
All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0001.
The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]
Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:
0b0000 Not supported in hardware.
0b0001 Supported.
All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0001.
The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]
Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:
0b0000 Not supported.
0b0001 Supported.
All other values are reserved.
A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]
Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:
0b0000 Not supported in hardware.
0b0001 Supported, VFPv2.
0b0010 Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.
All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0010.
A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:
• VSQRT.F64 is only available if the Square root field is 0b0001.
• VDIV.F64 is only available if the Divide field is 0b0001.
• Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.
FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

- 0b0000: Not supported in hardware.
- 0b0001: Supported, VFPv2.
- 0b0010: Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

- 0b0000: The implementation has no Advanced SIMD and floating-point support.
- 0b0001: The implementation includes floating-point support with 16 x 64-bit registers.
- 0b0010: The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR0_EL1

D17.2.103 MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR1[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR1_EL1 is a 64-bit register.

**Field descriptions**

*When AArch32 is supported:*

</tbody>
</table>

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

- 0b0000 Not implemented.
- 0b0001 Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.
SIMDInt, bits [15:12]
Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

0b0000  Not implemented.
0b0001  Implemented.
All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]
Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

0b0000  Not implemented.
0b0001  Implemented.
All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPDNaN, bits [7:4]
Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

0b0000  Not implemented, or hardware supports only the Default NaN mode.
0b0001  Hardware supports propagation of NaN values.
All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPFtZ, bits [3:0]
Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

0b0000  Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001  Hardware supports full denormalized number arithmetic.
All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

Bits [63:0]
Reserved, UNKNOWN.

D17.2.104 MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR2_EL1 is a 64-bit register.

**Field descriptions**

    X[t, 64] = MVFR2\_EL1;
D17.2.105 PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configurations**

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

**Attributes**

PAR_EL1 is a 64-bit register.

**Field descriptions**

*When PAR_EL1.F == 0:*

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.[ATTR, SH] fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<\text{n}> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

---

**Note**

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [55:52]
Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:
Extension to PA[47:12]. For more information, see PA[47:12].
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PA[47:12], bits [47:12]
Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].
When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.
For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]

When FEAT_RME is implemented:
Reports the NSE attribute for a translation table entry from the EL3 translation regime.
For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.
For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

Otherwise:
Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

When FEAT_RME is implemented:
Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.
For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

<table>
<thead>
<tr>
<th>NSE</th>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>00</td>
<td>Secure.</td>
</tr>
<tr>
<td>00</td>
<td>01</td>
<td>Non-secure.</td>
</tr>
<tr>
<td>01</td>
<td>00</td>
<td>Root.</td>
</tr>
<tr>
<td>01</td>
<td>01</td>
<td>Realm.</td>
</tr>
</tbody>
</table>
For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH, bits [8:7]**

Shareability attribute, for the returned output address.

- **0b00** Non-shareable.
- **0b10** Outer Shareable.
- **0b11** Inner Shareable.

The value 0b01 is reserved.

**Note**

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:1]**

Reserved, RES0.
F, bit [0]
Indicates whether the instruction performed a successful address translation.

0b0 Address translation completed successfully.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

When PAR_EL1.F == 1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]
IMPLEMENTATION DEFINED.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]
IMPLEMENTATION DEFINED.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]
IMPLEMENTATION DEFINED.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]
Reserved, RES0.

Bit [11]
Reserved, RES1.

Bit [10]
Reserved, RES0.

S, bit [9]
Indicates the translation stage at which the translation aborted:

0b0 Translation aborted because of a fault in the stage 1 translation.
0b1 Translation aborted because of a fault in the stage 2 translation.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

- 0b000000  Address size fault, level 0 of translation or translation table base register.
- 0b000001  Address size fault, level 1.
- 0b000010  Address size fault, level 2.
- 0b000011  Address size fault, level 3.
- 0b000100  Translation fault, level 0.
- 0b000101  Translation fault, level 1.
- 0b000110  Translation fault, level 2.
- 0b000111  Translation fault, level 3.
- 0b001000  Access flag fault, level 0.
- 0b001001  Access flag fault, level 1.
- 0b001010  Access flag fault, level 2.
- 0b001011  Access flag fault, level 3.
- 0b001100  When FEAT_LPA2 is implemented: Access flag fault, level 0.
- 0b001101  When FEAT_LPA2 is implemented: Permission fault, level 0.
- 0b001110  Permission fault, level 2.
- 0b001111  Permission fault, level 3.
- 0b010000  When FEAT_LPA2 is implemented: Synchronous External abort on translation table walk or hardware update of translation table, level -1.
- 0b010001  Synchronous External abort on translation table walk or hardware update of translation table, level 0.
- 0b010010  Synchronous External abort on translation table walk or hardware update of translation table, level 1.
- 0b010011  Synchronous External abort on translation table walk or hardware update of translation table, level 2.
- 0b010100  Synchronous External abort on translation table walk or hardware update of translation table, level 3.
- 0b010101  Synchronous External abort on translation table walk or hardware update of translation table, level -1.
- 0b010110  Synchronous External abort on translation table walk or hardware update of translation table, level 0.
- 0b010111  Synchronous External abort on translation table walk or hardware update of translation table, level 1.
- 0b011000  When FEAT_LPA2 is implemented and FEAT_RAS is not implemented: Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.
- 0b011001  When FEAT_RAS is not implemented: Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.
- 0b011010  When FEAT_RAS is not implemented:
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.

0b011110  *When FEAT_RAS is not implemented:*  
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.

0b011111  *When FEAT_RAS is not implemented:*  
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.

0b100011  *When FEAT_RME is implemented and FEAT_LPA2 is implemented:*  
Granule Protection Fault on translation table walk or hardware update of translation table, level -1.

0b100100  *When FEAT_RME is implemented:*  
Granule Protection Fault on translation table walk or hardware update of translation table, level 0.

0b100101  *When FEAT_RME is implemented:*  
Granule Protection Fault on translation table walk or hardware update of translation table, level 1.

0b100110  *When FEAT_RME is implemented:*  
Granule Protection Fault on translation table walk or hardware update of translation table, level 2.

0b100111  *When FEAT_RME is implemented:*  
Granule Protection Fault on translation table walk or hardware update of translation table, level 3.

0b101000  *When FEAT_RME is implemented:*  
Granule Protection Fault, not on translation table walk or hardware update of translation table.

0b101001  *When FEAT_LPA2 is implemented:*  
Address size fault, level -1.

0b101011  *When FEAT_LPA2 is implemented:*  
Translation fault, level -1.

0b110000  TLB conflict abort.

0b110001  *When FEAT_HAFDBS is implemented:*  
Unsupported atomic hardware update fault.

0b111101  *When EL1 is capable of using AArch32:*  
Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.

0b111110  *When EL1 is capable of using AArch32:*  
Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.

The reset behavior of this field is:
* On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

0b1  Address translation aborted.

The reset behavior of this field is:
* On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing PAR_EL1

D17.2.106 REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

**Purpose**
Provides implementation-specific minor revision information.

**Configurations**
AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register REVIDR[31:0].

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

**Attributes**
REVIDR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>

D17.2.107  **RGSR_EL1, Random Allocation Tag Seed Register.**

The RGSR_EL1 characteristics are:

**Purpose**

Random Allocation Tag Seed Register.

**Configurations**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

When **GCR_EL1.RRND==0b1**, updates to RGSR_EL1 are implementation-specific.

**Attributes**

RGSR_EL1 is a 64-bit register.

**Field descriptions**

![Field descriptions diagram]

Bits [63:24]  
Reserved, RES0.

**SEED, bits [23:8]**
Seed register used for generating values returned by RandomAllocationTag().

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]  
Reserved, RES0.

**TAG, bits [3:0]**
Tag generated by the most recent IRG instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing RGSR_EL1**

Accesses to this register use the following encodings in the System register encoding space:

D17.2.108 RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

**Purpose**
When this register is implemented:
- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configurations**
AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR_EL1 are UNDEFINED.

When EL1 is the highest implemented Exception level:
- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

**Attributes**
RMR_EL1 is a 64-bit register.

**Field descriptions**

![Field diagram]

**Bits [63:2]**
Reserved, RES0.

**RR, bit [1]**
Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**AA64, bit [0]**

*When EL1 is capable of using AArch32:*
- When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:
  - 0b0   AArch32.
  - 0b1   AArch64.

  On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.
- If EL1 can only use AArch64 state, this bit is RAO/WI.

  The reset behavior of this field is:
  - When implemented as a RW field, this field resets to 1 on a Cold reset.
Otherwise:
Reserved, RAO/WI.

Accessing RMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, RMR_EL1**

<table>

D17.2.114 RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

**Purpose**

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configurations**

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RVBAR_EL2 are UNDEFINED.

**Attributes**

RVBAR_EL2 is a 64-bit register.

**Field descriptions**

D17.2.117 SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

**Purpose**

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is Secure, Non-secure, or Realm.
- The Execution state at lower Exception levels.
- WhetherIRQ, F IQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

**Attributes**

SCR_EL3 is a 64-bit register.

**Field descriptions**

Bit [63]
Reserved, RES0.

NSE, bit [62]

*When FEAT_RME is implemented:*

This field, evaluated with SCR_EL3.NS, selects the Security state of EL2 and lower Exception levels.

For a description of the values derived by evaluating NS and NSE together, see SCR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.
Bits [61:49]
Reserved, RES0.

GPF, bit [48]

When FEAT_RME is implemented:
Controls the reporting of Granule protection faults at EL0, EL1 and EL2.

0b0 This control does not cause exceptions to be routed from EL0, EL1 or EL2 to EL3.
0b1 GPFs at EL0, EL1 and EL2 are routed to EL3 and reported as Granule Protection Check exceptions.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [47:42]
Reserved, RES0.

EnTP2, bit [41]

When FEAT_SME is implemented:
Traps instructions executed at EL2, EL1, and EL0 that access TPIDR2_EL0 to EL3. The exception is reported using ESR_ELx.EC value 0x18.

0b0 This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b1 This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TRNDR, bit [40]

When FEAT_RNG_TRAP is implemented:
Controls trapping of reads of RNDR and RNDRRS. The exception is reported using ESR_ELx.EC value 0x18.

0b0 This control does not cause RNDR and RNDRRS to be trapped.

When FEAT_RNG is implemented:
• ID_AA64ISAR0_EL1.RNDR returns the value 0b0001.
When FEAT_RNG is not implemented:
• ID_AA64ISAR0_EL1.RNDR returns the value 0b0000.
• MRS reads of RNDR and RNDRRS are UNDEFINED.

0b1 ID_AA64ISAR0_EL1.RNDR returns the value 0b0001.
Any attempt to read RNDR or RNDRRS is trapped to EL3.

When FEAT_RNG is not implemented, Arm recommends that SCR_EL3.TRNDR is initialized before entering Exception levels below EL3 and not subsequently changed.

The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [39]
Reserved, RES0.
HXEn, bit [38]

When FEAT_HCX is implemented:

Enables access to the HCRX_EL2 register at EL2 from EL3.

0b0  Accesses at EL2 to HCRX_EL2 are trapped to EL3. Indirect reads of HCRX_EL2 return 0.

0b1  This control does not cause any instructions to be trapped.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]

When FEAT_LS64_ACCDATA is implemented:

Enables access to the ACCDATA_EL1 register at EL1 and EL2.

0b0  Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.

0b1  This control does not cause accesses to ACCDATA_EL1 to be trapped.

If the HFGWTR_EL2.nACCDATA_EL1 or HFGRT_EL2.nACCDATA_EL1 traps are enabled, they take priority over this trap.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]

When FEAT_LS64_ACCDATA is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

0b0  EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1.EnAS0, or to EL2 by either HCRX_EL2.EnAS0 or SCTLR_EL2.EnAS0.

EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2.EnAS0.

EL2 execution of an ST64BV0 instruction is trapped to EL3.

0b1  This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x8000001.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

0b0  Accesses to AMEVCTVOFF0<n>_EL2 and AMEVCTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.

0b1  Accesses to AMEVCTVOFF0<n>_EL2 and AMEVCTVOFF1<n>_EL2 are not affected by this field.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TME, bit [34]**

*When FEAT_TME is implemented:*

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

- **0b0** EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED.
- **0b1** This control does not cause any instruction to be UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWEDEL, bits [33:30]**

*When FEAT_TWED is implemented:*

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWEDEn, bit [29]**

*When FEAT_TWED is implemented:*

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using an ESR_ELx.EC value of 0x01.

- **0b0** The delay for taking the trap is IMPLEMENTATION DEFINED.
- **0b1** The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ECVEn, bit [28]**

*When FEAT_ECV is implemented:*

ECV Enable. Enables access to the CNTPOFF_EL2 register.

- **0b0** EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
- **0b1** EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
D17.2 General system control registers

FGTEn, bit [27]

When FEAT_FGT is implemented:

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2, HFGITR_EL2, and HFGWTR_EL2, and controls access to those registers.

____ Note _______

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the MDCR_EL3.TDCC traps.

| 0b0 | EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled. |
| 0b1 | EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism. |

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_ELx.EC value of 0x18 and its associated ISS.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [26]

When FEAT_MTE2 is implemented:

Allocation Tag Access. Controls access to Allocation Tags, System registers for Memory tagging, and prevention of Tag checking, at EL2, EL1 and EL0.

| 0b0 | Access to Allocation Tags is prevented at EL2, EL1, and EL0. Accesses at EL1 and EL2 to GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3. Memory accesses at EL2, EL1, and EL0 are not subject to a Tag Check operation. |
| 0b1 | This control does not prevent access to Allocation Tags at EL2, EL1, and EL0. This control does not prevent Tag checking at EL2, EL1, and EL0. |

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers.

| 0b0 | Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0, SCXTNUM_EL1, or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0. |
| 0b1 | This control does not cause any accesses to be trapped, or register values to be treated as 0. |
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:22]**

Reserved, RES0.

**FIEN, bit [21]**

*When FEAT_RASv1p1 is implemented:*

Fault Injection enable. Trap accesses to the registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using an ESR_ELx.EC value of 0x18.

- **0b0** Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
- **0b1** This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NMEA, bit [20]**

*When FEAT_DoubleFault is implemented:*

Non-maskable External Aborts. When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

- **0b0** If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.
- **0b1** If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EASE, bit [19]**

*When FEAT_DoubleFault is implemented:*

External aborts to SError interrupt vector.

- **0b0** Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.
- **0b1** Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.
**EEL2, bit [18]**

*When FEAT_SEL2 is implemented:*

Secure EL2 Enable.

- **0b0**: All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are **UNDEFINED**, and those timers are disabled.
- **0b1**: All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of `ESR_EL2.EC==0x3`:
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of `ESR_EL2.EC==0x0`:
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

**Note**

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**API, bit [17]**

*When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:*

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR_ELx.EC value of `0x9`:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETTAB, LDRRAA and LDRRAB when:
  - In EL0, when HCR_EL2.TGE == 0 or HCR_EL2.E2H == 0, and the associated SCTLR_EL1.En<<M> == 1.
— In EL0, when HCR_EL2.TGE == 1 and HCR_EL2.E2H == 1, and the associated SCTLR_EL2.En<N><M> == 1.
— In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
— In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

0b0 The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.

0b1 This control does not cause any instructions to be trapped.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see Pointer authentication on page D8-5164.

—— Note ———

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SEL2 is not implemented and FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:
• PACGA.
• AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETTA, LDRAA and LDRAB when:
  — In Non-secure EL0, when HCR_EL2.TGE == 0 or HCR_EL2.E2H == 0, and the associated SCTLR_EL1.En<N><M> == 1.
  — In Non-secure EL0, when HCR_EL2.TGE == 1 and HCR_EL2.E2H == 1, and the associated SCTLR_EL2.En<N><M> == 1.
  — In Secure EL0, when the associated SCTLR_EL1.En<N><M> == 1.
  — In Secure or Non-secure EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  — In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

0b0 The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.

0b1 This control does not cause any instructions to be trapped.

—— Note ———

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:
• APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1.
• APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1.
• APGAKeyLo_EL1, and APGAKeyHi_EL1.

0b0  Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.

0b1  This control does not cause any instructions to be trapped.

For more information, see Pointer authentication on page D8-5164.

Note
If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:
Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:
• Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
  — ERRIDR_EL1, ERRSEL_EL1, ERXADDR_EL1, ERXCTRL_EL1, ERXFR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
• If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to ERXMISC2_EL1, and ERXMISC3_EL1, are trapped and reported using an ESR_ELx.EC value of 0x18.
• Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
  — ERRIDR, ERRSEL, ERXADDR, ERXADDR2, ERXCTRL, ERXCTRL2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
• If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
  — ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

0b0  This control does not cause any instructions to be trapped.

0b1  Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TLOR, bit [14]

When FEAT_LOR is implemented:
Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

0b0  This control does not cause any instructions to be trapped.

0b1  EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Otherwise:**

Reserved, RES0.

**TWE, bit [13]**

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When `FEAT_WFxT` is implemented, this trap also applies to the WFET instruction.

- **0b0** This control does not cause any instructions to be trapped.
- **0b1** Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by `SCTLR.nTWE`, `HCR.TWE`, `SCTLR_EL1.nTWE`, `SCTLR_EL2.nTWE`, or `HCR_EL2.TWE`.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

---

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

For more information about when WFE instructions can cause the PE to enter a low-power state, see `Wait for Event` on page D1-4676.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TWI, bit [12]**

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When `FEAT_WFxT` is implemented, this trap also applies to the WFIT instruction.

- **0b0** This control does not cause any instructions to be trapped.
- **0b1** Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by `SCTLR.nTWI`, `HCR.TWII`, `SCTLR_EL1.nTWI`, `SCTLR_EL2.nTWI`, or `HCR_EL2.TWII`.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

---

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

For more information about when WFI instructions can cause the PE to enter a low-power state, see `Wait for Interrupt mechanism` on page D1-4678.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
### ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

- **0b0**: Secure EL1 using AArch64 accesses to the `CNTPS.TVAL_EL1`, `CNTPS.CTL_EL1`, and `CNTPS.CV_AL_EL1` are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.

- **0b1**: This control does not cause any instructions to be trapped.

--- **Note** ---

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

### RW, bit [10]

**When EL1 is capable of using AArch32 or EL2 is capable of using AArch32:**

Execution state control for lower Exception levels.

- **0b0**: Lower levels are all AArch32.
- **0b1**: The next lower level is AArch64.
  - If EL2 is present:
    - EL2 is AArch64.
    - EL2 controls EL1 and EL0 behaviors.
  - If EL2 is not present:
    - EL1 is AArch64.
    - EL0 is determined by the Execution state described in the current process state when executing at EL0.

If AArch32 state is supported by the implementation at EL1, `SCR_EL3.NS == 1` and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, `FEAT_SEL2` is implemented and `SCR_EL3.{EEL2, NS} == {1, 0}`, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAO/WI.

### SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction execution from memory marked in the first stage of translation as being Non-secure.

- **0b0**: Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is permitted.
- **0b1**: Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is not permitted.

When `FEAT_PAN3` is implemented, it is IMPLEMENTATION DEFINED whether `SCR_EL3.SIF` is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

0b0   HVC instructions are UNDEFINED.
0b1   HVC instructions are enabled at EL3, EL2, and EL1.

--- Note ---

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

---

If EL2 is not implemented, this bit is RES0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x00.

0b0   SMC instructions are enabled at EL3, EL2 and EL1.
0b1   SMC instructions are UNDEFINED.

--- Note ---

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If HCR_EL2.TSC or HCR.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

---

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

0b0   When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3.
      In addition, when executing at EL3:
      • SError interrupts are not taken.
      • External aborts are taken to EL3.

0b1   When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see Establishing the target Exception level of an asynchronous exception on page D1-4657.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
FIQ, bit [2]

Physical FIQ Routing.

0b0  When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.
When executing at EL3, physical FIQ interrupts are not taken.

0b1  When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see Establishing the target Exception level of an asynchronous exception on page D1-4657.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

0b0  When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.
When executing at EL3, physical IRQ interrupts are not taken.

0b1  When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see Establishing the target Exception level of an asynchronous exception on page D1-4657.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]

When FEAT_RME is implemented:

Non-secure bit. This field is used in combination with SCR_EL3.NSE to select the Security state of EL2 and lower Exception levels.

<table>
<thead>
<tr>
<th>NSE</th>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Realm.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure bit.

0b0  Indicates that EL0 and EL1 are in Secure state.
When FEAT_SEL2 is implemented and SCR_EL3.EEL2 == 1, then EL2 is using AArch64 and in Secure state.

0b1  Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, SCR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE_EL == EL0 then
  UNDEFINED;
elsif PSTATE_EL == EL1 then
  UNDEFINED;
elsif PSTATE_EL == EL2 then
  UNDEFINED;
elsif PSTATE_EL == EL3 then
  X[t, 64] = SCR_EL3;

**MSR SCR_EL3, <Xt>**

<table>

elsif PSTATE_EL == EL1 then
  UNDEFINED;
elsif PSTATE_EL == EL2 then
  UNDEFINED;
elsif PSTATE_EL == EL3 then
  SCR_EL3 = X[t, 64];
D17.2.118  SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

### Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

### Configurations

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

### Attributes

SCTLR_EL1 is a 64-bit register.

### TIDCP, bit [63]

**When FEAT_TIDCP1 is implemented:**

Trap IMPLEMENTATION DEFINED functionality. When HCR_EL2.{E2H, TGE} != \{1, 1\}, traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL1.

- **0b0**  No instructions accessing the System register or System instruction spaces are trapped by this mechanism.

- **0b1**  Instructions accessing the following System register or System instruction spaces are trapped to EL1 by this mechanism:
  - In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
    - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn = {11, 15}.
IMPLEMENTATION DEFINED System registers, which are accessed using 
MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.

- In AArch32 state, EL0 MCR and MRC access to the following encodings are 
  trapped and reported using EC syndrome 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, 
    opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, 
    opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 
    == {0-7}.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to an 
  architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SPINTMASK, bit [62]
When FEAT_NMI is implemented:
SP Interrupt Mask enable. When SCTLR_EL1.NMI is 1, controls whether PSTATE.SP acts as an 
interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL1.
0b0    Does not cause PSTATE.SP to mask interrupts. 
PSTATE.ALLINT is set to 1 on taking an exception to EL1.
0b1    When PSTATE.SP is 1 and execution is at EL1, an IRQ or FIQ interrupt that is targeted 
to EL1 is masked regardless of any denotation of Superpriority. 
PSTATE.ALLINT is set to 0 on taking an exception to EL1.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to an 
  architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:
Non-maskable Interrupt enable.
0b0    This control does not affect interrupt masking behavior.
0b1    This control enables all of the following:
  - The use of the PSTATE.ALLINT interrupt mask.
  - IRQ and FIQ interrupts to have Superpriority as an additional attribute.
  - PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

Otherwise:
Reserved, RES0.
EnTP2, bit [60]

When FEAT_SME is implemented:

Traps instructions executed at EL0 that access TPIDR2_EL0 to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using ESR_ELx.EC value 0x18.

0b0 This control causes execution of these instructions at EL0 to be trapped.
0b1 This control does not cause execution of any instructions to be trapped.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [59:58]
Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

0b0 No additional Permission faults are generated by this mechanism.
0b1 An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault.

Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented:

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

0b0 Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.
0b1 This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x00000002.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
EnAS0, bit [55]

*When FEAT_LS64_ACCDATA is implemented:*

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

- **0b0** Execution of an ST64BV0 instruction at EL0 is trapped to EL1.
- **0b1** This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

EnASR, bit [54]

*When FEAT_LS64_V is implemented:*

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

- **0b0** Execution of an ST64BV instruction at EL0 is trapped to EL1.
- **0b1** This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

TME, bit [53]

*When FEAT_TME is implemented:*

Enables the Transactional Memory Extension at EL1.

- **0b0** Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNEDEFINED at EL1.
- **0b1** This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

TME0, bit [52]

*When FEAT_TME is implemented:*

Enables the Transactional Memory Extension at EL0.

- **0b0** Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNEDEFINED at EL0.
- **0b1** This control does not cause any TSTART instruction to be trapped.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1, 1}, this field has no effect on execution at EL0.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL1.

0b0       This control does not cause any TSTART instruction to fail.
0b1       When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

0b0       This control does not cause any TSTART instruction to fail.
0b1       When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and

HCR_EL2.{E2H, TGE} == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]

When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

0b0       The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1       The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**DSSBS, bit [44]**

*When FEAT_SSBS is implemented:*
Default PSTATE.SSBS value on Exception Entry.

- **0b0** PSTATE.SSBS is set to 0 on an exception to EL1.
- **0b1** PSTATE.SSBS is set to 1 on an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**
Reserved, RES0.

**ATA, bit [43]**

*When FEAT_MTE2 is implemented:*
Allocation Tag Access in EL1.

When SCR_EL3.ATA == 1 and HCR_EL2.ATA == 1, controls access to Allocation Tags and Tag Check operations in EL1.

- **0b0** Access to Allocation Tags is prevented at EL1.
  Memory accesses at EL1 are not subject to a Tag Check operation.
- **0b1** This control does not prevent access to Allocation Tags at EL1.
  Tag Checked memory accesses at EL1 are subject to a Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**ATA0, bit [42]**

*When FEAT_MTE2 is implemented:*
Allocation Tag Access in EL0.

When SCR_EL3.ATA == 1, HCR_EL2.ATA == 1, and HCR_EL2.{E2H, TGE} != {1, 1}, controls access to Allocation Tags and Tag Check operations in EL0.

- **0b0** Access to Allocation Tags is prevented at EL0.
  Memory accesses at EL0 are not subject to a Tag Check operation.
- **0b1** This control does not prevent access to Allocation Tags at EL0.
  Tag Checked memory accesses at EL0 are subject to a Tag Check operation.

--- **Note** ---

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.
TCF, bits [41:40]

When \textit{FEAT\_MTE2} is implemented:

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If \textit{FEAT\_MTE3} is not implemented, the value 0b11 is reserved.

0b00 Tag Check Faults have no effect on the PE.
0b01 Tag Check Faults cause a synchronous exception.
0b10 Tag Check Faults are asynchronously accumulated.
0b11 \textit{When \textit{FEAT\_MTE3} is implemented:}

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When \textit{FEAT\_MTE2} is implemented:

Tag Check Fault in EL0. When HCR\_EL2.E2H,TGE \neq \{1,1\}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If \textit{FEAT\_MTE3} is not implemented, the value 0b11 is reserved.

\textbf{Note}

Software may change this control bit on a context switch.

0b00 Tag Check Faults have no effect on the PE.
0b01 Tag Check Faults cause a synchronous exception.
0b10 Tag Check Faults are asynchronously accumulated.
0b11 \textit{When \textit{FEAT\_MTE3} is implemented:}

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When \textit{FEAT\_MTE2} is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0\_EL1 and TFSR\_EL1 registers.

0b0 Tag Check Faults are not synchronized on entry to EL1.
0b1 Tag Check Faults are synchronized on entry to EL1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
Otherwise:
  Reserved, RES0.

BT1, bit [36]

When FEAT_BTI is implemented:

PAC Branch Type compatibility at EL1.

  0b0  When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
  0b1  When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
  Reserved, RES0.

BT0, bit [35]

When FEAT_BTI is implemented:

PAC Branch Type compatibility at EL0.

  0b0  When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
  0b1  When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
  Reserved, RES0.

Bit [34]

Reserved, RES0.

MSCEn, bit [33]

When FEAT_MOPS is implemented and (HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0):

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

  0b0  Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
  0b1  This control does not cause any instructions to be UNDEFINED.

When FEAT_MOPS is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:
  • On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
  Reserved, RES0.
CMOW, bit [32]

When *FEAT_CMOW* is implemented:

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- **IC IV AU, DC CIVAC, DC CIGDVAC** and **DC CIGVAC**.

  0b0 These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault.

  0b1 If enabled as a result of **SCTLR_EL1.UCI==1**, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault.

When **AArch64.HCR_EL2.{E2H, TGE}** is {1, 1}, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- **AP[2]** is 0 or **DBM** is 1 in the stage 1 descriptor.
- Where **APTable** is in use, **APTable[1]** is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*  
Reserved, **RES0**.

EnIA, bit [31]

When *FEAT_PAuth* is implemented:

Controls enabling of pointer authentication (using the **APIAKey_EL1** key) of instruction addresses in the EL1&0 translation regime.

For more information, see **Pointer authentication** on page D8-5164.

  0b0 Pointer authentication (using the **APIAKey_EL1** key) of instruction addresses is not enabled.

  0b1 Pointer authentication (using the **APIAKey_EL1** key) of instruction addresses is enabled.

--- **Note** ---

This field controls the behavior of the **AddPACIA** and **AuthIA** pseudocode functions. Specifically, when the field is 1, **AddPACIA** returns a copy of a pointer to which a pointer authentication code has been added, and **AuthIA** returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

---

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*  
Reserved, **RES0**.

EnIB, bit [30]

When *FEAT_PAuth* is implemented:

Controls enabling of pointer authentication (using the **APIBKey_EL1** key) of instruction addresses in the EL1&0 translation regime.

For more information, see **Pointer authentication** on page D8-5164.

  0b0 Pointer authentication (using the **APIBKey_EL1** key) of instruction addresses is not enabled.
0b1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

__________ Note __________

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

0b0 For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES1.
EnDA, bit [27]

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see *Pointer authentication on page D8-5164.*

- **0b0** Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
- **0b1** Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

--- **Note** ---

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

---

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

If FEAT_DPB2 is implemented, this trap also applies to DC CVADP.

If FEAT_MTE is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP, and DC CGDVAP.

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

- **0b0** Execution of the specified instructions at EL0 using AArch64 is trapped.
- **0b1** This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

0b0  Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.

0b1  Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

0b0  Explicit data accesses at EL0 are little-endian.

0b1  Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

0b0  PSTATE.PAN is set to 1 on taking an exception to EL1.

0b1  The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

0b0  The taking of an exception to EL1 is not a context synchronizing event.

0b1  The taking of an exception to EL1 is a context synchronizing event.
When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1,1\}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:
- Indirect writes to ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1 are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:
- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES1.

**IESB, bit [21]**

*When FEAT_IESB is implemented:*
Implicit Error Synchronization event enable. Possible values are:
- 0b0  Disabled.
- 0b1  An implicit error synchronization event is added:
  - At each exception taken to EL1.
  - Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**TSCXT, bit [20]**

*When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:*
Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.
- 0b0  EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
- 0b1  EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

The value of SCXTNUM_EL0 is treated as 0.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1,1\}, this bit has no effect on execution at EL0.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

- 0b0 This control has no effect on memory access permissions.
- 0b1 Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**nTWE, bit [18]**

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

- 0b0 Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
- 0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.
When \texttt{FEAT\_WFxT} is implemented, this trap also applies to the WFIT instruction.

- **0b0** Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
- **0b1** This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

--- **Note** ---

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

When \texttt{FEAT\_VHE} is implemented, and the value of \texttt{HCR\_EL2.\{E2H, TGE\}} is \{1, 1\}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**UCT, bit [15]**

Traps EL0 accesses to the \texttt{CTR\_EL0} to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2.TGE} is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of \(0x18\).

- **0b0** Accesses to the \texttt{CTR\_EL0} from EL0 using AArch64 are trapped.
- **0b1** This control does not cause any instructions to be trapped.

When \texttt{FEAT\_VHE} is implemented, and the value of \texttt{HCR\_EL2.\{E2H, TGE\}} is \{1, 1\}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**DZE, bit [14]**

Traps EL0 execution of DC ZVA instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2.TGE} is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of \(0x18\).

If \texttt{FEAT\_MTE} is implemented, this trap also applies to DC GVA and DC GZVA.

- **0b0** Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped.
  
  Reading \texttt{DCZID\_EL0.DZP} from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
- **0b1** This control does not cause any instructions to be trapped.

When \texttt{FEAT\_VHE} is implemented, and the value of \texttt{HCR\_EL2.\{E2H, TGE\}} is \{1, 1\}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**EnDB, bit [13]**

\textbf{When \texttt{FEAT\_PAuth} is implemented:}

Controls enabling of pointer authentication (using the \texttt{APDBKey\_EL1} key) of instruction addresses in the EL1&0 translation regime.
For more information, see *Pointer authentication* on page D8-5164.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

---

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

---

**I, bit [12]**

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable.</td>
</tr>
<tr>
<td></td>
<td>If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1.</td>
</tr>
<tr>
<td></td>
<td>If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

---

**EOS, bit [11]**

*When FEAT_ExS is implemented:*

Exception Exit is Context Synchronizing.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL1 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL1 is a context synchronizing event</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1,1\}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
• Behavior of accessing the banked copies of the stack pointer using the SP register name for
loads, stores and data processing instructions.
• Exit from Debug state.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an
architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES1.

**EnRCTX, bit [10]**

**When FEAT_SPECRES is implemented:**
Enable EL0 Access to the following instructions:
• AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
• AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

0b0 EL0 access to these instructions is disabled, and these instructions are trapped to EL1,
or to EL2 when it is implemented and enabled for the current Security state and
HCR_EL2.TGE is 1.
0b1 EL0 access to these instructions is enabled.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1,1\}, this bit has
no effect on execution at EL0.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an
architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**UMA, bit [9]**

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.\{D,
A, I, F\} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state
and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

0b0 Any attempt at EL0 using AArch64 to execute an MRS, MSR\{register\}, or MSR\{immediate\}
instruction that accesses the DAIF is trapped.
0b1 This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has
no effect on execution at EL0.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL1, this field resets to an
architecturally UNKNOWN value.

**SED, bit [8]**

**When EL0 is capable of using AArch32:**
SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0b0 SETEND instruction execution is enabled at EL0 using AArch32.
0b1 SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to
access a SETEND instruction generates an exception to EL1, or to EL2 when it is
implemented and enabled for the current Security state and HCR_EL2.TGE is 1,
reported using an ESR_ELx.EC value of 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is
RES1.
When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0. The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**ITD, bit [7]**

**When EL0 is capable of using AArch32:**

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

- **0b0** All IT instruction functionality is enabled at EL0 using AArch32.
- **0b1** Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x0, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:
  - All encodings of the IT instruction with hw1[3:0]!=1000.
  - All encodings of the subsequent instruction with the following values for hw1:
    - 0b1xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
    - 0b101xxxxxxxxxxxx: All instructions in Miscellaneous 16-bit instructions on page F3-7303.
    - 0b1010xxxxxxxxxxxx: ADD Rd, #imm
    - 0b0101xxxxxxxxxxxx: LDR Rd, [PC, #imm]
    - 0b01001xxxxxxxxxxxx: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.
    - 0b010001xxxxxxxxxxxx: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see Changes to an ITD control by an instruction in an IT block on page E1-7138.

ITD is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0. The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.
nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.

0b0 Unaligned accesses by the specified instructions generate an Alignment fault.
0b1 This control does not generate Alignment faults.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

0b0 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x00.
0b1 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-4668.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
SA, bit [3]
SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-4668.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]
Stage 1 Cacheability control, for data accesses.

0b0 All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.

0b1 This control has no effect on the Stage 1 Cacheability of:
- Data access to Normal memory from EL0 and EL1.
- Normal memory accesses to the EL1&0 Stage 1 translation tables.

When the value of the HCR_EL2.DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]
Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

0b0 Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

If FEAT_MOPS is implemented, SETG* instructions have an alignment check regardless of the value of the A bit.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]
MMU enable for EL1&0 stage 1 address translation.

0b0 EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.

0b1 EL1&0 stage 1 address translation enabled.
If the value of \texttt{HCR\_EL2.\{DC, TGE\}} is not \{0, 0\} then in Non-secure state the PE behaves as if the value of the \texttt{SCTLR\_EL1.M} field is 0 for all purposes other than returning the value of a direct read of the field.

When \texttt{FEAT\_VHE} is implemented, and the value of \texttt{HCR\_EL2.\{E2H, TGE\}} is \{1, 1\}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

### Accessing SCTLR\_EL1

When \texttt{HCR\_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic \texttt{SCTLR\_EL1} or \texttt{SCTLR\_EL12} are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <xt>, SCTLR\_EL1**

D17.2.119 SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.
When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, these controls apply also to execution at EL0.

Configurations

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].
If EL2 is not implemented, this register is RES0 from EL3.
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

TIDCP, bit [63]

*When FEAT_TIDCP1 is implemented and HCR_EL2.E2H == 1:*

Trap IMPLEMENTATION DEFINED functionality. Traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2.

0b0 No instructions accessing the System register or System instruction spaces are trapped by this mechanism.

0b1 If HCR_EL2.TGE==0, no instructions accessing the System register or System instruction spaces are trapped by this mechanism.
If HCR_EL2.TGE==1, instructions accessing the following System register or System instruction spaces are trapped to EL2 by this mechanism:

- In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.

- In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**SPINTMASK, bit [62]**

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL2.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL2.

**0b0**
Does not cause PSTATE.SP to mask interrupts.
PSTATE.ALLINT is set to 1 on taking an exception to EL2.

**0b1**
When PSTATE.SP is 1 and execution is at EL2, an IRQ or FIQ interrupt that is targeted to EL2 is masked regardless of any denotation of Superpriority.
PSTATE.ALLINT is set to 0 on taking an exception to EL2.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**NMI, bit [61]**

When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

**0b0**
This control does not affect interrupt masking behavior.

**0b1**
This control enables all of the following:
- The use of the PSTATE.ALLINT interrupt mask.
- IRQ and FIQ interrupts to have Superpriority as an additional attribute.
- PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**
Reserved, RES0.
EnTP2, bit [60]

**When FEAT_SME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps instructions executed at EL0 that access TPIDR_EL0 to EL2 when EL2 is implemented and enabled for the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

- **0b0** This control causes execution of these instructions at EL0 to be trapped.
- **0b1** This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**When FEAT_SME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:**

IGNORED.

**Otherwise:**

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

EPAN, bit [57]

**When FEAT_PAN3 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

- **0b0** No additional Permission faults are generated by this mechanism.
- **0b1** An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault.

Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**When FEAT_PAN3 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:**

IGNORED.

**Otherwise:**

Reserved, RES0.

EnALS, bit [56]

**When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

- **0b0** Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.
- **0b1** This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:**

IGNORED.
Otherwise:
Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
Traps execution of an ST64BV0 instruction at EL0 to EL2.
0b0 Execution of an ST64BV0 instruction at EL0 is trapped to EL2.
0b1 This control does not cause any instructions to be trapped.
A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64_ACCDATA is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
IGNORED.
Otherwise:
Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
Traps execution of an ST64BV instruction at EL0 to EL2.
0b0 Execution of an ST64BV instruction at EL0 is trapped to EL2.
0b1 This control does not cause any instructions to be trapped.
A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64_V is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
IGNORED.
Otherwise:
Reserved, RES0.

TME, bit [53]
When FEAT_TME is implemented:
Enables the Transactional Memory Extension at EL2.
0b0 Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.
0b1 This control does not cause any TSTART instruction to be trapped.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
TME0, bit [52]

*When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:*

Enables the Transactional Memory Extension at EL0.

0b0  Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.

0b1  This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:*

_IGNORED._

*Otherwise:*

Reserved, RES0.

TMT, bit [51]

*When FEAT_TME is implemented:*

Forces a trivial implementation of the Transactional Memory Extension at EL2.

0b0  This control does not cause any TSTART instruction to fail.

0b1  When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

TMT0, bit [50]

*When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:*

Forces a trivial implementation of the Transactional Memory Extension at EL0.

0b0  This control does not cause any TSTART instruction to fail.

0b1  When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:*

_IGNORED._

*Otherwise:*

Reserved, RES0.

TWEDEL, bits [49:46]

*When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:*

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
IGNORED.

Otherwise:
Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by
SCTRL_EL2.nTWE.

0b0 The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1 The delay for taking a WFE trap is at least the number of cycles defined in
SCTRL_EL2.TWEDEL.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an
architecturally UNKNOWN value.

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
IGNORED.

Otherwise:
Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:
Default PSTATE.SSBS value on Exception Entry.

0b0 PSTATE.SSBS is set to 0 on an exception to EL2.
0b1 PSTATE.SSBS is set to 1 on an exception to EL2.

The reset behavior of this field is:
• On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:
Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:
Allocation Tag Access in EL2.

When SCR_EL3.ATA is 1, controls access to Allocation Tags and Tag Check operations in EL2.

0b0 Access to Allocation Tags is prevented at EL2.
Memory accesses at EL2 are not subject to a Tag Check operation.
0b1 This control does not prevent access to Allocation Tags at EL2.
Tag Checked memory accesses at EL2 are subject to a Tag Check operation.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an
architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
Allocation Tag Access in EL0.
When SCR_EL3.ATA is 1, controls access to Allocation Tags and Tag Check operations in EL0.

0b0  Access to Allocation Tags is prevented at EL0.
      Memory accesses at EL0 are not subject to a Tag Check operation.

0b1  This control does not prevent access to Allocation Tags at EL0.
      Tag Checked memory accesses at EL0 are subject to a Tag Check operation.

--- Note ---
Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
IGNORED.

Otherwise:
Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:
Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

0b00  Tag Check Faults have no effect on the PE.
0b01  Tag Check Faults cause a synchronous exception.
0b10  Tag Check Faults are asynchronously accumulated.
0b11  When FEAT_MTE3 is implemented:
      Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TCF0, bits [39:38]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

0b00  Tag Check Faults have no effect on the PE.
0b01  Tag Check Faults cause a synchronous exception.
0b10  Tag Check Faults are asynchronously accumulated.
0b11  When FEAT_MTE3 is implemented:
      Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

--- Note ---
Software may change this control bit on a context switch.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:*

- IGNORED.

*Otherwise:*

  Reserved, RES0.

**ITFSB, bit [37]**

*When FEAT_MTE2 is implemented:*

  When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1, TFSR_EL1 and TFSR_EL2 registers.

- **0b0**: Tag Check Faults are not synchronized on entry to EL2.
- **0b1**: Tag Check Faults are synchronized on entry to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

  Reserved, RES0.

**BT, bit [36]**

*When FEAT_BTI is implemented:*

  PAC Branch Type compatibility at EL2.

  When HCR_EL2.{E2H, TGE} == {1, 1}, this bit is named BT1.

- **0b0**: When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
- **0b1**: When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

  Reserved, RES0.

**BT0, bit [35]**

*When FEAT_BTI is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:*

  PAC Branch Type compatibility at EL0.

- **0b0**: When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
- **0b1**: When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*When FEAT_BTI is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:*

  IGNORED.
**Otherwise:**

Reserved, RES0.

**Bit [34]**

Reserved, RES0.

**MSCEn, bit [33]**

When FEAT_MOPS is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

- **0b0** Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
- **0b1** This control does not cause any instructions to be UNDEFINED.

When FEAT_MOPS is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_MOPS is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

**Otherwise:**

Reserved, RES0.

**CMOW, bit [32]**

When FEAT_CMOW is implemented and HCR_EL2.E2H == 1:

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- IC IVAU, DC CIVAC, DC CIGDVAC and DC CIGVAC.

- **0b0** These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault.

- **0b1** If enabled as a result of SCTLR_EL2.UCI==1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault.

When HCR_EL2.TGE is 0, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTable is in use, APTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnIA, bit [31]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see Pointer authentication on page D8-5164.

- **0b0** Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

Reserved, RES0.
0b1  Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

——— Note ————
This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

——— Note ————
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:
Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.
For more information, see Pointer authentication on page D8-5164.
0b0  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

——— Note ————
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

——— Note ————
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
Load Multiple and Store Multiple Atomicity and Ordering Enable.
0b0  For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1  The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.
This bit is permitted to be cached in a TLB.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
IGNORED.
Otherwise:
    Reserved, RES1.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0    All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1    All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:
    • On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
    IGNORED.

Otherwise:
    Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see Pointer authentication on page D8-5164.

0b0    Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.

0b1    Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note
This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:
    • On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
    Reserved, RES0.

UCI, bit [26]
When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

If FEAT_DPB2 is implemented, this trap also applies to DC CVADP.

If FEAT_MTE is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP, and DC CGDVAP.
If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

```
EE, bit [25]
```

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

0b0 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.

0b1 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:
- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

```
E0E, bit [24]
```

Endianness of data accesses at EL0.

0b0 Explicit data accesses at EL0 are little-endian.

0b1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:**

IGNORED.

**Otherwise:**

Reserved, RES0.

**SPAN, bit [23]**

**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Set Privileged Access Never, on taking an exception to EL2.

- 0b0 PSTATE.PAN is set to 1 on taking an exception to EL2.
- 0b1 The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:**

IGNORED.

**Otherwise:**

Reserved, RES1.

**EIS, bit [22]**

**When FEAT_ExS is implemented:**

Exception entry is a context synchronization event.

- 0b0 The taking of an exception to EL2 is not a context synchronization event.
- 0b1 The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.

- Exception Catch debug events are synchronous debug events.

- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.

- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.

- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.
IESB, bit [21]

When **FEAT_IESB is implemented**:
- Implicit Error Synchronization event enable.
  - 0b0: Disabled.
  - 0b1: An implicit error synchronization event is added:
    - At each exception taken to EL2.
    - Before the operational pseudocode of each **ERET** instruction executed at EL2.

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each **DCPSx** instruction taken to EL2 and before each **DRPS** instruction executed at EL2, in addition to the other cases where it is added.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**
- Reserved, RES0.

TSCXT, bit [20]

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
- Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.
  - 0b0: EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
  - 0b1: EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:
- Reserved, RES1.

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:
- IGNORED.

**Otherwise:**
- Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.
- 0b0: This control has no effect on memory access permissions.
- 0b1: Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.
nTWE, bit [18]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

0b0 Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

--- Note ---

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

--- Note ---

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.
UCT, bit [15]

When $HCR\_EL2.2H == 1$ and $HCR\_EL2.TGE == 1$:

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

- $0b0$ Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.
- $0b1$ This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When $HCR\_EL2.2H == 1$ and $HCR\_EL2.TGE == 0$:

IGNORED.

Otherwise:

Reserved, RES0.

DZE, bit [14]

When $HCR\_EL2.2H == 1$ and $HCR\_EL2.TGE == 1$:

Traps execution of DC ZVA instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE is implemented, this trap also applies to DC GVA and DC GZVA.

- $0b0$ Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
- $0b1$ This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When $HCR\_EL2.2H == 1$ and $HCR\_EL2.TGE == 0$:

IGNORED.

Otherwise:

Reserved, RES0.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see Pointer authentication on page D8-5164.

- $0b0$ Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
- $0b1$ Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and \( \text{HCR\_EL2.\{E2H,TGE\}} = \{1,1\}, \text{EL0} \).

0b0  
All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.
When EL2 is enabled in the current Security state and \( \text{HCR\_EL2.\{E2H, TGE\}} = \{1, 1\} \), all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache.
If SCTLR\_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1  
This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when EL2 is enabled in the current Security state and \( \text{HCR\_EL2.\{E2H, TGE\}} = \{1, 1\} \), instruction access to Normal memory from EL0.
If the value of SCTLR\_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regime.
When EL2 is disabled in the current Security state or \( \text{HCR\_EL2.\{E2H, TGE\}} \neq \{1,1\} \), this bit has no effect on the EL1&0 translation regime.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

*When FEAT\_ExS is implemented:*

Exception exit is a context synchronization event.

0b0  
An exception return from EL2 is not a context synchronization event.

0b1  
An exception return from EL2 is a context synchronization event.

If SCTLR\_EL2.EOS is set to 0b0:
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
The following are not affected by the value of SCTLR\_EL2.EOS:
- The indirect write of the PSTATE and PC values from SPSR\_EL2 and ELR\_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES1.

EnRCTX, bit [10]

*When FEAT\_SPECRES is implemented, HCR\_EL2.E2H == 1 and HCR\_EL2.TGE == 1:*

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
• AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When `FEAT_SPECRES` is implemented, `HCR_EL2.E2H == 1` and `HCR_EL2.TGE == 0`:
IGNORED.

Otherwise:
Reserved, RES0.

Bit [9]
Reserved, RES0.

SED, bit [8]

When EL0 is capable of using AArch32, `HCR_EL2.E2H == 1` and `HCR_EL2.TGE == 1`:
SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, `HCR_EL2.E2H == 1` and `HCR_EL2.TGE == 1`:
Reserved, RES1.

When EL0 is capable of using AArch32, `HCR_EL2.E2H == 1` and `HCR_EL2.TGE == 0`:
IGNORED.

Otherwise:
Reserved, RES0.

ITD, bit [7]

When EL0 is capable of using AArch32, `HCR_EL2.E2H == 1` and `HCR_EL2.TGE == 1`:
IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</td>
</tr>
</tbody>
</table>
• All encodings of the IT instruction with hw1[3:0]!=1000. |
• All encodings of the subsequent instruction with the following values for hw1:
  — 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. |
  — 0b101xxxxxxxxxxxx: All instructions in Miscellaneous 16-bit instructions on page F3-7303. |
  — 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm |
  — 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] |
  — 0b01000xxxxx111111: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. |
  — 0b010001xx1xxx111111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. |
These instructions are always **UNDEFINED**, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is **IMPLEMENTATION DEFINED** whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are **UNDEFINED**, either the second 16-bit instruction or the 32-bit instruction is **UNDEFINED**.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is **CONSTRAINED UNPREDICTABLE**. For more information see Changes to an ITD control by an instruction in an IT block on page E1-7138.

ITD is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

When an implementation does not implement ITD, access to this field is RAZ/WI.

**When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Reserved, RES1.

**When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:**

IGNORED.

**Otherwise:**

Reserved, RES0.

**nAA, bit [6]**

**When FEAT_LSE2 is implemented:**

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}, EL0.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLRRH, STLR, STLRH, STLUR, and STLURH

0b0 Unaligned accesses by the specified instructions generate an Alignment fault.

0b1 Unaligned accesses by the specified instructions do not generate an Alignment fault.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**CP15BEN, bit [5]**

**When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

0b0 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is **UNDEFINED**.
EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES0.

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

SA0, bit [4]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-4668.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-4668.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}, EL0

0b0 The following are Non-cacheable for all levels of data and unified cache:

- Data accesses to Normal memory from EL2.
- When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables.
- When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}:
  — Data accesses to Normal memory from EL0.
  — Normal memory accesses to the EL2&0 translation tables.

0b1 This control has no effect on the Cacheability of:

- Data access to Normal memory from EL2.
- When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables.
• When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == \{1, 1\}:
  — Data accesses to Normal memory from EL0.
  — Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or HCR_EL2.{E2H, TGE} != \{1, 1\}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == \{1, 1\}, EL0.

0b0 Alignment fault checking disabled when executing at EL2.

When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == \{1, 1\}, alignment fault checking disabled when executing at EL0.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL2.

When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == \{1, 1\}, alignment fault checking enabled when executing at EL0.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

If FEAT_MOPS is implemented, SETG* instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

0b0 When HCR_EL2.{E2H, TGE} != \{1, 1\}, EL2 stage 1 address translation disabled.

When HCR_EL2.{E2H, TGE} == \{1, 1\}, EL2&0 stage 1 address translation disabled.

See the SCTLR_EL2.1 field for the behavior of instruction accesses to Normal memory.

0b1 When HCR_EL2.{E2H, TGE} != \{1, 1\}, EL2 stage 1 address translation enabled.

When HCR_EL2.{E2H, TGE} == \{1, 1\}, EL2&0 stage 1 address translation enabled.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Accessing SCTLR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:
### MRS <Xt>, SCTLR_EL2

D17.2.120  SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

Bit [63]

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL3.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL3.

0b0  Does not cause PSTATE.SP to mask interrupts.

PSTATE.ALLINT is set to 1 on taking an exception to EL3.

0b1  When PSTATE.SP is 1 and execution is at EL3, an IRQ or FIQ interrupt that is targeted to EL3 is masked regardless of any denotion of Superpriority.

PSTATE.ALLINT is set to 0 on taking an exception to EL3.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

0b0  This control does not affect interrupt masking behavior.
This control enables all of the following:

- The use of the PSTATE.ALLINT interrupt mask.
- IRQ and FIQ interrupts to have Superpriority as an additional attribute.
- PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [60:54]**

Reserved, RES0.

**TME, bit [53]**

*When FEAT_TME is implemented:*

Enables the Transactional Memory Extension at EL3.

- **0b0** Any attempt to execute a TSTART instruction at EL3 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL3.
- **0b1** This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [52]**

Reserved, RES0.

**TMT, bit [51]**

*When FEAT_TME is implemented:*

Forces a trivial implementation of the Transactional Memory Extension at EL3.

- **0b0** This control does not cause any TSTART instruction to fail.
- **0b1** When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [50:45]**

Reserved, RES0.

**DSSBS, bit [44]**

*When FEAT_SSBS is implemented:*

Default PSTATE.SSBS value on Exception Entry.

- **0b0** PSTATE.SSBS is set to 0 on an exception to EL3.
- **0b1** PSTATE.SSBS is set to 1 on an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.
ATA, bit [43]

When FEAT_MTE2 is implemented:
Allocation Tag Access in EL3.
Controls access to Allocation Tags and Tag Check operations in EL3.
0b0 Access to Allocation Tags is prevented at EL3.
Memory accesses at EL3 are not subject to a Tag Check operation.
0b1 This control does not prevent access to Allocation Tags at EL3.
Tag Checked memory accesses at EL3 are subject to a Tag Check operation.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bit [42]
Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:
Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.
If FEAT_MTE3 is not implemented, the value 0b11 is reserved.
0b0 Tag Check Faults have no effect on the PE.
0b1 Tag Check Faults cause a synchronous exception.
0b10 Tag Check Faults are asynchronously accumulated.
0b11 When FEAT_MTE3 is implemented:
Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [39:38]
Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:
When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1 and TFSR_ELx registers.
0b0 Tag Check Faults are not synchronized on entry to EL3.
0b1 Tag Check Faults are synchronized on entry to EL3.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
BT, bit [36]

When FEAT_BTI is implemented:

PAC Branch Type compatibility at EL3.

0b0  When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

0b1  When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

0b0  Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

0b1  Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

For more information, see Pointer authentication on page D8-5164.

——— Note ————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

———

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

0b0  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.

0b1  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.
For more information, see Pointer authentication on page D8-5164.

Note
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [29:28]
Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth is implemented:
Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

For more information, see Pointer authentication on page D8-5164.

Note
This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bit [26]
Reserved, RES0.

EE, bit [25]
Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

0b0 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.
If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.
The EE bit is permitted to be cached in a TLB.
The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**EIS, bit [22]**

*When FEAT_ExS is implemented:*

Exception Entry is Context Synchronizing.

- **0b0** The taking of an exception to EL3 is not a context synchronizing event.
- **0b1** The taking of an exception to EL3 is a context synchronizing event.

If SCTLR_EL3.EIS is set to **0b0**:

- Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

*When FEAT_IESB is implemented:*

Implicit Error Synchronization event enable.

- **0b0** Disabled.
- **0b1** An implicit error synchronization event is added:
  - At each exception taken to EL3.
  - Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, SCR_EL3.NMEA. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, the PE is in Non-debug state, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Otherweise:
Reserved, RES0.

Bit [20]
Reserved, RES0.

WXN, bit [19]
Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all
memory regions that are writable to be treated as XN.
0b0 This control has no effect on memory access permissions.
0b1 Any region that is writable in the EL3 translation regime is forced to XN for accesses
from software executing at EL3.
This bit applies only when SCTLR_EL3.M bit is set.
The WXN bit is permitted to be cached in a TLB.
The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an
architecturally UNKNOWN value.

Bit [18]
Reserved, RES1.

Bit [17]
Reserved, RES0.

Bit [16]
Reserved, RES1.

Bits [15:14]
Reserved, RES0.

EnDB, bit [13]
When FEAT_PAuth is implemented:
Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses
in the EL3 translation regime.
0b0 Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1 Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.
For more information, see Pointer authentication on page D8-5164.

Note
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically,
when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code
has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of
these functions are NOP.

The reset behavior of this field is:
• On a Warm reset, in a system where the PE resets into EL3, this field resets to an
architecturally UNKNOWN value.

Otherweise:
Reserved, RES0.
I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

0b0  All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1  This control has no effect on the Cacheability of instruction access to Normal memory from EL3.

If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

**When FEAT_ExS is implemented:**

Exception Exit is Context Synchronizing.

0b0  An exception return from EL3 is not a context synchronizing event

0b1  An exception return from EL3 is a context synchronizing event

If SCTLR_EL3.EOS is set to 0b0:

• Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.

• Exception Catch debug events are synchronous debug events.

• DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

• The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.

• If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.

• The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.

• Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.

• Exit from Debug state.

The reset behavior of this field is:

• On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

Bits [10:7]

Reserved, RES0.
nAA, bit [6]

When `FEAT_LSE2` is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions. The following instructions generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STL, STLHR, STLUR, and STLURH

0b0 Unaligned accesses by the specified instructions generate an Alignment fault.
0b1 Unaligned accesses by the specified instructions do not generate an Alignment fault.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-4668.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

0b0 All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1 This control has no effect on the Cacheability of:
  - Data access to Normal memory from EL3.
  - Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

0b0 Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1 Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.
If `FEAT_MOPS` is implemented, `SETG*` instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**M, bit [0]**

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

- **0b0** EL3 stage 1 address translation disabled.
  - See the `SCTLR_EL3.I` field for the behavior of instruction accesses to Normal memory.
- **0b1** EL3 stage 1 address translation enabled.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

### Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, SCTLR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0001</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  X[t, 64] = SCTLR_EL3;
```

**MSR SCTLR_EL3, <Xt>**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  SCTLR_EL3 = X[t, 64];
```
D17.2.121 SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configurations**

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

**Attributes**

SCXTNUM_EL0 is a 64-bit register.

**Field descriptions**

- **Bits [63:0]**
  - Software Context Number. A number to identify the context within the EL0 exception level.
  - The reset behavior of this field is:
    - On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing SCXTNUM_EL0**

Accesses to this register use the following encodings in the System register encoding space:

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b011 & 0b1101 & 0b0000 & 0b111 \\
\end{array}
\]

```c
if PSTATE_EL == EL0 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && SCR_EL3.EnSCXT == '0' then
    UNDEFINED;

D17.2.122 SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

**Purpose**
Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configurations**
This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

**Attributes**
SCXTNUM_EL1 is a 64-bit register.

**Field descriptions**

```
+-------------------+-------------------+
| Bits [63:0]        | Software Context Number |
|-------------------+-------------------|
| 63 32             | Software Context Number |
| 31 0              |                   |
```

Bits [63:0]
Software Context Number. A number to identify the context within the EL1 exception level.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing SCXTNUM_EL1**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, SCXTNUM_EL1**

```
<table>

D17.2.123   SCXTNUM_EL2, EL2 Read/Write Software Context Number

The SCXTNUM_EL2 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configurations**

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

SCXTNUM_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Software Context Number</td>
<td>A number to identify the context within the EL2 exception level. The reset behavior of this field is:</td>
</tr>
<tr>
<td>• On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing SCXTNUM_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCXTNUM_EL2 or SCXTNUM_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D17.2.125 SMCR_EL1, SME Control Register (EL1)

The SMCR_EL1 characteristics are:

**Purpose**

This register controls aspects of Streaming SVE that are visible at Exception levels EL1 and EL0.

**Configurations**

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL1 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode.

When HCR_EL2.{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, this register has no effect on execution at EL0 and EL1.

**Attributes**

SMCR_EL1 is a 64-bit register.

**Field descriptions**

**Bits [63:32]**

Reserved, RES0.

**FA64, bit [31]**

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

0b0 This control does not cause any instruction to be treated as legal in Streaming SVE mode.

0b1 This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL1 and EL0, if they are treated as legal at more privileged Exception levels in the current Security state.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [30:9]**

Reserved, RES0.

**Bits [8:4]**

Reserved, RAZ/WI.
LEN, bits [3:0]
Requests an Effective Streaming SVE vector length (SVL) at EL1 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or HCR_EL2.{E2H,TGE} is not {1,1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL. When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL1.

For all purposes other than returning the result of a direct read of SMCR_EL1, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.
3. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
4. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SMCR_EL1 or SMCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b000 & 0b0001 & 0b0010 & 0b110 \\
\end{array}
\]

D17.2.126  SMCR_EL2, SME Control Register (EL2)

The SMCR_EL2 characteristics are:

**Purpose**

This register controls aspects of Streaming SVE that are visible at Exception levels EL2, EL1, and EL0.

**Configurations**

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL2 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode, or if EL2 is not enabled in the current Security state.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

SMCR_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [30:9]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>Bits [8:4]</td>
<td>Reserved, RAZ/WI.</td>
</tr>
<tr>
<td>Bits [4:0]</td>
<td>LEN</td>
</tr>
</tbody>
</table>

**FA64, bit [31]**

*When FEAT_SME_FA64 is implemented:*

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

0b0  This control does not cause any instruction to be treated as legal in Streaming SVE mode.

0b1  This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL2, if they are treated as legal at EL3.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

* On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL2 of \((LEN+1)\times 128\) bits. This field also defines the Effective Streaming SVE vector length at EL0 when EL2 is implemented and enabled in the current Security state, and HCR_EL2.E2H,TGE is \{1,1\}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective vector length (VL) is equal to SVL. When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL2.

For all purposes other than returning the result of a direct read of SMCR_EL2, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
3. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SMCR_EL2 or SMCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D17.2.127 SMCR_EL3, SME Control Register (EL3)

The SMCR_EL3 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at all Exception levels.

Configurations

This register is present only when FEAT_SME is implemented and EL3 is implemented. Otherwise, direct accesses to SMCR_EL3 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode.

Attributes

SMCR_EL3 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

0b0 This control does not cause any instruction to be treated as legal in Streaming SVE mode.

0b1 This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL3.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL3 of (LEN+1)*128 bits.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.
When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL. When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL3.

For all purposes other than returning the result of a direct read of SMCR_EL3, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D17.2.128  SMIDR_EL1, Streaming Mode Identification Register

The SMIDR_EL1 characteristics are:

**Purpose**

Provides additional identification mechanisms for scheduling purposes, for a PE that supports Streaming SVE mode.

**Configurations**

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMIDR_EL1 are UNDEFINED.

**Attributes**

SMIDR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

- 0x00  Reserved for software use.
- 0x41  Arm Limited.
- 0x42  Broadcom Corporation.
- 0x43  Cavium Inc.
- 0x44  Digital Equipment Corporation.
- 0x46  Fujitsu Ltd.
- 0x49  Infineon Technologies AG.
- 0x4D  Motorola or Freescale Semiconductor Inc.
- 0x50  NVIDIA Corporation.
- 0x51  Applied Micro Circuits Corporation.
- 0x56  Marvell International Ltd.
- 0x69  Intel Corporation.
- 0x5E  Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

It is not required that this value is the same as the value of MIDR_EL1.Implementer. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.
Revision, bits [23:16]

Revision number for the Streaming Mode Compute Unit (SMCU).
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

SMPS, bit [15]

Indicates support for Streaming SVE mode execution priority.
0b0 Priority control not supported.
0b1 Priority control supported.

Bits [14:12]

Reserved, RES0.

Affinity, bits [11:0]

The SMCU affinity of the accessing PE.
• A value of zero indicates that the PE's implementation of Streaming SVE mode is not shared
  with other PEs.
• Otherwise, the value identifies which SMCU is associated with this PE. The Affinity value
  associated with each SMCU is unique within the system as a whole.

Accessing SMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS} \ <X_t>, \ SMIDR_EL1
\]

D17.2.129 SMPRIMAP_EL2, Streaming Mode Priority Mapping Register

The SMPRIMAP_EL2 characteristics are:

**Purpose**

Maps the value in SMPRI_EL1 to a streaming execution priority value for instructions executed at EL1 and EL0 in the same Security states as EL2.

**Configurations**

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRIMAP_EL2 are UNDEFINED.

When SMIDR_EL1.SMPS is '0', this register is RES0.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

SMPRIMAP_EL2 is a 64-bit register.

**Field descriptions**

When all of the following are true, the value in SMPRI_EL1 is mapped to a streaming execution priority using this register:

- The current Exception level is EL1 or EL0.
- EL2 is implemented and enabled in the current Security state.
- HCRX_EL2.SMPME is '1'.

Otherwise, SMPRI_EL1 holds the streaming execution priority value.

**P15, bits [63:60]**

Priority Mapping Entry 15. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '15'.

This value is the highest streaming execution priority.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P14, bits [59:56]**

Priority Mapping Entry 14. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '14'.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P13, bits [55:52]**

Priority Mapping Entry 13. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '13'.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
P12, bits [51:48]
Priority Mapping Entry 12. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '12'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P11, bits [47:44]
Priority Mapping Entry 11. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '11'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P10, bits [43:40]
Priority Mapping Entry 10. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '10'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P9, bits [39:36]
Priority Mapping Entry 9. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '9'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P8, bits [35:32]
Priority Mapping Entry 8. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '8'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P7, bits [31:28]
Priority Mapping Entry 7. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '7'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P6, bits [27:24]
Priority Mapping Entry 6. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '6'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P5, bits [23:20]
Priority Mapping Entry 5. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '5'.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P4, bits [19:16]
Priority Mapping Entry 4. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '4'.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P3, bits [15:12]**
Priority Mapping Entry 3. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is ‘3’.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P2, bits [11:8]**
Priority Mapping Entry 2. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is ‘2’.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P1, bits [7:4]**
Priority Mapping Entry 1. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is ‘1’.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P0, bits [3:0]**
Priority Mapping Entry 0. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is ‘0’.
This value is the lowest streaming execution priority.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing SMPRIMAP_EL2**

D17.2.130 SMPRI_EL1, Streaming Mode Priority Register

The SMPRI_EL1 characteristics are:

**Purpose**

Configures the streaming execution priority for instructions executed on a shared Streaming Mode Compute Unit (SMCU) when the PE is in Streaming SVE mode at any Exception Level.

**Configurations**

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRI_EL1 are UNDEFINED.

When SMIDR_EL1.SMPS is '0', this register is RES0.

**Attributes**

SMPRI_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>Priority</td>
</tr>
</tbody>
</table>

**Bits [63:4]**

Reserved, RES0.

**Priority, bits [3:0]**

Streaming execution priority value.

Either this value is used directly, or it is mapped into an effective priority value using SMPRIMAP_EL2.

This value is used directly when any of the following are true:

- The current Exception level is EL3 or EL2.
- The current Exception level is EL1 or EL0, if EL2 is implemented and enabled in the current Security state and HCRX_EL2.SMPME is '0'.
- The current Exception level is EL1 or EL0, if EL2 is either not implemented or not enabled in the current Security state.

The precise meaning and behavior of each streaming execution priority value is IMPLEMENTATION DEFINED.

In an implementation that shares execution resources between PEs, higher priority values are allocated more processing resource than other PEs configured with lower priority values in the same Priority domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing SMPRI_EL1**

Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, SMPRI_EL1

if PSTATE.EL == EL0 then

else
  SMPRI_EL1 = X[t, 64];

D17.2.131 TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

**Purpose**

The control register for stage 1 of the EL1&0 translation regime.

**Configurations**

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0].

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0].

**Attributes**

TCR_EL1 is a 64-bit register.

**Field descriptions**

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:60]**

Reserved, RES0.

**DS, bit [59]**

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.

- **0b0** Bits[49:48] of translation descriptors are RES0.
  
  
  - The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.
  
  - Output address[51:48] is 0b0000.

- **0b1** Bits[49:48] of translation descriptors hold output address[49:48].
  
  - Bits[9:8] of Translation table descriptors hold output address[51:50].
The shareability information of Block and Page descriptors for cacheable locations is determined by:

- TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1.
- TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1.

The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.

Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases.

--- Note ---

As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.

---

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

--- Note ---

This forces alignment of the ranges used by the TLBI range instructions.

---

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.{E2H,TGE}!={1,1}, when address[59:55] = 0b11111.

0b0 This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1 All accesses at EL1 and EL0 are Unchecked.

--- Note ---

Software may change this control bit on a context switch.

---

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.{E2H,TGE}!={1,1}, when address[59:55] = 0b00000.

0b0 This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1 All accesses at EL1 and EL0 are Unchecked.
— Note —

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When FEAT_E0PD is implemented:

Faulting control for Unprivileged access to any address translated by TTBR1_EL1.

0b0 Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.

0b1 Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When FEAT_E0PD is implemented:

Faulting control for Unprivileged access to any address translated by TTBR0_EL1.

0b0 Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.

0b1 Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]

When FEAT_SVE is implemented or FEAT_TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.
For more information, see FEAT_SVE.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

0b0  Does not disable stage 1 translation table walks using TTBR1_EL1.
0b1  A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**NFD0, bit [53]**

*When FEAT_SVE is implemented or FEAT_TME is implemented:*

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see FEAT_SVE.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

0b0  Does not disable stage 1 translation table walks using TTBR0_EL1.
0b1  A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**TBID1, bit [52]**

*When FEAT_PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see Address tagging on page D8-5162.

0b0  TCR_EL1.TBI1 applies to Instruction and Data accesses.
0b1  TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.
TBID0, bit [51]

When FEAT_PAuth is implemented:

- Controls the use of the top byte of instruction addresses for address matching.
- For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.
- For more information, see Address tagging on page D8-5162.

- \( 0b0 \): TCR_EL1.TBI0 applies to Instruction and Data accesses.
- \( 0b1 \): TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

- Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

- \( 0b0 \): For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- \( 0b1 \): For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

- Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

- \( 0b0 \): For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- \( 0b1 \): For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

0b0 For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

0b0 For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

0b0 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU061, bit [45]

When FEAT_HPDS2 is implemented:

   Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

   0b0  For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

   0b1  For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

   The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

   The reset behavior of this field is:
   
   • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

   Reserved, RES0.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

   Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

   0b0  For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

   0b1  For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

   The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

   The reset behavior of this field is:
   
   • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

   Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

   Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

   0b0  For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

   0b1  For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

   The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

   The reset behavior of this field is:
   
   • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

   Reserved, RES0.
HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

0b0  Hierarchical permissions are enabled.
0b1  Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

0b0  Hierarchical permissions are enabled.
0b1  Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

0b0  Stage 1 hardware management of dirty state disabled.
0b1  Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

0b0  Stage 1 Access flag update disabled.
0b1  Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.
0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

TBI0, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.
0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

AS, bit [36]

ASID Size.

0b0 8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.

0b1 16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is **RES0**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bit [35]
Reserved, RES0.

IPS, bits [34:32]
Intermediate Physical Address Size.

- **0b000**: 32 bits, 4GB.
- **0b001**: 36 bits, 64GB.
- **0b010**: 40 bits, 1TB.
- **0b011**: 42 bits, 4TB.
- **0b100**: 44 bits, 16TB.
- **0b101**: 48 bits, 256TB.
- **0b110**: 52 bits, 4PB.
- All other values are reserved.

The reserved values behave in the same way as the **0b101** or **0b110** encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and **FEAT_LPA2** is not implemented, the value **0b110** is treated as reserved.

It is **IMPLEMENTATION DEFINED** whether an implementation that does not implement **FEAT_LPA** supports setting the value of **0b110** for the 64KB translation granule size or whether setting this value behaves as the **0b101** encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not **0b110** or a value treated as **0b110**, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are **0b0000**.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]
Granule size for the TTBR1_EL1.

- **0b01**: 16KB.
- **0b10**: 4KB.
- **0b11**: 64KB.
- Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]
Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

- **0b00**: Non-shareable.
- **0b10**: Outer Shareable.
- **0b11**: Inner Shareable.
- Other values are reserved. The effect of programming this field to a Reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.
The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

- **0b00**: Normal memory, Outer Non-cacheable.
- **0b01**: Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- **0b10**: Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- **0b11**: Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

- **0b00**: Normal memory, Inner Non-cacheable.
- **0b01**: Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- **0b10**: Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- **0b11**: Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EPD1, bit [23]**

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

- **0b0**: Perform translation table walks using TTBR1_EL1.
- **0b1**: A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A1, bit [22]**

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

- **0b0**: TTBR0_EL1.ASID defines the ASID.
- **0b1**: TTBR1_EL1.ASID defines the ASID.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T1SZ, bits [21:16]**

The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

--- Note ---

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL1.

- 0b00: 4KB
- 0b01: 64KB
- 0b10: 16KB

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

- 0b00: Non-shareable
- 0b10: Outer Shareable
- 0b11: Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

- 0b00: Normal memory, Outer Non-cacheable.
- 0b01: Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10: Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11: Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

- 0b00: Normal memory, Inner Non-cacheable.
- 0b01: Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10: Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11: Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
EPD0, bit [7]
Translation table walk disable for translations using TTBR0_EL1. This bit controls whether a
translation table walk is performed on a TLB miss, for an address that is translated using
TTBR0_EL1. The encoding of this bit is:
0b0 Perform translation table walks using TTBR0_EL1.
0b1 A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation
fault. No translation table walk is performed.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]
Reserved, RES0.

T0SZ, bits [5:0]
The size offset of the memory region addressed by TTBR0_EL1. The region size is \(2^{(64-T0SZ)}\) bytes.
The maximum and minimum possible values for T0SZ depend on the level of translation table and
the memory translation granule size, as described in the AArch64 Virtual Memory System
Architecture chapter.

Note
For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the
translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the
translation table walk begins with a level 0 initial lookup.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL1
When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or
TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b000 & 0b0010 & 0b0000 & 0b010 \\
\end{array}
\]

if PSTATE.EL == EL0 then

D17.2.132  TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

### Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of HCR_EL2.E2H is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using TTBR0_EL2.
  - A higher VA range, translated using TTBR1_EL2.

### Configurations

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

### Attributes

TCR_EL2 is a 64-bit register.

### Field descriptions

**When HCR_EL2.E2H == 0:**

```
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9|  8|  7|  6|  5|  4|  3|  2|  1|  0 |

```

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:33]**

- Reserved, RES0.

**DS, bit [32]**

*When FEAT_LPA2 is implemented:*

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.

- **0b0**  Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1  Bits[49:48] of translation descriptors hold output address[49:48].
     Bits[9:8] of Translation table descriptors hold output address[51:50].
     The shareability information of Block and Page descriptors for cacheable locations is
determined by TCR_EL2.SH0.
     The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller
value generates a stage 1 level 0 translation table fault.
     All calculations of the stage 1 base address are modified for tables of fewer than 8
entries so that the table is aligned to 64 bytes.
     Bits[5:2] of TTBR0_EL2 are used to hold bits[51:48] of the output address in all cases.

Note
As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the
TCR_EL2.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so
that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of
BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of
BaseADDR are treated as 0b00.

Note
This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.
     The reset behavior of this field is:
     • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
     Reserved, RES0.

Bit [31]
     Reserved, RES1.

TCMA, bit [30]
When FEAT_MTE2 is implemented:
     Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.
     0b0  This control has no effect on the generation of Unchecked accesses.
     0b1  All accesses are Unchecked.
     The reset behavior of this field is:
     • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
     Reserved, RES0.

TBID, bit [29]
When FEAT_PAuth is implemented:
     Controls the use of the top byte of instruction addresses for address matching.
     For the purpose of this field, all cache maintenance and address translation instructions that perform
address translation are treated as data accesses.
     For more information, see Address tagging on page D8-5162.
     0b0  TCR_EL2.TBI applies to Instruction and Data accesses.
     0b1  TCR_EL2.TBI applies to Data accesses only.
     This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.
     The reset behavior of this field is:
     • On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1
translation table Block or Page entry.
0b0 Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware
for an IMPLEMENTATION DEFINED purpose.
0b1 Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware
for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1
translation table Block or Page entry.
0b0 Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware
for an IMPLEMENTATION DEFINED purpose.
0b1 Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware
for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1
translation table Block or Page entry.
0b0 Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware
for an IMPLEMENTATION DEFINED purpose.
0b1 Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware
for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

0b0  Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1  Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

0b0  Hierarchical permissions are enabled.

0b1  Hierarchical permissions are disabled.

Note

In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

0b0  Stage 1 hardware management of dirty state disabled.

0b1  Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

0b0  Stage 1 Access flag update disabled.

0b1  Stage 1 Access flag update enabled.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see *Address tagging on page D8-5162*.

- 0b0: Top Byte used in the address calculation.
- 0b1: Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

- 0b000: 32 bits, 4GB.
- 0b001: 36 bits, 64GB.
- 0b010: 40 bits, 1TB.
- 0b011: 42 bits, 4TB.
- 0b100: 44 bits, 16TB.
- 0b101: 48 bits, 256TB.
- 0b110: 52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]
Granule size for the TTBR0_EL2.

0b00  4KB.
0b01  64KB.
0b10  16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

0b00  Non-shareable.
0b10  Outer Shareable.
0b11  Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

0b00  Normal memory, Outer Non-cacheable.
0b01  Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10  Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11  Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

0b00  Normal memory, Inner Non-cacheable.
0b01  Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10  Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11  Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]
Reserved, RES0.
T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is 2^{64-T0SZ} bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.

0b0 Bits[49:48] of translation descriptors are RES0.

The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is 0b0000.

0b1 Bits[49:48] of translation descriptors hold output address[49:48].

Bits[9:8] of Translation table descriptors hold output address[51:50].
The shareability information of Block and Page descriptors for cacheable locations is determined by:

- TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2.
- TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2.

The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes.

Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases.

**Note**

As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

**Note**

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- **On a Warm reset, this field resets to an architecturally UNKNOWN value.**

**Otherwise:**

Reserved, RES0.

**TCMA1**, bit [58]

When **FEAT_MTE2** is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = \texttt{0b11111}.

\begin{itemize}
  \item \texttt{0b0} This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
  \item \texttt{0b1} All accesses are Unchecked.
\end{itemize}

**Note**

Software may change this control bit on a context switch.

The reset behavior of this field is:

- **On a Warm reset, this field resets to an architecturally UNKNOWN value.**

**Otherwise:**

Reserved, RES0.

**TCMA0**, bit [57]

When **FEAT_MTE2** is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = \texttt{0b00000}.

\begin{itemize}
  \item \texttt{0b0} This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
  \item \texttt{0b1} All accesses are Unchecked.
\end{itemize}
Note
Software may change this control bit on a context switch.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

E0PD1, bit [56]
When FEAT_E0PD is implemented:
Faulting control for Unprivileged access to any address translated by TTBR1_EL2.
0b0 Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.
0b1 Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

E0PD0, bit [55]
When FEAT_E0PD is implemented:
Faulting control for Unprivileged access to any address translated by TTBR0_EL2.
0b0 Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.
0b1 Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented or FEAT_TME is implemented:
Non-fault translation table walk disable for stage 1 translations using TTBR1_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL2.

If SVE is implemented, the affected access types include:
• All accesses due to an SVE non-fault contiguous load instruction.
• Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
• Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.
For more information, see FEAT_SVE.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

0b0  Does not disable stage 1 translation table walks using TTBR1_EL2.
0b1  A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:
•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented or FEAT_TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL2.

If SVE is implemented, the affected access types include:
•  All accesses due to an SVE non-fault contiguous load instruction.
•  Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
•  Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see FEAT_SVE.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

0b0  Does not disable stage 1 translation table walks using TTBR0_EL2.
0b1  A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:
•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see Address tagging on page D8-5162.

0b0  TCR_EL2.TB1 applies to Instruction and Data accesses.
0b1  TCR_EL2.TB1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

The reset behavior of this field is:
•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
TBID0, bit [51]

When FEAT_PAuth is implemented:
Controls the use of the top byte of instruction addresses for address matching.
For more information, see Address tagging on page D8-5162.
0b0   TCR_EL2.TBI0 applies to Instruction and Data accesses.
0b1   TCR_EL2.TBI0 applies to Data accesses only.
This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.
The reset behavior of this field is:
•   On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1
translation table Block or Page entry for translations using TTBR1_EL2.
0b0   For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or
       Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1   For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or
       Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the
       value of TCR_EL2.HPD1 is 1.
The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.
The reset behavior of this field is:
•   On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1
translation table Block or Page entry for translations using TTBR1_EL2.
0b0   For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or
       Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1   For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or
       Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the
       value of TCR_EL2.HPD1 is 1.
The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.
The reset behavior of this field is:
•   On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1
translation table Block or Page entry for translations using TTBR1_EL2.
0b0   For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or
       Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1 For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**HWU159, bit [47]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

0b0 For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**HWU062, bit [46]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

0b0 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**HWU061, bit [45]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

0b0 For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU060, bit [44]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

- **0b0** For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **0b1** For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU059, bit [43]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

- **0b0** For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **0b1** For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD1, bit [42]**

*When FEAT_HPDS is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

- **0b0** Hierarchical permissions are enabled.
- **0b1** Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HPD0, bit [41]

*When FEAT_HPDS is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

- 0b0: Hierarchical permissions are enabled.
- 0b1: Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

HD, bit [40]

*When FEAT_HAFDBS is implemented:*

Hardware management of dirty state in stage 1 translations from EL2.

- 0b0: Stage 1 hardware management of dirty state disabled.
- 0b1: Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

HA, bit [39]

*When FEAT_HAFDBS is implemented:*

Hardware Access flag update in stage 1 translations from EL2.

- 0b0: Stage 1 Access flag update disabled.
- 0b1: Stage 1 Access flag update enabled.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses.

For more information, see Address tagging on page D8-5162.

- 0b0: Top Byte used in the address calculation.
- 0b1: Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:
- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TBI0, bit [37]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see *Address tagging* on page D8-5162.

- 0b0  Top Byte used in the address calculation.
- 0b1  Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AS, bit [36]**

ASID Size.

- 0b0  8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
- 0b1  16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [35]**

Reserved, RES0.

**IPS, bits [34:32]**

Intermediate Physical Address Size.

- 0b000  32 bits, 4GB.
- 0b001  36 bits, 64GB.
- 0b010  40 bits, 1TB.
- 0b011  42 bits, 4TB.
- 0b100  44 bits, 16TB.
- 0b101  48 bits, 256TB.
- 0b110  When FEAT_LPA is implemented:
  - 52 bits, 4PB.

All other values are reserved.
The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG1, bits [31:30]**
Granule size for the TTBR1_EL2.
- 0b01 16KB.
- 0b10 4KB.
- 0b11 64KB.
Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.
It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH1, bits [29:28]**
Shareability attribute for memory associated with translation table walks using TTBR1_EL2.
- 0b00 Non-shareable.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.
Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN1, bits [27:26]**
Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.
- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN1, bits [25:24]**
Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL2.
- 0b00 Normal memory, Inner Non-cacheable.
0b01  Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10  Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11  Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EPD1, bit [23]**
Translation table walk disable for translations using TTBR1_EL2. This bit controls whether a
translation table walk is performed on a TLB miss, for an address that is translated using
TTBR1_EL2. The encoding of this bit is:
0b0  Perform translation table walks using TTBR1_EL2.
0b1  A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation
fault. No translation table walk is performed.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A1, bit [22]**
Selects whether TTBR0_EL2 or TTBR1_EL2 defines the ASID. The encoding of this bit is:
0b0  TTBR0_EL2.ASID defines the ASID.
0b1  TTBR1_EL2.ASID defines the ASID.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T1SZ, bits [21:16]**
The size offset of the memory region addressed by TTBR1_EL2. The region size is $2^{(64-T1SZ)}$ bytes.
The maximum and minimum possible values for T1SZ depend on the level of translation table and
the memory translation granule size, as described in the AArch64 Virtual Memory System
Architecture chapter.

--- Note ---
For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the
translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the
translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**
Granule size for the TTBR0_EL2.
0b00  4KB.
0b01  64KB.
0b10  16KB.

Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then
the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED
choice of the sizes that has been implemented for all purposes other than the value read back from
this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value
that corresponds to the size chosen.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

- 0b00 Non-shareable.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

- 0b0 Perform translation table walks using TTBR0_EL2.
- 0b1 A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region associated by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.
—— Note ———

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, TCR_EL2**

<table>
<thead>
<tr>

D17.2.133 TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

Reserved, RES0.

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.

0b0

Bits[49:48] of translation descriptors are RES0.

The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is 0b0000.

0b1

Bits[49:48] of translation descriptors hold output address[49:48].

Bits[9:8] of table translation descriptors hold output address[51:50].

The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL3.SH0.

The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.

Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases.
Note

As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

Note

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

0b0  This control has no effect on the generation of Unchecked accesses.

0b1  All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

0b0  TCR_EL3.TBI applies to Instruction and Data accesses.

0b1  TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

0b0  Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU61, bit [27]**

When **FEAT_HPDS2** is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

- 0b0: Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1: Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

When **FEAT_HPDS2** is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

- 0b0: Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1: Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

When **FEAT_HPDS2** is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

- 0b0: Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1: Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HPD, bit [24]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled.

--- Note ---

In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

- 0b0 Stage 1 hardware management of dirty state disabled.
- 0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL3.

- 0b0 Stage 1 Access flag update disabled.
- 0b1 Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.

- 0b0 Top Byte used in the address calculation.
- 0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.
If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see Address tagging on page D8-5162.

--- Note ---

This control determines the scope of address tagging. It never causes an exception to be generated.

---

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB</td>
</tr>
<tr>
<td>0b10</td>
<td>44 bits, 16TB</td>
</tr>
<tr>
<td>0b10</td>
<td>48 bits, 256TB</td>
</tr>
<tr>
<td>0b10</td>
<td>52 bits, 4PB</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL3.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>4KB</td>
</tr>
<tr>
<td>0b1</td>
<td>64KB</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB</td>
</tr>
</tbody>
</table>

Other values are reserved.
If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

- 0b00  Non-shareable.
- 0b10  Outer Shareable.
- 0b11  Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

- 0b00  Normal memory, Outer Non-cacheable.
- 0b01  Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10  Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11  Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

- 0b00  Normal memory, Inner Non-cacheable.
- 0b01  Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10  Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11  Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

--- Note ---

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing TCR_EL3**

Accesses to this register use the following encodings in the System register encoding space:

\[ MRS <Xt>, TCR_EL3 \]

<table>
<thead>
<tr>

D17.2.136  TFSR_EL2, Tag Fault Status Register (EL2)

The TFSR_EL2 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

**Configurations**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

**Attributes**

TFSR_EL2 is a 64-bit register.

**Field descriptions**

![Register Diagram]

**Bits [63:2]**

Reserved, RES0.

**TF1, bit [1]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

When HCR_EL2.E2H==0b0, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TF0, bit [0]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing TFSR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:
if PSTATE.EL == EL0 then
UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then

D17.2.139 TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configurations**

AArch64 System register TPIDR_EL0 bits [31:0] are architecturally mapped to AArch32 System register TPIDRURW[31:0].

**Attributes**

TPIDR_EL0 is a 64-bit register.

**Field descriptions**

```
+-------------+-------------+
| 63          | 32          |
| Thread ID   |             |
| [31:0]      |             |
```

**Bits [63:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing TPIDR_EL0**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <X>, TPIDR_EL0**

```
<table>

D17.2.144  TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0].

**Attributes**

TTBR0_EL1 is a 64-bit register.

**Field descriptions**

- **ASID**, bits [63:48]
  - An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.
  - If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.
  - The reset behavior of this field is:
    - On a Warm reset, this field resets to an architecturally UNKNOWN value.

- **BADDR[47:1]**, bits [47:1]
  - Translation table base address:
    - Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
    - Bits A[(x-1):0] of the stage 1 translation table base address are zero.
  - Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the translation stage, and the translation granule size.

  **Note**

  A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

  - If the value of TCR_EL1.IPS is not 0b110, then:
    - Register bits[(x-1):1] are RES0.
    - If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.
  - If FEAT_LPA is implemented and the value of TCR_EL1.IPS is 0b110, then:
    - Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
    - Register bit[1] is RES0.
• When \( x > 6 \), register bits\([(x-1):6]\] are \texttt{RES0}.

---

**Note**

TCR_EL1.IPS==0b110 is permitted when:

- \texttt{FEAT_LPA} is implemented and the 64KB translation granule is used.
- \texttt{FEAT_LPA2} is implemented and the 4KB or 16KB translation granule is used.

When the value of \texttt{ID_AA64MMFR0_EL1.PARange} indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of TCR_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

---

If any register bit[47:1] that is defined as \texttt{RES0} has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are 

\texttt{CONSTRAINED UNPREDICTABLE}, and must be one of the following:

- Bits \( A[(x-1):0] \) of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**CnP, bit [0]**

*When \texttt{FEAT_TTCNP} is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

\begin{itemize}
  \item \texttt{0b0} The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:
    \begin{itemize}
      \item The value of TTBR0_EL1.CnP on those other PEs.
      \item The value of the current ASID.
      \item If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
    \end{itemize}
  \item \texttt{0b1} The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:
    \begin{itemize}
      \item The translation table entries are pointed to by TTBR0_EL1.
      \item The translation tables relate to the same translation regime.
      \item The ASID is the same as the current ASID.
      \item If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
    \end{itemize}
\end{itemize}

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.
Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see CONstrained UNpredictable behaviors due to caching of control or data values on page K1-11585.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D17.2.145   TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

**Purpose**

When \( \text{HCR\_EL2.E2H} \) is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When \( \text{HCR\_EL2.E2H} \) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2\&0 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register HTTBR[47:1].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR0_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASID</td>
<td>Bits [63:48]</td>
</tr>
<tr>
<td>BADDR[47:1]</td>
<td>Translation table base address:</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

*When FEAT\_VHE is implemented:*

When \( \text{HCR\_EL2.E2H} \) is 0, this field is RES0.

When \( \text{HCR\_EL2.E2H} \) is 1, it holds an ASID for the translation table base address. The TCR\_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL2.T0SZ, the translation stage, and the translation granule size.
A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL2.{I}PS is not 0b110, then:
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL2.{I}PS is 0b110, then:
- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x=6, register bits[(x-1):6] are RES0.

The OA size specified by TCR_EL2.{I}PS is determined as follows:
- The value of TCR_EL2.PS when the value of HCR_EL2.E2H is 0.
- The value of TCR_EL2.IPS when the value of HCR_EL2.E2H is 1.

TCR_EL2.{I}PS==0b110 is permitted when:
- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of TCR_EL2.{I}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:
- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

0b0 The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
- The value of TTBR0_EL2.CnP on those other PEs.
- When the current translation regime is the EL2&0 regime, the value of the current ASID.
The translation table entries pointed to by TTBR0_EL2 are the same as the translation
table entries for every other PE in the Inner Shareable domain for which the value of
TTBR0_EL2.CnP is 1 and all of the following apply:

• The translation table entries are pointed to by TTBR0_EL2.
• The translation tables relate to the same translation regime.
• If that translation regime is the EL2&0 regime, the ASID is the same as the
current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain
and those TTBR0_EL2s do not point to the same translation table entries when the other conditions
specified for the case when the value of CnP is 1 apply, then the results of translations are
CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching
of control or data values on page K1-11585.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2
or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS } <Xt>, \text{ TTBR0_EL2}
\]

\[
\begin{array}{cccccc}

D17.2.146 TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

**Attributes**

TTBR0_EL3 is a 64-bit register.

**Field descriptions**

- **Bits [63:48]**
  - Reserved, RES0.

- **BADDR[47:1], bits [47:1]**
  - Translation table base address:
    - Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
    - Bits A[(x-1):0] of the stage 1 translation table base address are zero.
  - Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the translation stage, and the translation granule size.

  ——— Note ———

  A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

  ——— Note ———

  If the value of TCR_EL3.PS is not 0b110, then:
  - Register bits[(x-1):1] are RES0.
  - If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

  If FEAT_LPA is implemented and the value of TCR_EL3.PS is 0b110, then:
  - Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
  - Register bit[1] is RES0.
  - When x>6, register bits[(x-1):6] are RES0.

  ——— Note ———

  TCR_EL3.PS==0b110 is permitted when:
  - FEAT_LPA is implemented and the 64KB translation granule is used.
• **FEAT_LPA2** is implemented and the 4KB or 16KB translation granule is used.

When the value of **ID_AA64MMFR0_EL1.PARange** indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of **TCR_EL3.PS** is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are **CONSTRAINED UNPREDICTABLE**, and must be one of the following:

• Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.

• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CnP, bit [0]**

*When FEAT_TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

0b0 The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.

0b1 The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This bit is permitted to be cached in a TLB.

**Note**

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are **CONSTRAINED UNPREDICTABLE**, see **CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values** on page K1-11585.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

  TTBR0_EL3 = X[t, 64];
TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

**Attributes**

TTBR1_EL1 is a 64-bit register.

**Field descriptions**

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the translation stage, and the translation granule size.

--- Note ---

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL1.IPS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL1.IPS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
• When x>6, register bits[(x-1):6] are RES0.

**Note**

TCR_EL1.IPS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of TCR_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are constrained unpredictable, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally unknown value.

**CnP, bit [0]**

*When FEAT_TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TTBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

0b0 The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR1_EL1.CnP on those other PEs.
- The value of the current ASID.
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

0b1 The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:

- The translation table entries are pointed to by TTBR1_EL1.
- The translation tables relate to the same translation regime.
- The ASID is the same as the current ASID.
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.
--- Note ---

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-11585.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing TTBR1_EL1**

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D17.2.148  TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

--- Note ---

When HCR_EL2.E2H is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

**Configurations**

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR1_EL2 is a 64-bit register.

**Field descriptions**

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are **RES0**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the translation stage, and the translation granule size.

--- Note ---

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.
If the value of `TCR_EL2.{i}PS` is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

If `FEAT_LPA` is implemented and the value of `TCR_EL2.{i}PS` is `0b110`, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

---

**Note**

The OA size specified by `TCR_EL2.{i}PS` is determined as follows:

- The value of `TCR_EL2.PS` when the value of `HCR_EL2.E2H` is 0.
- The value of `TCR_EL2.IPS` when the value of `HCR_EL2.E2H` is 1.

`TCR_EL2.{i}PS==0b110` is permitted when:

- `FEAT_LPA` is implemented and the 64KB translation granule is used.
- `FEAT_LPA2` is implemented and the 4KB or 16KB translation granule is used.

When the value of `ID_A64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of `TCR_EL2.{i}PS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

---

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

---

**CnP, bit [0]**

*When FEAT_TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

*0b0* The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR1_EL2.CnP on those other PEs.
- The value of the current ASID.

*0b1* The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply:

- The translation table entries are pointed to by TTBR1_EL2.
- The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.
Note

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-11585.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

    elsif EL2Enabled() && (HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWRTR_EL2.VBAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x250] = X[t, 64];
    else
        VBAR_EL1 = X[t, 64];
    elsif PSTATE.EL == EL2 then
        if HCR_EL2.E2H == '1' then
            VBAR_EL2 = X[t, 64];
        else
            VBAR_EL1 = X[t, 64];
    elsif PSTATE.EL == EL3 then
        VBAR_EL1 = X[t, 64];
D17.2.151 VBAR_EL3, Vector Base Address Register (EL3)

The VBAR_EL3 characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to EL3.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to VBAR_EL3 are UNDEFINED.

**Attributes**

VBAR_EL3 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:11]</td>
<td>Vector Base Address</td>
</tr>
<tr>
<td>[10:0]</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Notes**

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing VBAR_EL3**

Accesses to this register use the following encodings in the System register encoding space:
**MRS <Xt>, VBAR_EL3**

```assembly
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = VBAR_EL3;
```

**MSR VBAR_EL3, <Xt>**

```assembly
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    VBAR_EL3 = X[t, 64];
```
D17.2.152  VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of MPIDR_EL1.

**Configurations**

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VMPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VMPIDR_EL2 is a 64-bit register.

**Field descriptions**

![Register Layout]

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

0b0  Processor is part of a multiprocessor system.

0b1  Processor is part of a uniprocessor system.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [29:25]**

Reserved, RES0.
MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

- **0b0** Performance of PEs at the lowest affinity level is largely independent.
- **0b1** Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Aff2, bits [23:16]**

Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Aff1, bits [15:8]**

Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior.

The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing VMPIDR_EL2**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, VMPIDR_EL2**

D17.2.153 VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

**Purpose**

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

**Configurations**

This register is present only when FEAT_NV2 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VNCR_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-53</td>
<td>RESS</td>
</tr>
<tr>
<td>52-12</td>
<td>BADDR</td>
</tr>
<tr>
<td>11-0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**RESS, bits [63:53]**

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

**BADDR, bits [52:12]**

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:0]**

Reserved, RES0.

**Accessing VNCR_EL2**

Accesses to this register use the following encodings in the System register encoding space:
**MRS <Xt>, VNCR_EL2**

```
if PSTATE_EL == EL0 then
    UNDEFINED;
elsif PSTATE_EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x0B0];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE_EL == EL2 then

elsif PSTATE_EL == EL3 then
    X[t, 64] = VNCR_EL2;
```

**MSR VNCR_EL2, <Xt>**

```
if PSTATE_EL == EL0 then
    UNDEFINED;
elsif PSTATE_EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x0B0] = X[t, 64];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE_EL == EL2 then
    VNCR_EL2 = X[t, 64];
elsif PSTATE_EL == EL3 then
    VNCR_EL2 = X[t, 64];
```
D17.2.154  VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of MIDR_EL1.

**Configurations**

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VPIDR_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>23</td>
<td>Implementer</td>
</tr>
<tr>
<td>19</td>
<td>Variant</td>
</tr>
<tr>
<td>15</td>
<td>PartNum</td>
</tr>
<tr>
<td>0</td>
<td>Revision</td>
</tr>
</tbody>
</table>

Bits [63:32] Reserved, RES0.

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

- 0x00 Reserved for software use.
- 0x41 Arm Limited.
- 0x42 Broadcom Corporation.
- 0x43 Cavium Inc.
- 0x44 Digital Equipment Corporation.
- 0x46 Fujitsu Ltd.
- 0x49 Infineon Technologies AG.
- 0x4D Motorola or Freescale Semiconductor Inc.
- 0x4E NVIDIA Corporation.
- 0x50 Applied Micro Circuits Corporation.
- 0x51 Qualcomm Inc.
- 0x56 Marvell International Ltd.
- 0x69 Intel Corporation.
- 0xC0 Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Architecture, bits [19:16]**

Architecture version. Defined values are:

- 0b0001  Armv4.
- 0b0010  Armv4T.
- 0b0011  Armv5 (obsolete).
- 0b0100  Armv5T.
- 0b0101  Armv5TE.
- 0b0110  Armv5TEJ.
- 0b0111  Armv6.
- 0b1111  Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing VPIDR_EL2**

D17.2.155  VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the Secure EL1&0 translation regime.

**Configurations**

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSTCR_EL2 is a 64-bit register.

**Field descriptions**

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:34]**

Reserved, RES0.

**SL2, bit [33]**

When FEAT_LPA2 is implemented:

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

- If VTCR_EL2.DS == 1, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.
- If VTCR_EL2.DS == 0, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**SA, bit [30]**

Secure stage 2 translation output address space.

- 0b0  All stage 2 translations for the Secure IPA space access the Secure PA space.
- 0b1  All stage 2 translations for the Secure IPA space access the Non-secure PA space.
When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SW, bit [29]**

Secure stage 2 translation address space.

- 0b0: All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.
- 0b1: All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [28:16]**

Reserved, RES0.

**TG0, bits [15:14]**

Secure stage 2 granule size for VSTTBR_EL2.

- 0b00: 4KB.
- 0b01: 64KB.
- 0b10: 16KB.

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [13:8]**

Reserved, RES0.

**SL0, bits [7:6]**

*When FEAT_TTST is implemented:*

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

- 0b00: If VSTCR_EL2.TG0 is 0b00 (4KB granule):
  - If FEAT_LPA2 is not implemented, start at level 0.
  - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2.
  - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1.
  - If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

- 0b01: If VSTCR_EL2.TG0 is 0b00 (4KB granule):
  - If FEAT_LPA2 is not implemented, start at level 1.
  - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1.
If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved.

If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10
- If VSTCR_EL2.TG0 is 0b00 (4KB granule):
  - If FEAT_LPA2 is not implemented, start at level 0.
  - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0.
  - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved.

If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

0b11
- If VSTCR_EL2.TG0 is not implemented, start at level 3.
- If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3.
- If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved.

If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

0b00
- If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01
- If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10
- If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by VSTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

--- Note ---

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTCR_EL2
Accesses to this register use the following encodings in the System register encoding space:

D17.2.156 VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

**Purpose**

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

**Configurations**

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSTTBR_EL2 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:48]</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
Note

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of VTCR_EL2.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of VTCR_EL2.PS is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VSTTBR_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[(x-1):0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VSTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

0b0 The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.

0b1 The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-11585.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D17.2.157 VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the EL1&0 translation regime.

**Configurations**

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTCR_EL2 is a 64-bit register.

**Field descriptions**

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:34]**

Reserved, RES0.

**SL2, bit [33]**

*When FEAT_LPA2 is implemented:*

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DS, bit [32]**

*When FEAT_LPA2 is implemented:*

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 2 of the EL1&0 translation regime.

0b0: Bits[49:48] of translation descriptors are RES0.

The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.

The minimum value of VSTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.

Output address[51:48] is 0000.

0b1 Bits[49:48] of translation descriptors hold output address[49:48].

Bits[9:8] in translation descriptors hold output address[50:48].

The shareability information of Block and Page descriptors for cacheable locations is determined by VTCR_EL2.SH0.

The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.

The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.

--- Note ---

As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension.

--- Note ---

For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.

--- Note ---

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

NSA, bit [30]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation output address space for the Secure EL1&0 translation regime.

0b0 All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space.

0b1 All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space.

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
NSW, bit [29]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation table address space for the Secure EL1&0 translation regime.

0b0  All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space.

0b1  All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

0b0  Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1  Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

0b0  Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1  Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

0b0  Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1  Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally UNKNOWN value.
**HWU59, bit [25]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

- **0b0**: Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **0b1**: Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:23]**

Reserved, RES0.

**HD, bit [22]**

*When FEAT_HAFDBS is implemented:*

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

- **0b0**: Stage 2 hardware management of dirty state disabled.
- **0b1**: Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

*When FEAT_HAFDBS is implemented:*

Hardware Access flag update in stage 2 translations when EL2 is enabled in the current Security state.

- **0b0**: Stage 2 Access flag update disabled.
- **0b1**: Stage 2 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**VS, bit [19]**

*When FEAT_VMID16 is implemented:*

VMID Size.

- **0b0**: 8-bit VMID. The upper 8 bits of VTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.
0b1 16-bit VMID. The upper 8 bits of VTTBR_EL2 are used for allocation and matching in the TLB.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PS, bits [18:16]
Physical address Size for the second stage of translation.
- 0b000 32 bits, 4GB.
- 0b001 36 bits, 64GB.
- 0b010 40 bits, 1TB.
- 0b011 42 bits, 4TB.
- 0b100 44 bits, 16TB.
- 0b101 48 bits, 256TB.
- 0b110 52 bits, 4PB.
All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]
Granule size for the VTTBR_EL2.
- 0b0 4KB.
- 0b1 64KB.
- 0b10 16KB.
Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

- \texttt{0b00} Non-shareable.
- \texttt{0b10} Outer Shareable.
- \texttt{0b11} Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is \textit{CONSTRAINED UNPREDICTABLE}.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

- \texttt{0b00} Normal memory, Outer Non-cacheable.
- \texttt{0b01} Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- \texttt{0b10} Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- \texttt{0b11} Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

- \texttt{0b00} Normal memory, Inner Non-cacheable.
- \texttt{0b01} Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- \texttt{0b10} Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- \texttt{0b11} Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

SL0, bits [7:6]

\textit{When FEAT\_TTST is implemented:}

Starting level of the stage 2 translation lookup, controlled by VTCR\_EL2. The meaning of this field depends on the value of VTCR\_EL2.TG0.

- \texttt{0b00} If VTCR\_EL2.TG0 is \texttt{0b00} (4KB granule):
  - If \texttt{FEAT\_LPA2} is not implemented, start at level 2.
  - If \texttt{FEAT\_LPA2} is implemented and VTCR\_EL2.SL2 is \texttt{0b0}, start at level 2.
  - If \texttt{FEAT\_LPA2} is implemented and VTCR\_EL2.SL2 is \texttt{0b1}, start at level -1.

- \texttt{0b01} If VTCR\_EL2.TG0 is \texttt{0b01} (4KB granule):
  - If \texttt{FEAT\_LPA2} is not implemented, start at level 1.
  - If \texttt{FEAT\_LPA2} is implemented and VTCR\_EL2.SL2 is \texttt{0b0}, start at level 1.
  - If \texttt{FEAT\_LPA2} is implemented, the combination of VTCR\_EL2.SL0 == 01 and VTCR\_EL2.SL2 == 1 is reserved.

- \texttt{0b10} If VTCR\_EL2.TG0 is \texttt{0b10} (16KB granule) or \texttt{0b11} (64KB granule), start at level 2.
• If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 0.
• If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved.
If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

If VTCR_EL2.TG0 is 0b11 (4KB granule):
• If FEAT_LPA2 is not implemented, start at level 3.
• If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3.
• If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved.
If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

• If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3.
• If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved.
If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]
The size offset of the memory region addressed by VTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.
The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in Chapter D8 The AArch64 Virtual Memory System Architecture.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

--- Note ---
For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

---

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR_EL2
Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

D17.2.158 VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTTBR_EL2 is a 64-bit register.

**Field descriptions**

**VMID, bits [63:48]**

VMID encoding when FEAT_VMID16 is implemented and VTCR_EL2.VS == 1

**VMID, bits [15:0]**

The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VMID, bits [15:0]**

The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.

**VMID, bits [7:0]**

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- **FEAT_VMID16** is not implemented.
  The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

--- **Note**

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes **FEAT_LPA**, if the value of **VTCR_EL2.PS** is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes **FEAT_TTCNP**, bit[0] of the stage 1 translation table base address is zero.

--- **Note**

When the value of **ID_AA64MMFR0_EL1.PARange** indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the **Effective value** of **VTCR_EL2.PS** is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of **VTCR_EL2.PS** is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any **VTTBR_EL2[47:0]** bit that is defined as RES0 has the value 1 when a translation table walk is performed using **VTTBR_EL2**, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of **VTCR_EL2.T0SZ**, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
CnP, bit [0]

**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

0b0  The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.

0b1  The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

--- **Note** ---

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see **CONSTRANED UNPREDICTABLE behaviors due to caching of control or data values on page K1-11585**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

Accessing VTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

D17.2.159 ZCR_EL1, SVE Control Register (EL1)

The ZCR_EL1 characteristics are:

**Purpose**

This register controls aspects of SVE visible at Exception levels EL1 and EL0.

**Configurations**

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are UNDEFINED.

This register has no effect when FEAT_SME is implemented and the PE is in Streaming SVE mode.

When HCR_EL2.{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, this register has no effect on execution at EL0.

**Attributes**

ZCR_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit 63</th>
<th>Bit 32</th>
<th>Bit 31</th>
<th>Bit 9</th>
<th>Bit 8</th>
<th>Bit 4</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>RAZ/WI</td>
<td>LEN</td>
<td>LEN</td>
<td>LEN</td>
<td>LEN</td>
</tr>
</tbody>
</table>

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL1 of (LEN+1)*128 bits. This field also defines the Effective Non-streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or HCR_EL2.{E2H,TGE} is not {1,1}.

The Non-streaming SVE vector length can be any multiple of 128 bits, from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See SMCR_EL1.

For all purposes other than returning the result of a direct read of ZCR_EL1, the PE selects the Effective Non-streaming SVE vector length by performing checks in the following order:

1. If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.
2. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
3. Otherwise, the Effective length is the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D17.2.160  ZCR_EL2, SVE Control Register (EL2)

The ZCR_EL2 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL2, EL1, and EL0.

Configurations

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are UNDEFINED.

This register has no effect when EL2 is not enabled in the current Security state, or when FEAT_SME is implemented and the PE is in Streaming SVE mode.

Attributes

ZCR_EL2 is a 64-bit register.

Field descriptions

<table>
<thead>
<tr>

<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:9</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8:4</td>
<td>Reserved, RAZ/WI</td>
</tr>
<tr>
<td>3:0</td>
<td>LEN</td>
</tr>
</tbody>
</table>

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL2 of (LEN+1)*128 bits. This field also defines the Effective Non-streaming SVE vector length at EL0 when EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H,TGE} is {1,1}.

The Non-streaming SVE vector length can be any multiple of 128 bits, from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See SMCR_EL2.

For all purposes other than returning the result of a direct read of ZCR_EL2, the PE selects the Effective Non-streaming SVE vector length by performing checks in the following order:

1. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
2. Otherwise, the Effective length is the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing ZCR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D17.3 Debug registers

This section lists the Debug System registers in AArch64 state, in alphabetic order:

- The principal encoding space for debug registers is \( \text{op0} = \text{0b10}, \text{op1} = \{0, 3, 4\} \). *Instructions for accessing debug System registers on page D16-5519* summarizes the registers in this encoding space and lists them in order of their encodings.

- In addition, the following registers in the \( \text{op0} = \text{0b11} \) encoding space are classified as Debug registers:
  - DLR_EL0.
  - DSPSR_EL0.
  - MDCR_EL2.
  - MDCR_EL3.
  - SDER32_EL3.
D17.3.1  DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configurations**

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

**Attributes**

DBGAUTHSTATUS_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

0b00  Not implemented.

0b10  Implemented and disabled.

`ExternalRootInvasiveDebugEnabled () == FALSE.`

0b11  Implemented and enabled.

`ExternalRootInvasiveDebugEnabled () == TRUE.`

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

0b00  Not implemented.
0b10  Implemented and disabled.
      ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled.
      ExternalRealmInvasiveDebugEnabled() == TRUE.
All other values are reserved.
If FEAT_RME is not implemented, the only permitted value is 00.

Bits [11:8]
      Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:
      Secure non-invasive debug.
      This field has the same value as DBGAUTHSTATUS_EL1.SID.
Otherwise:
      Secure non-invasive debug.
0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10  Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.
All other values are reserved.

SID, bits [5:4]
      Secure invasive debug.
0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10  Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.
All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:
      Non-secure non-invasive debug.
0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11  Implemented and enabled. EL3 is implemented or the Effective value of SCR_EL3.NS is 1.
All other values are reserved.
Otherwise:
      Non-secure non-invasive debug.
0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10  Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.
All other values are reserved.

NSID, bits [1:0]
      Non-secure invasive debug.
0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10  Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.
All other values are reserved.
Accessing DBGAUTHSTATUS_EL1

Accesses to this register use the following encodings in the System register encoding space:

\[ MRS \langle Xt\rangle, \text{DBGAUTHSTATUS\_EL1} \]

D17.3.2  DBGBCR<\textit{n}>_EL1, Debug Breakpoint Control Registers, \(n = 0 \text{ - } 15\)

The DBGBCR<\textit{n}>_EL1 characteristics are:

### Purpose

Holds control information for a breakpoint. Forms breakpoint \(n\) together with value register DBGBVR<\textit{n}>_EL1.

### Configurations

AArch64 System register DBGBCR<\textit{n}>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<\textit{n}>[31:0].

AArch64 System register DBGBCR<\textit{n}>_EL1 bits [31:0] are architecturally mapped to External register DBGBCR<\textit{n}>_EL1[31:0].

If breakpoint \(n\) is not implemented, accesses to this register are UNDEFINED.

### Attributes

DBGBCR<\textit{n}>_EL1 is a 64-bit register.

### Field descriptions

#### Bits [63:30]

Reserved, RES0.

#### SSCE, bit [29]

*When FEAT_RME is implemented:*

Security State Control Extended.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

#### Bits [28:24]

Reserved, RES0.

#### BT, bits [23:20]

Breakpoint Type. Possible values are:

- **0b0000**: Unlinked instruction address match. DBGBVR<\textit{n}>_EL1 is the address of an instruction.

- **0b0001**: As 0b0000, but linked to a Context matching breakpoint.
0b0010  Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.

0b0011  As 0b0010, with linking enabled.

0b0110  Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.

0b0111  As 0b0110, with linking enabled.

0b1000  Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.

0b1001  As 0b1000, with linking enabled.

0b1010  Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.

0b1011  As 0b1010, with linking enabled.

0b1100  Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.

0b1101  As 0b1100, with linking enabled.

0b1110  Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.

0b1111  As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-4717.

For more information on the effect of programming the fields to a reserved value, see Reserved DBGBCR<n>_EL1.BT values on page D2-4722.

The reset behavior of this field is:

•  On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behavior of this field is:

•  On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.
For more information on the operation of these fields, see \textit{Execution conditions for which a breakpoint generates Breakpoint exceptions} on page D2-4717.

For more information on the effect of programming the fields to a reserved set of values, see \textit{Reserved DBGBCR\textless n\textgreater _EL1.(SSC, HMC, PMC) values} on page D2-4722.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textbf{HMC, bit [13]}

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint \textit{n} is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see \textit{Execution conditions for which a breakpoint generates Breakpoint exceptions} on page D2-4717.

For more information, see DBGBCR\textless n\textgreater _EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textbf{Bits [12:9]}

Reserved, \textbf{RES0}.

\textbf{BAS, bits [8:5]}

\textit{When AArch32 is supported:}

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR\textless n\textgreater _EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b100</td>
<td>DBGBVR\textless n\textgreater _EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR\textless n\textgreater _EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see \textit{Reserved DBGBCR\textless n\textgreater _EL1.BAS values} on page D2-4723.

For more information on using the BAS field in address match breakpoints, see \textit{Using the BAS field in Address Match breakpoints} on page G2-9067.

For Context matching breakpoints, this field is \textbf{RES1} and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textit{Otherwise:}

Reserved, \textbf{RES1}.

\textbf{Bits [4:3]}

Reserved, \textbf{RES0}. 

For more information on the operation of these fields, see \textit{Execution conditions for which a breakpoint generates Breakpoint exceptions} on page D2-4717.
PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-4717.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1.

0b0 Breakpoint disabled.

0b1 Breakpoint enabled.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGBCR<m>_EL1

D17.3.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

**Configurations**

AArch64 System register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

If the breakpoint is context-aware and EL2 is implemented then AArch64 System register DBGVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>. Otherwise, there is no System register access to DBGBVR<n>_EL1[63:32] from AArch32 state.

AArch64 System register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:0].

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is 0b000x, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is 0b001x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGBVR<n>_EL1 is a 64-bit register.

**Field descriptions**

*When DBGBCR<n>_EL1.BT == 0b000x:*

<table>
<thead>
<tr>
<th>63</th>
<th>53</th>
<th>49</th>
<th>48</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RESS[14:4]</strong></td>
<td><strong>VA[48:2]</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.
VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

VA[52:49]
Extension to VA[48:2]. For more information, see VA[48:2].
The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]
Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.
When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.
The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]
Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

Bits [63:32]
Reserved, RES0.

ContextID, bits [31:0]
Context ID value for comparison.
The value is compared against CONTEXTIDR_EL2 when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), HCR_EL2.E2H is 1, and either:
- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR_EL1.
The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
**When DBGBCR<\text{n}>_EL1.BT == 0b011x:**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Reset Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>[31:0]</td>
<td>ContextID</td>
<td>Context ID value for comparison against CONTEXTIDR_EL1. On a Cold reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

**When DBGBCR<\text{n}>_EL1.BT == 0b100x and EL2 is implemented:**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Reset Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:48]</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>[47:40]</td>
<td>VMID[15:8]</td>
<td>Extension to VMID[7:0]. For more information, see DBGBVR&lt;\text{n}&gt;_EL1.VMID[7:0]. On a Cold reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>[39:32]</td>
<td>VMID[7:0]</td>
<td>VMID value for comparison. The VMID is 8 bits when any of the following are true: EL2 is using AArch32, VTCR_EL2.VS is 0, FEAT_VMID16 is not implemented. On a Cold reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>[31:0]</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
</tbody>
</table>
When DBGBCR<\textgreater n\textless>_EL1.BT == 0b101x and EL2 is implemented:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:48</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47:40</td>
<td>VMID[15:8]</td>
</tr>
<tr>
<td>39:32</td>
<td>VMID[7:0]</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see DBGVR<\textgreater n\textless>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<\textgreater n\textless>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>ContextID2</td>
</tr>
<tr>
<td>31:0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.
When DBGBCR\textsubscript{\textit{n}}\_EL1.BT == 0b111\textit{x}, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):

**ContextID2**, bits [63:32]
Context ID value for comparison against CONTEXTIDR\_EL2.
The reset behavior of this field is:
* On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ContextID**, bits [31:0]
Context ID value for comparison against CONTEXTIDR\_EL1.
The reset behavior of this field is:
* On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing DBGBVR\textsubscript{\textit{n}}\_EL1**
Accesses to this register use the following encodings in the System register encoding space:

---

MSR DBGBVR<m>_EL1, <Xt>
D17.3.4 DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

--- Note

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configurations**

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR_EL1 is a 64-bit register.

**Field descriptions**

```
| 63 | 32 | RES0 |
| 31 | 8  | RAZ/WI |
| 7  | 0  | CLAIM |
```

**Bits [63:32]**

Reserved, RES0.

**Bits [31:8]**

Reserved, RAZ/WI.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits. Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

**Accessing DBGCLAIMCLR_EL1**

Accesses to this register use the following encodings in the System register encoding space:
### MRS <Xt>, DBGCLAIMCLR_EL1

<table>

D17.3.5 DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.
The architecture does not define any functionality for the CLAIM tag bits.

--- **Note** ---

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMCLR_EL1 register.

**Configurations**

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].
AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].
An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31:8</td>
<td>Reserved, RAZ/WI.</td>
</tr>
<tr>
<td>7:0</td>
<td>CLAIM</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.
This field is RAO.
Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.
Writing 0 to one of these bits has no effect.

D17.3.6  **DBGDTR_EL0, Debug Data Transfer Register, half-duplex**

The DBGDTR_EL0 characteristics are:

**Purpose**

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

**Configurations**

- AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when written.
- AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when written.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when written.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when written.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when written.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when written.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when read.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when read.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when read.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when read.
- AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when read.

**Attributes**

DBGDTR_EL0 is a 64-bit register.

**Field descriptions**

![HighWord, bits [63:32]](image)

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRTX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.
**LowWord, bits [31:0]**

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:
- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

### Accessing DBGDTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

D17.3.7 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configurations**

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

**Attributes**

DBGDTRRX_EL0 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
<td>Update DTRRX</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Update DTRRX.

Reads of this register:
- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing DBGDTRRX_EL0**

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS} <Xt>, \text{DBGDTRRX}_\text{EL0}
\]

<table>

**D17.3.8 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit**

The DBGDTRTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configurations**

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

**Attributes**

DBGDTRTX_EL0 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[31:0]</td>
<td>Return DTRTX</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Return DTRTX.

Writes to this register:
- If TXfull is set to 1, set DTRRX and DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing DBGDTRTX_EL0**

Accesses to this register use the following encodings in the System register encoding space:

**MSR DBGDTRTX_EL0, <Xt>**

D17.3.9 DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Configurations**

AArch64 System register DBGPRCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGPRCR[31:0].

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

**Attributes**

DBGPRCR_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:1]

Reserved, RES0.

CORENPDRQ, bit [0]

*When FEAT_DoPD is implemented:*

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states on page H6-10336.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.
Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

- **0b0** If the system responds to a powerdown request, it powers down Core power domain.
- **0b1** If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDRCCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states on page H6-10336.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDRCCR.COREPURQ.

D17.3.10  DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configurations**

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DBGVCR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGVCR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

**Attributes**

DBGVCR32_EL2 is a 64-bit register.

**Field descriptions**

*When EL3 is implemented:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Offset</th>

</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1c.

The reset behavior of this field is:

* • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

* • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort exception vector catch enable in Non-secure state.

The exception vector offset is 0x10.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSP, bit [27]**
Prefetch Abort vector catch enable in Non-secure state.
The exception vector offset is 0x0C.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSS, bit [26]**
Supervisor Call (SVC) vector catch enable in Non-secure state.
The exception vector offset is 0x08.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSU, bit [25]**
Undefined Instruction vector catch enable in Non-secure state.
The exception vector offset is 0x04.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [24:8]**
Reserved, RES0.

**SF, bit [7]**
FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [6]**
IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**
Reserved, RES0.

**SD, bit [4]**
Data Abort exception vector catch enable in Secure state.
The exception vector offset is 0x10.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SP, bit [3]**
Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
SS, bit [2]
Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]
Undefined Instruction vector catch enable in Secure state.
The exception vector offset is 0x04.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]
Reserved, RES0.

When EL3 is not implemented:

Bits [63:8]
Reserved, RES0.

F, bit [7]
FIQ vector catch enable.
The exception vector offset is 0x1C.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]
IRQ vector catch enable.
The exception vector offset is 0x18.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]
Reserved, RES0.

D, bit [4]
Data Abort exception vector catch enable.
The exception vector offset is 0x10.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]
Prefetch Abort vector catch enable.
The exception vector offset 0x0C.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]
Supervisor Call (SVC) vector catch enable.
The exception vector offset is 0x08.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]
Undefined Instruction vector catch enable.
The exception vector offset is 0x04.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]
Reserved, RES0.

D17.3.11  DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configurations

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>29</td>
<td>SSCE, bit [29]</td>
</tr>
</tbody>
</table>
| 28  | When FEAT_RME is implemented: Security State Control Extended.  
     Security State Control Extended.  
     The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE.  
     These fields must be considered in combination, and the values that are permitted for these fields are constrained.  
     The reset behavior of this field is:  
     * On a Cold reset, this field resets to an architecturally UNKNOWN value. |
| 24  | MASK, bits [28:24] |
| 28  | Address mask. Only objects up to 2GB can be watched using a single mask.  
     0b00000  No mask.  
     0b00001  Reserved.  
     0b00010  Reserved.  
     If programmed with a reserved value, a watchpoint must behave as if either:  
     * MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.  
     * The watchpoint is disabled. |
Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:
- 0b0 Unlinked data address match.
- 0b1 Linked data address match.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-4728.

For more information on the effect of programming the fields to a reserved value, see Reserved DBGWCR<\a>_EL1.(SSC, HMC, PAC) values on page D2-4737.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-4728.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxx1</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1</td>
</tr>
<tr>
<td>xxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 1</td>
</tr>
<tr>
<td>xxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 2</td>
</tr>
<tr>
<td>xxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n>_EL1 addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;_EL1[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 4</td>
</tr>
<tr>
<td>xx1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 5</td>
</tr>
<tr>
<td>x1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 6</td>
</tr>
<tr>
<td>1xxxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 7</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See Reserved DBGWCR<n>_EL1.BAS values on page D2-4738.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:
- 0b01 Match instructions that load from a watchpointed address.
- 0b10 Match instructions that store to a watchpointed address.
- 0b11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-4728.
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [0]**

Enable watchpoint n. Possible values are:

- 0b0  Watchpoint disabled.
- 0b1  Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

D17.3.12 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configurations

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].
AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGWVR<n>_EL1[63:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- It is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

VA[52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing DBGWVR\(n\)_EL1**

Accesses to this register use the following encodings in the System register encoding space:

**MRS \(X_t\), DBGWVR\(m\)_EL1**

D17.3.14 DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configurations

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DSPSR[31:0].

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

When AArch32 is supported and exiting Debug state to AArch32 state:

Bits [63:32]
Reserved, RES0.

N, bit [31]
Negative Condition flag. Copied to PSTATE.N on exiting Debug state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]
Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]
Carry Condition flag. Copied to PSTATE.C on exiting Debug state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]
Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]
Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT, bits [15:10, 26:25]**
If-Then. Copied to PSTATE.IT on exiting Debug state.
DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.
The IT field is split as follows:
- IT[1:0] is DSPSR_EL0[26:25].
- IT[7:2] is DSPSR_EL0[15:10].
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIT, bit [24]**

*When FEAT_DIT is implemented:*
Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*
Reserved, RES0.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*
Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*
Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*
Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*
Reserved, RES0.

**SS, bit [21]**
Software Step. Copied to PSTATE.SS on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**
Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**
Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**
Endianness. Copied to PSTATE.E on exiting Debug state.
If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**
SError interrupt mask. Copied to PSTATE.A on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**
IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**
FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**
T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4], bit [4]**
Execution state. Copied to PSTATE.nRW on exiting Debug state.
0b1 AArch32 execution state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**
AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.
0b0000 User.
0b0001 FIQ.
0b0010 IRQ.
0b0011 Supervisor.
0b0110 Monitor.
0b0111 Abort.
0b1010 Hyp.
0b1011 Undefined.
0b1111 System.
Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in *Illegal exception returns from AArch64 state* on page D1-4645.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*When AArch64 is supported and entering or exiting Debug state from or to AArch64 state:*

| 31  | N        | Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| 30  | Z        | Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| 29  | C        | Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| 28  | V        | Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| 27-26| Reserved | Reserved, RES0.                                                             |
| 25  | TCO      | Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.  
When FEAT_MTE is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented. |
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:
User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]
Reserved, RES0.
ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on entering Debug state, and copied to PSTATE.ALLINT on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [5]
Reserved, RES0.

M[4], bit [4]
Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.
0b0 AArch64 execution state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]
AArch64 Exception level and selected Stack Pointer.
0b0000 EL0t.
0b0100 EL1t.
0b0101 EL1h.
0b1000 EL2t.
0b1001 EL2h.
0b1100 EL3t.
0b1101 EL3h.
Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in Illegal exception returns from AArch64 state on page D1-4645.
The bits in this field are interpreted as follows:
• M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
• M[1] is unused and is 0 for all non-reserved values.
• M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR_EL0
Accesses to this register use the following encodings in the System register encoding space:

\[
\text{\textbf{MRS} } \langle \text{Xt} \rangle, \text{DSPSR_EL0}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

D17.3.15 MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configurations**

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

**Attributes**

MDCCINT_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
<th>Value</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-31</td>
<td>Reserved, RES0.</td>

### D17.3.17  MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

**Purpose**

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configurations**

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MDCR_EL2 is a 64-bit register.

**Field descriptions**

[Diagram of field descriptions]

**Bits [63:37]**

Reserved, RES0.

**HPMFZS, bit [36]**

*When FEAT_SPEv1p2 is implemented:*

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ, E} == {1, 1} and PMBSR_EL1.S == 1.

0b0 Do not freeze on Statistical Profiling Buffer Management event.

0b1 Event counters do not count following a Statistical Profiling Buffer Management event.

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [35:30]**

Reserved, RES0.
HPMFZO, bit [29]

When FEAT_PMU\textsubscript{v3p7} is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

- 0b0 \hspace{1em} Do not freeze on overflow.
- 0b1 \hspace{1em} Event counters do not count when \texttt{PMOVNSCLR\_EL0\_EL0.N-1\_MDCR\_EL2.HPMN} is nonzero.

If MDCR\_EL2.HPMN is less than PMCR\_EL0.N, this field affects the operation of event counters in the range [MDCR\_EL2.HPMN .. (PMCR\_EL0.N-1)].

This field does not affect the operation of other event counters and PMCCNTR\_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the \texttt{PMEVTYPE}\textsubscript{\textit{n}}\_EL0.MT bits.

- 0b0 \hspace{1em} FEAT_MTPMU is disabled. The Effective value of \texttt{PMEVTYPE}\textsubscript{\textit{n}}\_EL0.MT is zero.
- 0b1 \hspace{1em} \texttt{PMEVTYPE}\textsubscript{\textit{n}}\_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:
- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

- 0b0 \hspace{1em} This control does not cause any register accesses to be trapped.
- 0b1 \hspace{1em} If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX\_EL1, OSDTRTX\_EL1, MDCCSR\_EL0, MDCCINT\_EL1, and, when the PE is in Non-debug state, DBGDTR\_EL0, DBGDTRRX\_EL0, and DBGDTRTX\_EL0.

AArch32: DBGDTRRX\text{\textsubscript{ext}}, DBGDTRTX\text{\textsubscript{ext}}, DBGDSCR\text{\textsubscript{int}}, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTR\text{\textsubscript{RX\text{\textsubscript{int}}} and DBGDTR\text{\textsubscript{TX\text{\textsubscript{int}}}}.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 \texttt{MRC} and \texttt{MCR} accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 \texttt{LDC} to DBGDTR\text{\textsubscript{RX\text{\textsubscript{int}}} and \texttt{STC} from DBGDTR\text{\textsubscript{RX\text{\textsubscript{int}}}.
- 0x18 for trapped AArch64 \texttt{MRS} and \texttt{MSR} accesses.

When the PE is in Debug state, MDCR\_EL2.TDCC does not trap any accesses to:

AArch64: DBGDTR\_EL0, DBGDTRRX\_EL0, and DBGDTRTX\_EL0.
AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HLP, bit [26]**

*When FEAT_PMUv3p5 is implemented:*

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

- \(0b0\) Event counter overflow on increment that causes unsigned overflow of PMEVCNTR\(<n>\)_EL0[31:0].
- \(0b1\) Event counter overflow on increment that causes unsigned overflow of PMEVCNTR\(<n>\)_EL0[63:0].

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit affects the operation of event counters in the range \([MDCR_EL2.HPMN..(PMCR_EL0.N-1)]\).

This field does not affect the operation of other event counters.

The operation of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**E2TB, bits [25:24]**

*When FEAT_TRBE is implemented:*

EL2 Trace Buffer.

If EL2 is implemented and enabled in the Trace Buffer owning Security state, controls the owning translation regime.

If EL2 is implemented and enabled in the current Security state, controls access to Trace Buffer control registers from EL1.

- \(0b00\) If EL2 is implemented and enabled in the Trace Buffer owning Security state, the Trace Buffer owning Exception level is EL2. Otherwise, the Trace Buffer owning Exception level is EL1 and, if TraceBufferEnabled() == TRUE, tracing is prohibited at EL2.
- \(0b10\) Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2.
- \(0b11\) Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2.

All other values are reserved.

The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HCCD, bit [23]

*When FEAT_PMUv3p5 is implemented:*

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

*Otherwise:*

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

*When FEAT_TRF is implemented:*

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].

This field does not affect the operation of other event counters.

If PMCR_EL0.DP is 1, this field affects PMCCNTR_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

*When FEAT_PMUv3p3p1 is implemented:*

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting and PMCCNTR_EL0 are not affected by this mechanism.</td>
</tr>
</tbody>
</table>
If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE, event counting by some event counters is prohibited at EL2, and if `PMCR_EL0.DP` is 1, `PMCCNTR_EL0` is disabled at EL2.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, this field does not affect the event counters and does not affect `PMCCNTR_EL0`.

Otherwise:

- If `MDCR_EL2.HPMN` is not 0, this field affects the operation of event counters in the range `[0 .. (MDCR_EL2.HPMN-1)]`.
- This field does not affect the operation of other event counters.
- If `PMCR_EL0.DP` is 1, this field affects `PMCCNTR_EL0`.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [16:15]**

Reserved, RES0.

**TPMS, bit [14]**

*When FEAT_SPE is implemented:*

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

0b0 Do not trap Statistical Profiling controls to EL2.

0b1 If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.

The Statistical Profiling control registers trapped by this control are:

- `PMSCR_EL1, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1`.
- If `FEAT_SPEv1p2` is implemented, `PMSNEVFR_EL1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**E2PB, bits [13:12]**

*When FEAT_SPE is implemented:*

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

0b00 If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime.

If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.

0b10 Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.

0b11 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.
The Profiling Buffer control registers trapped by this control are: **PMBLIMITR_EL1**, **PMBPTR_EL1**, and **PMBSR_EL1**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to **MDRAR_EL1** are trapped to EL2, reported using EC syndrome value **0x18**.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value **0x05** and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value **0x0C**:
  - **DBGDRAR**, **DBGDSAR**.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by the following:

- **DBGDSCRTD** and **MDCD_MDLR_TDCC**.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- **MDCR_EL2.TDE == 1**.
- **HCR_EL2.TGE == 1**.

---

**Note**

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TDOSA, bit [10]**

*When FEAT_DoubleLock is implemented:*

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value **0x18**:
  - **OSLR_EL1**, **OSLSR_EL1**, **OSDLR_EL1**, and **DBGPRCR_EL1**.
  - Any **IMPLEMENTATION DEFINED** register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value **0x05**:
  - **DBGOSLSR**, **DBGOSLAR**, **DBGOSDLR**, and **DBGPRCR**.
  - Any **IMPLEMENTATION DEFINED** register with similar functionality that the implementation specifies as trapped by this bit.

0b0 This control does not cause any instructions to be trapped.
EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

--- Note ---

These registers are not accessible at EL0.

---

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGOSLSR, DBGOSLR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

This control does not cause any instructions to be trapped.

EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

--- Note ---

These registers are not accessible at EL0.

---

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

--- Note ---

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

---

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
**TDA, bit [9]**

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
  - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, OSDTRTX_EL1, OSECCR_EL1, DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1.
  - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
  - DBGDIDR, DBGDCINT, DBGFWCR, DBGDCRext, DBGDTRTXext, DBGVCR, DBGDSCINT, DBGDTRRXext, DBGWCR<n>, DBGWVR<n>, DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGSECCR.
  - When not in Debug state, DBGDTRRXint and DBGDTRTXint.

- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are trapped to EL2, reported using EC syndrome value 0x06.

- This control does not cause any instructions to be trapped.

- EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

- Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

- Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1
- HCR_EL2.TGE == 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDE, bit [8]**

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL0.

- The debug target Exception level is EL1.

- If EL2 is enabled for the current Effective value of SCR_EL3.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1.

For more information, see *Routing debug exceptions on page D2-4697*.

This field is treated as being 1 for all purposes other than a direct read when HCR_EL2.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HPME, bit [7]**

*When FEAT_PMUv3 is implemented:*

([MDCR_EL2.HPMN..(N-1)]) event counters enable.

- Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.
0b1  Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0.

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

TPM, bit [6]

*When FEAT_PMUv3 is implemented:*

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

• In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value \(0x18\):
  — PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVVSLRR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPE_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSET_EL0, PMOVSCLR_EL0, PMEVCNTR<\text{n}>_EL0, PMEVTYPER<\text{n}>_EL0, PMCCFILTR_EL0.
  — If FEAT_PMUv3p4 is implemented, PMMIR_EL1

• In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value \(0x03\), MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value \(0x04\):
  — PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPE, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSET, PMOVSSET, PMEVCNTR<\text{n}>, PMEVTYPER<\text{n}>, PMCCFILTR.
  — If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
  — If FEAT_PMUv3p4 is implemented, PMMIR.

0b0  This control does not cause any instructions to be trapped.

0b1  EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

---

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

---

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
TPMCR, bit [5]

**When FEAT_PMUv3 is implemented:**

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value 0x03.

0b0  This control does not cause any instructions to be trapped.

0b1  EL0 and EL1 accesses to the specified registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by the following:

- PMUSERENR.EN.
- PMUSERENR_EL0.EN.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

HPMN, bits [4:0]

**When FEAT_PMUv3 is implemented:**

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is not 0 and is less than PMCR_EL0.N, HPMN divides the event counters into a first range [0..(HPMN-1)], and a second range [HPMN..(PMCR_EL0.N-1)].

If FEAT_HPMN0 is implemented and this field is 0, all event counters are in the second range and none are in the first range.

If HPMN is equal to PMCR_EL0.N, all event counters are in the first range and none are in the second range.

For an event counter <n> in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by PMUSERENR_EL0 or PMUSERENR.
- If FEAT_PMUv3p5 is implemented, PMCR_EL0.LP or PMCR_LP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- PMCR_EL0.E and PMCNTENSET_EL0[n] enable the operation of event counter n.

For an event counter <n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, the event counter is also accessible from EL1, and from EL0 if permitted by PMUSERENR_EL0.
- If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- MDCR_EL2.HPME and PMCNTENSET_EL0[n] enable the operation of event counter n.
If HPMN is larger than `PMCR_EL0.N`, or if `FEAT_HPMN0` is not implemented and HPMN is 0, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of `MDCR_EL2.HPMN` is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if `MDCR_EL2.HPMN` is set to an UNKNOWN non-zero value less than or equal to `PMCR_EL0.N`.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in `PMCR_EL0.N`.

**Otherwise:**

Reserved, RES0.

### Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

**D17.3.18 MDCR_EL3, Monitor Debug Configuration Register (EL3)**

The MDCR_EL3 characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configurations**

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

**Attributes**

MDCR_EL3 is a 64-bit register.

**Field descriptions**

**Bits [63:39]**

Reserved, RES0.

**E3BREC, bit [38]**

When FEAT_BRBEv1p1 is implemented:

Branch Record Buffer EL3 Cold Reset Enable. With MDCR_EL3.E3BRE, controls branch recording at EL3.

- **0b0** When MDCR_EL3.E3BRE == 0: Branch recording at EL3 is disabled.
- **0b1** When MDCR_EL3.E3BRE == 1: Branch recording at EL3 is enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.
E3BREW, bit [37]

*When FEAT_BRBEv1p1 is implemented:*

Branch Record Buffer EL3 Warm Reset Enable. With MDCR_EL3.E3BREC, controls branch recording at EL3.

For a description of the values derived by evaluating MDCR_EL3.E3BREC and MDCR_EL3.E3BREW together, see MDCR_EL3.E3BREC.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

*Otherwise:*

Reserved, RES0.

EnPMSN, bit [36]

*When FEAT_SPEv1p2 is implemented:*

Trap accesses to PMSNEVFR_EL1. Controls access to Statistical Profiling PMSNEVFR_EL1 System register from EL2 and EL1.

- 0b0: Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.
- 0b1: Do not trap PMSNEVFR_EL1 to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

MPMX, bit [35]

*When FEAT_PMUv3p7 is implemented:*

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are enabled at EL3 and in other Secure Exception levels.

- 0b0: Event counting and PMCCNTR_EL0 are not affected by this mechanism.
- 0b1: Event counting by some or all event counters is prohibited at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If EL2 is implemented, MDCR_EL3.SPME == 1, and MDCR_EL2.HPMN is less than PMCR_EL0.N then all the following are true:

- If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0..(MDCR_EL2.HPMN-1)] at EL3.
- This field does not affect the operation of other event counters.
- If PMCR_EL0.DP is 1, this field affects the operation of PMCCNTR_EL0 at EL3.

The operation of this field applies even when EL2 is disabled in the current Security state.

If EL2 is not implemented, MDCR_EL3.SPME == 0, or MDCR_EL2.HPMN is equal to PMCR_EL0.N then this field affects the operation of all event counters at EL3, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 at EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

*Otherwise:*

Reserved, RES0.
MCCD, bit [34]

When FEAT_PMUV3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR_EL0, from counting at EL3.

- 0b0 Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
- 0b1 Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]

When FEAT_BRBVE is implemented:

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.

- 0b00 Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 are prohibited regions.
- 0b01 Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 in Secure state are prohibited regions. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region.
- 0b10 Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be prohibited regions.
- 0b11 This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region.

The Branch Record Buffer registers trapped by this control are: BRBCR_EL1, BRBCR_EL2, BRBCR_EL12, BRBCR_EL1, BRBIFDR0_EL1, BRBIFV<np>_EL1, BRBSTC<np>_EL1, BRBSTCINJ_EL1, BRBTGT<np>_EL1, BRBTGTINJ_EL1, and BRBSTS_EL1.

The Branch Record Buffer instructions trapped by this control are:
- BRB IALL.
- BRB INJ.

Note

If FEAT_BRBVE is not implemented, EL3 is a prohibited region.

Otherwise:

If EL3 is not implemented then the Effective value of this field is 0b11.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [31:29]

Reserved, RES0.
MTPME, bit [28]

When FEAT_MTPMU is implemented:
Multi-threaded PMU Enable. Enables use of the PMEVTPYPER<ν>_EL0.MT bits.

0b0  FEAT_MTPMU is disabled. The Effective value of PMEVTPYPER<ν>_EL0.MT is zero.

0b1  PMEVTPYPER<ν>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:
• On a Cold reset, this field resets to 1.

Otherwise:
Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:
Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

0b0  This control does not cause any register accesses to be trapped.

0b1  Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:
AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.
AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:
• 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
• 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
• 0x18 for trapped AArch64 MSR and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:
AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.
AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSTBE, bit [26]

When FEAT_TRBE is implemented and FEAT_RME is implemented:
Non-secure Trace Buffer Extended. Together with MDCR_EL3.NSTB, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

For a description of the values derived by evaluating NSTB and NSTBE together, see MDCR_EL3.NSTB.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
NSTB, bits [25:24]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer. Together with MDCR_EL3.NSTBE, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

0b00  When MDCR_EL3.NSTBE == 0b0:
Trace Buffer owning Security state is Secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
When MDCR_EL3.NSTBE == 0b1: Reserved.

0b01  When MDCR_EL3.NSTBE == 0b0:
Trace Buffer owning Security state is Secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Realm state generate Trap exceptions to EL3.
When MDCR_EL3.NSTBE == 0b1: Reserved.

0b10  When MDCR_EL3.NSTBE == 0b0:
Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
When MDCR_EL3.NSTBE == 0b1:
Trace Buffer owning Security state is Realm state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.

0b11  When MDCR_EL3.NSTBE == 0b0:
Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure and Realm state generate Trap exceptions to EL3.
When MDCR_EL3.NSTBE == 0b1:
Trace Buffer owning Security state is Realm state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Secure state generate Trap exceptions to EL3.

The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TRBE is implemented and FEAT_RME is not implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

0b00  Trace Buffer owning Security state is Secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.

0b01  Trace Buffer owning Security state is Secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.

0b10  Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.

0b11  Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled () == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.
The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

SCCD, bit [23]

When **FEAT_PMUv3p5** is implemented:
Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

- 0b0 Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
- 0b1 Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

ETAD, bit [22]

When **FEAT_RME** is implemented, external debugger access to the trace unit registers is implemented and **FEAT_TRBE** is implemented:
External Trace Access Disable. Together with MDCR_EL3.ETADE, controls access to trace unit registers by an external debugger.

<table>
<thead>
<tr>
<th>ETADE</th>
<th>ETAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Access to trace unit registers by an external debugger is permitted.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Root and Secure access to trace unit registers by an external debugger is permitted. Realm and Non-secure access to trace unit registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root and Realm access to trace unit registers by an external debugger is permitted. Secure and Non-secure access to trace unit registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Root access to trace unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to trace unit registers by an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

When **external debugger access to the trace unit registers is implemented and **FEAT_TRBE** is implemented:**
External Trace Access Disable. Controls Non-secure access to trace unit registers by an external debugger.

- 0b0 Non-secure accesses from an external debugger to trace unit are allowed.
- 0b1 Non-secure accesses from an external debugger to some trace unit registers are prohibited. See individual registers for the effect of this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.
The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EPMAD, bit [21]**

*When FEAT_RME is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:*

External Performance Monitors Access Disable. Together with MDCR_EL3.EPMADE, controls access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Access to Performance Monitor registers by an external debugger is permitted.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

*When FEAT_Debugv8p4 is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:*

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

- 0b0: Non-secure access to Performance Monitor registers from external debugger is permitted.
- 0b1: Non-secure access to Performance Monitor registers from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

*When FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:*

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

- 0b0: Access to Performance Monitor registers from external debugger is permitted.
- 0b1: Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.
Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_RME is implemented:

External Debug Access Disable. Together with MDCR_EL3.EDADE, controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

<table>
<thead>
<tr>
<th>EDADE</th>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Access to Debug registers by an external debugger is permitted.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0 Non-secure access to debug registers from external debugger is permitted.

0b1 Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0 Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.

0b1 Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

0b0 Access to debug registers from external debugger is permitted.

0b1 Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.
If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

TTRF, bit [19]

When FEAT_TRF is implemented:
Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.
The Trace Filter registers trapped by this control are:
• TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value 0x18.
• HTRFCR and TRFCR, reported using EC syndrome value 0x03.
0b0 Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
0b1 Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:
Secure Trace enable. Enables tracing in Secure state.
0b0 Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1 Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See Register controls to enable self-hosted trace on page G3-9104.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the Effective value of this bit is 0b1.

The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:
Secure Performance Monitors Enable. Controls event counting in Secure state and EL3.
0b0 When MDCR_EL3.MPMX == 0: Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1 When MDCR_EL3.MPMX == 0: Event counting and PMCCNTR_EL0 are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, this field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state.

When MDCR_EL3.MPMX is 1, this field affects the operation of event counters at EL3 only, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 at EL3 only. See MDCR_EL3.MPMX for more information.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.
If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:**
Secure Performance Monitors Enable. Controls event counting in Secure state.
0b0 Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1 Event counting and PMCCNTR_EL0 are not affected by this mechanism.
This field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.
If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**When FEAT_PMUv3 is implemented:**
Secure Performance Monitors Enable. Controls event counting in Secure state.
0b0 If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state.
0b1 Event counting and PMCCNTR_EL0 are not affected by this mechanism.
If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and PMCCNTR_EL0 are not affected by this field.
Otherwise, this field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.
If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**SDD, bit [16]**
AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.
0b0 Debug exceptions in Secure state are not affected by this bit.
0b1 Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.
The SDD bit is ignored unless both of the following are true:
- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0b1.
If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:
- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 0b1.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SPD32, bits [15:14]**

*When EL1 is capable of using AArch32:*

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

- **0b00** Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
- **0b10** Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
- **0b11** Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONstrained UNPREDICTABLE behavior that they must have the same behavior as **0b00**. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:
• The PE is in Secure state.
• The Effective value of SCR_EL3.RW is **0b0**.

If Secure EL1 is using AArch32, then:
• If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
• Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is **0b1**.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is **0b0**, then the Effective value of this field is **0b11**.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, **RES0**.

**NSPB, bits [13:12]**

*When FEAT_SPE is implemented and FEAT_RME is implemented:*

Non-secure Profiling Buffer. Together with MDCR_EL3.NSPBE, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

- **0b00** When MDCR_EL3.NSPBE == **0b0**:
  Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3.
  When MDCR_EL3.NSPBE == **0b1**: Reserved.

- **0b01** When MDCR_EL3.NSPBE == **0b0**:
  Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Realm states generate Trap exceptions to EL3.
  When MDCR_EL3.NSPBE == **0b1**: Reserved.

- **0b10** When MDCR_EL3.NSPBE == **0b0**:
Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3.

When MDCR_EL3.NSPBE == 0b1:
Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3.

When MDCR_EL3.NSPBE == 0b0:
Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSCR_EL12, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- If FEAT_SPEv1p2 is implemented, PMSNEVFR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPE is implemented and FEAT_RME is not implemented:
Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

When EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.
If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSPBE, bit [11]

When FEAT_RME is implemented:
Non-secure Profiling Buffer Extended. Together with MDCR_EL3.NSPB, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

For a description of the values derived by evaluating NSPB and NSPBE together, see MDCR_EL3.NSPB.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:
Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:
• Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1, and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
• Accesses using MCR or MRC to DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR, are trapped to EL3 and reported using EC syndrome value 0x05.
• Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

0b0 This control does not cause any instructions to be trapped.
0b1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:
• AArch64: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
• AArch32: DBGOSLAR, DBGOSLSR, and DBGPRCR.
• AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
• It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

0b0  This control does not cause any instructions to be trapped.
0b1  EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

--- Note ---
The powerdown debug registers are not accessible at EL0.

---
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:
• In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  — DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1, DBGVCR32_EL2.
  — AArch64: MDCR_EL2, MDRAR_EL1, MDCCSR_EL0, MDCCINT_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, OSECCR_EL1.
• In AArch32 state, SDER is trapped to EL3 and reported using EC syndrome value 0x03.
• In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
  — HDCR, DBGDRAR, DBGDSAR, DBGIDIR, DBGDCINT, DBGWFAR, DBGVCR, DBGVR<n>, DBGBCR<n>, DBGXVR<n>, DBGWCR<n>, DBGWVR<n>.
  — DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGSECCR.
• In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are reported using EC syndrome value 0x06.
• When not in Debug state, the following registers are also trapped to EL3:
  — AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0, reported using EC syndrome value 0x18.
  — AArch32 accesses using MCR or MRC to DBGDTRRXint and DBGDTRTXint, reported using EC syndrome value 0x05.

0b0  This control does not cause any instructions to be trapped.
0b1  EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from any Security state and both Execution states, unless it is trapped by DBGDSCRx.UDCCdis, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.
TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1, and EL2 to EL3, from any Security state and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCINTENSET_EL0, PMCINTENCLR_EL0, PMOVSCCLR_EL0, PMSWINC_EL0, PMSEL_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCTR_EL0, PMXEVTYPER_EL0, PMXEVCTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMINTENCLR_EL0, PMINTENSET_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1.

- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - PMCR, PMCINTENSET, PMCINTENCLR, PMOVSR, PMSWINC, PMSEL, PMCEID0, PMCEID1, PMCCTR, PMXEVTYPER, PMXEVCTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.
  - If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
  - If FEAT_PMUv3p4 is implemented, PMMIR.

0b0 This control does not cause any instructions to be trapped.
0b1 EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR.TPM or MDCR_EL2.TPM.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EDADE, bit [4]

When FEAT_RME is implemented:

External Debug Access Disable Extended. Together with MDCR_EL3.EDAD, controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

For a description of the values derived by evaluating EDAD and EDADE together, see MDCR_EL3.EDAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETADE, bit [3]

When FEAT_RME is implemented, external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended. Together with MDCR_EL3.ETAD, controls access to trace unit registers by an external debugger.

For a description of the values derived by evaluating ETAD and ETADE together, see MDCR_EL3.ETAD.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**EPMADE, bit [2]**

When FEAT_RME is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:
External Performance Monitors Access Disable Extended. Together with MDCR_EL3.EPMAD, controls access to Performance Monitor registers by an external debugger.
For a description of the values derived by evaluating EPMAD and EPMADE together, see MDCR_EL3.EPMAD.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Bit [1]**
Reserved, RES0.

**RLTE, bit [0]**

When FEAT_RME is implemented and FEAT_TRF is implemented:
Realm Trace enable. Enables tracing in Realm state.

0b0 Trace prohibited in Realm state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

0b1 Trace in Realm state is not affected by this bit.

This bit also controls the level of authentication that is required by an external debugger to enable external tracing.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Accessing MDCR_EL3**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, MDCR_EL3**

<table>

D17.3.19 MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configurations

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:52]

Reserved, RES0.

ROMADDR, bits [51:12]

ROMADDR encoding when FEAT_LPA is implemented and MDRAR_EL1.Valid != 0b00

ROMADDR, bits [39:0]

Bits [39:0] of the ROM table physical address.

Bits [51:12] of the ROM table physical address are zero.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[PAsize-1]:32] are zero in any system where the implementation only supports execution in AArch32 state.
ROMADDR encoding when FEAT_LPA is not implemented and MDRAR_EL1.Valid != 0b00

Bits [39:36]
Reserved, RES0.

ROMADDR, bits [35:0]
Bits [39:12] of the ROM table physical address.
Bits [11:0] of the ROM table physical address are zero.
For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Root or Realm PA spaces.
Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

ROMADDR encoding when MDRAR_EL1.Valid == 0b00

Bits [39:0]
Reserved, UNKNOWN.

Bits [11:2]
Reserved, RES0.

Valid, bits [1:0]
This field indicates whether the ROM Table address is valid.
0b00 ROM Table address is not valid. Software must ignore ROMADDR.
0b11 ROM Table address is valid.
Other values are reserved.
Arm recommends implementations set this field to zero.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:
MRS <x_t>, MDRAR_EL1

<table>

    end if

D17.3.20 MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configurations**

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDSCRExt[31:0].

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register DBGDSCRInt[15].

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register DBGDSCRInt[12].

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRInt[5:2].

**Attributes**

MDSCR_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:32]

Reserved, RES0.

TFO, bit [31]

*When FEAT_TRF is implemented:*

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

* When OSLSR_EL1.OSLK == 1, access to this field is RW.
* When OSLSR_EL1.OSLK == 0, access to this field is RO.

**Otherwise:**

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When OSLR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXfull. Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

The reset behavior of this field is:
- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

TXfull, bit [29]

Used for save/restore of EDSCR.TXfull.

When OSLR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXfull. Reads and writes of this bit are indirect accesses to EDSCR.TXfull.

The reset behavior of this field is:
- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of EDSCR.RXO.

When OSLR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXO. Reads and writes of this bit are indirect accesses to EDSCR.RXO.

When OSLR_EL1.OSLK == 1, if bits [27,6] of the value written to MDSCR_EL1 are \{1,0\}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets EDSCR.{RXO,ERR} to UNKNOWN values.

The reset behavior of this field is:
- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

TXU, bit [26]

Used for save/restore of EDSCR.TXU.

When OSLR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXU. Reads and writes of this bit are indirect accesses to EDSCR.TXU.

When OSLR_EL1.OSLK == 1, if bits [26,6] of the value written to MDSCR_EL1 are \{1,0\}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets EDSCR.{TXU,ERR} to UNKNOWN values.

The reset behavior of this field is:
- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

Bits [25:24]

Reserved, RES0.
INTdis, bits [23:22]
Used for save/restore of EDSCR.INTdis.
When OSLSR_EL1.OSLK == 0, and software must treat this bit as UNK/SBZP.
When OSLSR_EL1.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.
The reset behavior of this field is:
• The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When OSLSR_EL1.OSLK == 1, access to this field is RW.
• When OSLSR_EL1.OSLK == 0, access to this field is RO.

TDA, bit [21]
Used for save/restore of EDSCR.TDA.
When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.
The reset behavior of this field is:
• The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When OSLSR_EL1.OSLK == 1, access to this field is RW.
• When OSLSR_EL1.OSLK == 0, access to this field is RO.

Bit [20]
Reserved, RES0.

SC2, bit [19]
When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:
Used for save/restore of EDSCR.SC2.
When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.
Accessing this field has the following behavior:
• When OSLSR_EL1.OSLK == 1, access to this field is RW.
• When OSLSR_EL1.OSLK == 0, access to this field is RO.
Otherwise:
Reserved, RES0.

Bits [18:16]
Reserved, RAZ/WI.
Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]
Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.
0b0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.
HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The reset behavior of this field is:
- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D.

Permitted values are:
- 0b0: Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.
- 0b1: All debug exceptions enabled within EL_D.
- RES0 if EL_D is using AArch32.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, as follows:
- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x85:
  - DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRXint, and DBGDTRXXint.
- In AArch32 state, LDC access to DBGDTRXXint and STC access to DBGDTRXXint are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value 0x0C.

0b0: This control does not cause any instructions to be trapped.
0b1: EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped.
EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.ERR`. Reads and writes of this bit are indirect accesses to `EDSCR.ERR`.

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is RW.
- When `OSLSR_EL1.OSLK == 0`, access to this field is RO.

**Bits [5:1]**

Reserved, RES0.

**SS, bit [0]**

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

- 0b0 Software step disabled
- 0b1 Software step enabled.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing MDSCR_EL1**

Accesses to this register use the following encodings in the System register encoding space:

D17.3.21 OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

**Purpose**

Used to control the OS Double Lock.

**Configurations**

AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSDLR[31:0].

**Attributes**

OSDLR_EL1 is a 64-bit register.

**Field descriptions**

| Bits [63:1] | Reserved, RES0. |
| DLK, bit [0] | Reserved, RES0. |

**When FEAT_DoubleLock is implemented:**

OS Double Lock control bit.

- 0b0 OS Double Lock unlocked.
- 0b1 OS Double Lock locked, if DBGPRCR_EL1.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RAZ/WI.

**Accessing OSDLR_EL1**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, OSDLR_EL1**

<table>

D17.3.22 OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

**Purpose**

Used for save and restore of DBGDTRRX_EL0. It is a component of the Debug Communications Channel.

**Configurations**

AArch64 System register OSDTRRX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXext[31:0].

**Attributes**

OSDTRRX_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX without side-effect.

Updates to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

**Accessing OSDTRRX_EL1**

Arm deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, OSDTRRX_EL1**

D17.3.24 OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configurations**

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

**Attributes**

OSECCR_EL1 is a 64-bit register.

**Field descriptions**

*When OSLSR_EL1.OSLK == 1:*

![Field Diagram]

- **Bits [63:32]**
  - Reserved, RES0.

- **EDECCR, bits [31:0]**
  - Used for save/restore to EDECCR over powerdown.
  - Reads or writes to this field are indirect accesses to EDECCR.

**Accessing OSECCR_EL1**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, OSECCR_EL1**

D17.3.25 **OSLAR_EL1, OS Lock Access Register**

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS Lock.

**Configurations**

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

The OS Lock can also be locked or unlocked using DBGOSLAR.

**Attributes**

OSLAR_EL1 is a 64-bit register.

**Field descriptions**

**Bits [63:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use OSLSR_EL1.OSLK to check the current status of the lock.

**Accessing OSLAR_EL1**

Accesses to this register use the following encodings in the System register encoding space:

D17.3.26 OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

**Purpose**

Provides the status of the OS Lock.

**Configurations**

AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLR[31:0].

**Attributes**

OSLR_EL1 is a 64-bit register.

**Field descriptions**

![OSLR_EL1 Diagram]

**Bits [63:4]**

Reserved, RES0.

**OSLM, bits [3, 0]**

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

- **0b00** OS Lock not implemented.
- **0b10** OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status.

- **0b0** OS Lock unlocked.
- **0b1** OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

**Accessing OSLSR_EL1**

Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, OSLSR_EL1

**SDER32_EL2, AArch32 Secure Debug Enable Register**

The SDER32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from Secure EL2 and EL3 only.

**Configurations**

AArch64 System register SDER32_EL2 bits [63:0] are architecturally mapped to AArch64 System register SDER32_EL3[63:0] when EL3 is implemented.

AArch64 System register SDER32_EL2 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL2 is implemented, FEAT_SEL2 is implemented and EL1 is capable of using AArch32. Otherwise, direct accesses to SDER32_EL2 are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER32_EL2 is a 64-bit register.

**Field descriptions**

D17.3.29 TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configurations**

AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TRFCR[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

**Attributes**

TRFCR_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

- **0b01** Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2.
- **0b10** *When FEAT_ECV is implemented:* Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:
  - SCR_EL3.ECVEn == 0.
  - CNTHCTL_EL2.ECV == 0.
- **0b11** Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and TRFCR_EL2.TS != 0b00.
- SelfHostedTraceEnabled () == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [4:2]**

Reserved, RES0.
E1TRE, bit [1]

EL1 Trace Enable.

0b0 Trace is prohibited at EL1.

0b1 Trace is allowed at EL1.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

• On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

0b0 Trace is prohibited at EL0.

0b1 Trace is allowed at EL0.

This field is ignored if any of the following are true:

• SelfHostedTraceEnabled() == FALSE.

• EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE == 1.

The reset behavior of this field is:

• On a Warm reset, this field resets to 0.

D17.3.30 TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configurations**

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

TRFCR_EL2 is a 64-bit register.

**Field descriptions**

Bits [63:7]

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

- 0b00 Timestamp controlled by TRFCR_EL1.TS or TRFCR.TS.
- 0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2.
- 0b10 *When FEAT_ECV is implemented:* Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:
  - SCR_EL3.ECVEn == 0.
  - CNTHCTL_EL2.ECV == 0.
- 0b11 Physical timestamp. The traced timestamp is the physical counter value.

This field is ignored by the PE when SelfHostedTraceEnabled () == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**Bit [4]**

Reserved, RES0.

**CX, bit [3]**

CONTEXTIDR_EL2 and VMID trace enable.

- 0b0 CONTEXTIDR_EL2 and VMID trace prohibited.
0b1 CONTEXTIDR_EL2 and VMID trace allowed.
This field is ignored if SelfHostedTraceEnabled() != FALSE.
The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

Bit [2]
Reserved, RES0.

E2TRE, bit [1]
EL2 Trace Enable.
0b0 Trace is prohibited at EL2.
0b1 Trace is allowed at EL2.
This field is ignored if SelfHostedTraceEnabled() != FALSE.
The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

E0HTRE, bit [0]
EL0 Trace Enable.
0b0 Trace is prohibited at EL0 when HCR_EL2.TGE == 1.
0b1 Trace is allowed at EL0 when HCR_EL2.TGE == 1.
This field is ignored if any of the following are true:
• SelfHostedTraceEnabled() != FALSE.
• EL2 is disabled in the current security state.
• HCR_EL2.TGE == 0.
The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

Accessing TRFCR_EL2
Accesses to this register use the following encodings in the System register encoding space:

D17.4 Trace registers

This section lists the Performance Monitoring registers in AArch64.
D17.4.1 TRBBASER_EL1, Trace Buffer Base Address Register

The TRBBASER_EL1 characteristics are:

**Purpose**
Defines the base address for the trace buffer.

**Configurations**
This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBBASER_EL1 are UNDEFINED.

**Attributes**
TRBBASER_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>BASE, bits [63:12]</th>
</tr>
</thead>
</table>
| Trace Buffer Base pointer address. (TRBBASER_EL1.BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log2(smallest implemented translation granule). The reset behavior of this field is:
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:0]**
Reserved, RES0.

**Accessing TRBBASER_EL1**
The PE might ignore a direct write to TRBBASER_EL1 if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings in the System register encoding space:

### MRS <Xt>, TRBBASER_EL1

D17.4.2 TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

**Purpose**

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

**Configurations**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are UNDEFINED.

**Attributes**

TRBIDR_EL1 is a 64-bit register.

**Field descriptions**

| Bits [63:12] | Reserved, RES0. |
| Bits [7:6] | Reserved, RES0. |

**From Armv9.3:**

External Abort handling. Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer.

- **0b0000**: Not described.
- **0b0001**: The PE ignores External aborts on writes made by the Trace Buffer Unit.
- **0b0010**: The External abort generates an SError interrupt at the PE.

All other values are reserved.

From Armv9.3, the value **0b0000** is not permitted.

TRBIDR_EL1.EA describes only External aborts generated by the write to memory. External aborts on a translation table walk made by the Trace Buffer Unit generate trace buffer management events reported as MMU faults using TRBSR_EL1.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Otherwise:**

Reserved, RES0.
Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime.

--- Note ---

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv9.3, the value 0 is not permitted.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the trace buffer is owned by a higher Exception level or another Security state. Defined values are:

- **0b0**  Programming is allowed.
- **0b1**  Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSTB, MDCR_EL3.NSTBE, and MDCR_EL2.E2TB:

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
  - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2TB is 0b00, Secure EL1.
- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2TB is 0b00, Non-secure EL1.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and the owning Security state is Realm state, this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - Secure EL1 and Secure EL2.
  - If MDCR_EL2.E2TB is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2TB is 0b00, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to TRBPTR_EL1 and TRBTRG_EL1.

Defined values are:

- **0b0000**  Byte.
- **0b0001**  Halfword.
- **0b0010**  Word.
- **0b0011**  Doubleword.
Accessing TRBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

$\text{MRS} \langle X_t \rangle, \text{TRBIDR}_\text{EL1}$

<table>
<thead>
<tr>

D17.4.3 TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configurations

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions

LIMIT, bits [63:12]

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:6]

Reserved, RES0.

nVM, bit [5]

Address mode.

0b0 The trace buffer pointers are virtual addresses.

0b1 The trace buffer pointers are:

- Physical address in the owning security state if the owning translation regime has no stage 2 translation.
- Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TM, bits [4:3]

Trigger mode.

0b00 Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.

0b01 IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.

0b11 Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.
All other values are reserved.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**FM, bits [2:1]**
Trace buffer mode.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b01</td>
<td>Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b11</td>
<td>Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.</td>
</tr>
</tbody>
</table>

All other values are reserved.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**
Trace Buffer Unit enable.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Trace Buffer Unit disabled.</td>
</tr>
<tr>
<td>1</td>
<td>Trace Buffer Unit enabled by this control.</td>
</tr>
</tbody>
</table>

Regardless of the value of this field, the Trace Buffer Unit is disabled when `SelfHostedTraceEnabled()` == FALSE. All output is discarded by the Trace Buffer Unit when it is disabled.
The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

**Accessing TRBLIMITR_EL1**
The PE might ignore a direct write to TRBLIMITR_EL1, other than a direct write that modifies TRBLIMITR_EL1.E, if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, TRBLIMITR_EL1**

D17.4.4 TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

**Purpose**

- Controls Trace Buffer Unit accesses to memory.
- If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

**Configurations**

- This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are UNDEFINED.

**Attributes**

- TRBMAR_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:10]

- Reserved, RES0.

SH, bits [9:8]

- Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.
  - 0b00: Non-shareable.
  - 0b10: Outer Shareable.
  - 0b11: Inner Shareable.
- All other values are reserved.
- This field is ignored when TRBMAR_EL1.Attr specifies any of the following memory types:
  - Any Device memory type.
  - Normal memory, Inner Non-cacheable, Outer Non-cacheable.
- All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.
- The reset behavior of this field is:
  - On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr[7:4], bits [7:4]

*When TRBMAR_EL1.Attr[3:0] \(\neq\) 0b0000:*

- Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.
- 0b0000: Device-nGnRnE memory.
- 0b0100: When FEAT_XS is implemented:
  - Normal memory, Inner Non-cacheable, Outer Non-cacheable with the XS attribute set to 0.
When FEAT_XS is implemented:
Normal memory, Inner Write-through Cacheable, Outer Write-through Cacheable,
Non-transient, Read-Allocate with the XS attribute set to 0.

When FEAT_MTE2 is implemented:
Tagged Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocation.

All other values are reserved.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the
Outer cacheability attributes, for memory addressed by the trace buffer.

0b0000 Device memory. The Device memory type is defined by TRBMAR_EL1.Attr[3:0].
0b0001 Normal memory, Outer Write-Through Transient, Write-allocate.
0b0010 Normal memory, Outer Write-Through Transient, Read-allocate.
0b0011 Normal memory, Outer Write-Through Transient, Read-allocate Write-allocate.
0b0100 Normal memory, Outer Non-cacheable.
0b0101 Normal memory, Outer Write-Back Transient, Write-allocate.
0b0110 Normal memory, Outer Write-Back Transient, Read-allocate.
0b0111 Normal memory, Outer Write-Back Transient, Read-allocate Write-allocate.
0b1000 Normal memory, Outer Write-Through Non-transient, No allocate.
0b1001 Normal memory, Outer Write-Through Non-transient, Write-allocate.
0b1010 Normal memory, Outer Write-Through Non-transient, Read-allocate.
0b1011 Normal memory, Outer Write-Through Non-transient, Read-allocate Write-allocate.
0b1100 Normal memory, Outer Write-Back Non-transient, No allocate.
0b1101 Normal memory, Outer Write-Back Non-transient, Write-allocate.
0b1110 Normal memory, Outer Write-Back Non-transient, Read-allocate.
0b1111 Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr[3:0], bits [3:0]
When TRBMAR_EL1.Attr[7:4] == 0b0000:
Trace buffer memory attributes. Defines the Device memory attributes for memory addressed by the
trace buffer.

0b0000 Device-nGnRnE memory.
0b0100 Device-nGnRE memory.
0b1000 Device-nGRE memory.
0b1100 Device-GRE memory.
0b0001 When FEAT_XS is implemented:
Device-nGnRnE memory with the XS attribute set to 0.
0b0101 When FEAT_XS is implemented:
Device-nGnRE memory with the XS attribute set to 0.
0b1001 When FEAT_XS is implemented:
Device-nGRE memory with the XS attribute set to 0.
Device-GRE memory with the XS attribute set to 0.
All other values are reserved.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Trace buffer memory attributes. Defines the Inner cacheability attributes for memory addressed by the trace buffer.

0b0000  *When FEAT_MTE2 is implemented or FEAT_XS is implemented:*
The memory type is defined by TRBMAR_EL1.Attr[7:4].

0b0001  Normal memory, Inner Write-Through Transient, Write-allocate.
0b0010  Normal memory, Inner Write-Through Transient, Read-allocate.
0b0011  Normal memory, Inner Write-Through Transient, Read-allocate Write-allocate.
0b0100  Normal memory, Inner Non-cacheable.
0b0101  Normal memory, Inner Write-Back Transient, Write-allocate.
0b0110  Normal memory, Inner Write-Back Transient, Read-allocate.
0b0111  Normal memory, Inner Write-Back Transient, Read-allocate Write-allocate.
0b1000  Normal memory, Inner Write-Through Non-transient, No allocate.
0b1001  Normal memory, Inner Write-Through Non-transient, Write-allocate.
0b1010  Normal memory, Inner Write-Through Non-transient, Read-allocate.
0b1011  Normal memory, Inner Write-Through Non-transient, Read-allocate Write-allocate.
0b1100  Normal memory, Inner Write-Back Non-transient, No allocate.
0b1101  Normal memory, Inner Write-Back Non-transient, Write-allocate.
0b1110  Normal memory, Inner Write-Back Non-transient, Read-allocate.
0b1111  Normal memory, Inner Write-Back Non-transient, Read-allocate Write-allocate.
All other values are reserved.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRBMAR_EL1**
The PE might ignore a direct write to TRBMAR_EL1 if TRBLIMITR_EL1.E == 1.
Accesses to this register use the following encodings in the System register encoding space:

D17.4.5 TRBPTR_EL1, Trace Buffer Write Pointer Register

The TRBPTR_EL1 characteristics are:

**Purpose**

Defines the current write pointer for the trace buffer.

**Configurations**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBPTR_EL1 are UNDEFINED.

**Attributes**

TRBPTR_EL1 is a 64-bit register.

**Field descriptions**

PTR, bits [63:0]

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

The architecture places restrictions on the values that software can write to the pointer.

Note

As a result of the restrictions an implementation might treat some of PTR[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRBPTR_EL1**

The PE might ignore a direct write to TRBPTR_EL1 if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, TRBPTR_EL1**

**D17.4.6 TRBSR_EL1, Trace Buffer Status/syndrome Register**

The TRBSR_EL1 characteristics are:

**Purpose**

Provides syndrome information to software for a trace buffer management event.

**Configurations**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBSR_EL1 are UNDEFINED.

**Attributes**

TRBSR_EL1 is a 64-bit register.

**Field descriptions**

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

- **0b000000** Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.

- **0b011110** *When FEAT_RME is implemented:* Granule Protection Check fault, other than GPF, on write to trace buffer.

- **0b011111** Buffer management event for IMPLEMENTATION DEFINED reason.

- **0b100100** Stage 1 Data Abort on write to trace buffer.

- **0b100101** Stage 2 Data Abort on write to trace buffer.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance interrupt status.

- **0b0** Maintenance interrupt is not asserted.

- **0b1** Maintenance interrupt is asserted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
TRG, bit [21]

Triggered.
0b0  No Detected Trigger has been observed since this field was last cleared to zero.
0b1  A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:
  •  On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.
0b0  The current write pointer has not wrapped since this field was last cleared to zero.
0b1  The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in
the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the
current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:
  •  On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

External Abort.
0b0  An External Abort has not been asserted.
0b1  An External Abort has been asserted and detected by the Trace Buffer Unit.

The reset behavior of this field is:
  •  On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
  •  When the PE never sets this field as the result of an External Abort, access to this field is
     RES0.
  •  Otherwise, access to this field is RW

S, bit [17]

Stopped.
0b0  Collection has not been stopped.
0b1  Collection is stopped.

The reset behavior of this field is:
  •  On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the management event.
The syndrome contents for each management event are described in the following sections.
The reset behavior of this field is:
  •  On a Cold reset, this field resets to an architecturally UNKNOWN value.

0b10011  Synchronous External abort on translation table walk or hardware update of translation table, level 3.
0b11011  When FEAT_LPA2 is implemented and FEAT_RAS is not implemented:
          Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.
0b10000  Alignment fault.
0b10011  When FEAT_RME is implemented and FEAT_LPA2 is implemented:
          Granule Protection Fault on translation table walk or hardware update of translation table, level -1.
0b10010  When FEAT_RME is implemented:
          Granule Protection Fault on translation table walk or hardware update of translation table, level 0.
0b10011  When FEAT_RME is implemented:
          Granule Protection Fault on translation table walk or hardware update of translation table, level 1.
0b10010  When FEAT_RME is implemented:
          Granule Protection Fault on translation table walk or hardware update of translation table, level 2.
0b10011  When FEAT_RME is implemented:
          Granule Protection Fault on translation table walk or hardware update of translation table, level 3.
0b101000  When FEAT_RME is implemented:
Granule Protection Fault, not on translation table walk or hardware update of translation table.

0b101001  When FEAT_LPA2 is implemented:
Address size fault, level -1.

0b101011  When FEAT_LPA2 is implemented:
Translation fault, level -1.

0b100000  TLB conflict abort.

0b100001  When FEAT_HAFDBS is implemented:
Unsupported atomic hardware update fault.

All other values are reserved.

Accessing TRBSR_EL1

D17.4.7 TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

**Purpose**

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

**Configurations**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED.

**Attributes**

TRBTRG_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
<th>63 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRG</td>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TRG, bits [31:0]**

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

--- **Note** ---

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

---

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRBTRG_EL1**

The PE might ignore a direct write to TRBTRG_EL1 if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings in the System register encoding space:
if PSTATE.EL == EL0 then
  UNDEFINED;

**D17.4.8 TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15**

The TRCACATR<n> characteristics are:

**Purpose**

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

**Configurations**

AArch64 System register TRCACATR<n> bits [63:0] are architecturally mapped to External register TRCACATR<n>[63:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACATR<n> are UNDEFINED.

**Attributes**

TRCACATR<n> is a 64-bit register.

EXLEVEL_RL_EL1, bit [17]

When TRCIDR6.EXLEVEL_RL_EL1 == 1:

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

0b0  When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1.
    When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.

0b1  When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1.
    When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]

When TRCIDR6.EXLEVEL_RL_EL0 == 1:

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

0b0  When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0.
    When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.

0b1  When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0.
    When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]

When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

0b0  The Address Comparator performs comparisons in Non-secure EL2.

0b1  The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EXLEVEL_NS_EL1, bit [13]

When Non-secure EL1 is implemented:
Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.
0b0 The Address Comparator performs comparisons in Non-secure EL1.
0b1 The Address Comparator does not perform comparisons in Non-secure EL1.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]

When Non-secure EL0 is implemented:
Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.
0b0 The Address Comparator performs comparisons in Non-secure EL0.
0b1 The Address Comparator does not perform comparisons in Non-secure EL0.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL3, bit [11]

When EL3 is implemented:
EL3 address comparison control. Controls whether a comparison can occur at EL3.
0b0 The Address Comparator performs comparisons in EL3.
0b1 The Address Comparator does not perform comparisons in EL3.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL2, bit [10]

When EL2 is implemented and FEAT_SEL2 is implemented:
Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.
0b0 The Address Comparator performs comparisons in Secure EL2.
0b1 The Address Comparator does not perform comparisons in Secure EL2.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL1, bit [9]

When Secure EL1 is implemented:
Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.
0b0 The Address Comparator performs comparisons in Secure EL1.
The Address Comparator does not perform comparisons in Secure EL1.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**EXLEVEL__S_EL0, bit [8]**

*When Secure EL0 is implemented:*
Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

0b0  The Address Comparator performs comparisons in Secure EL0.
0b1  The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bit [7]**
Reserved, RES0.

**CONTEXT, bits [6:4]**

*When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:*
Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

0b000  Comparator 0.
0b001  When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1:
        Comparator 1.
0b010  When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2:
        Comparator 2.
0b011  When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3:
        Comparator 3.
0b100  When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4:
        Comparator 4.
0b101  When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5:
        Comparator 5.
0b110  When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6:
        Comparator 6.
0b111  When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7:
        Comparator 7.

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.
CONTEXTTYPE, bits [3:2]

When TRCIDR4.NUMCIDC \neq 0b0000 or TRCIDR4.NUMVMIDC \neq 0b0000:

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

- **0b00** When TRCIDR4.NUMCIDC \neq 0b0000: The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.
- **0b01** When TRCIDR4.NUMVMIDC \neq 0b0000: The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<\text{n}>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.
- **0b10** When TRCIDR4.NUMVMIDC != 0b0000: The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<\text{n}>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.
- **0b11** When TRCIDR4.NUMCIDC \neq 0b0000 and TRCIDR4.NUMVMIDC \neq 0b0000: The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<\text{n}>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.
If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [1:0]
Reserved, RES0.

Accessing TRCACATR<\text{n}>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[\text{n}/2] == 1.
- TRCRSCCTR<\text{n}>.GROUP == 0b0100 and TRCRSCTLTR<\text{n}>.SAC[\text{n}] == 1.
- TRCRSCCTR<\text{n}>.GROUP == 0b0101 and TRCRSCTLTR<\text{n}>.ARC[\text{n}/2] == 1.
- TRCVIIIETCTR.EXCLUDE[\text{n}/2] == 1.
- TRCVIIIECTLTR.INCLUDE[\text{n}/2] == 1.
- TRCVISSCTLR.START[\text{n}] == 1.
- TRCVISSCTLR.STOP[\text{n}] == 1.
- TRCQCTLR.RANGE[\text{n}/2] == 1.
- TRCSSCCR<\text{>}_.ARC[\text{n}/2] == 1.
- TRCSSCCR<\text{>}_.SAC[\text{n}] == 1.
- TRCVIUETCTR.RANGE[\text{n}/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.9 TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

**Purpose**
Contains the address value.

**Configurations**
AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register TRCACVR<n>[63:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACVR<n> are UNDEFINED.

**Attributes**
TRCACVR<n> is a 64-bit register.

**Field descriptions**

ADDRESS, bits [63:0]
Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCACVR<n>**
Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<n>.GROUP == 0b0100 and TRCRSCTLR<n>.SAC[n] == 1.
- TRCRSCTLR<n>.GROUP == 0b0101 and TRCRSCTLR<n>.ARC[n/2] == 1.
- TRCVIIECTL.RANGE[n/2] == 1.
- TRCVIIECTL.RANGE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
• TRCVISSCTRLR.STOP[n] == 1.
• TRCSSCCR<->.ARC[n/2] == 1.
• TRCSSCCR<->.SAC[n] == 1.
• TRCQCTRLR.RANGE[n/2] == 1.

Writers are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRS}< Xt>, \text{TRCACVR}<m> \]

D17.4.10 TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

**Purpose**

 Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

 For additional information, see the CoreSight Architecture Specification.

**Configurations**

AArch64 System register TRCAUTHSTATUS bits [31:0] are architecturally mapped to External register TRCAUTHSTATUS[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are UNDEFINED.

**Attributes**

TRCAUTHSTATUS is a 64-bit register.

**Field descriptions**

```plaintext
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>27-26</td>
<td>RTNID, Root non-invasive debug. This field has the same value as DBGAUTHSTATUS_EL1.RTNID.</td>
</tr>
<tr>
<td>25-24</td>
<td>RTID, Root invasive debug. 0b00 Not implemented.</td>
</tr>
<tr>
<td>15-14</td>
<td>RLNID, Realm non-invasive debug. This field has the same value as DBGAUTHSTATUS_EL1.RLNID.</td>
</tr>
<tr>
<td>13-12</td>
<td>RLID, Realm invasive debug. 0b00 Not implemented.</td>
</tr>
<tr>
<td>11-10</td>
<td>HNID, Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled. 0b00 Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.</td>
</tr>
</tbody>
</table>
```
0b10  Implemented and disabled.
0b11  Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

0b00  Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10  Implemented and disabled.
0b11  Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

0b00  Secure non-invasive debug features not implemented.
0b10  Implemented and disabled.
0b11  Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

0b00  Secure invasive debug features not implemented.
0b10  Implemented and disabled.
0b11  Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

0b00  Non-secure non-invasive debug features not implemented.
0b10  Implemented and disabled.
0b11  Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.
NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

- 0b00: Non-secure invasive debug features not implemented.
- 0b10: Implemented and disabled.
- 0b11: Implemented and enabled.

All other values are reserved.
This field reads as 0b00.

**Accessing TRCAUTHSTATUS**

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, TRCAUTHSTATUS**

<table>

D17.4.12 TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

**Purpose**

Controls the regions in the memory map where branch broadcasting is active.

**Configurations**

AArch64 System register TRCBBCTLR bits [31:0] are architecturally mapped to External register TRCBBCTLR[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR0.TRCBB == 1 and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTLR are UNDEFINED.

**Attributes**

TRCBBCTLR is a 64-bit register.

**Field descriptions**

![Diagram of TRCBBCTLR register]

**Bits [63:9]**

Reserved, RES0.

**MODE, bit [8]**

Mode.

- **0b0** Exclude Mode.
  
  Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE.
  
  If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.

- **0b1** Include Mode.
  
  Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE.
  
  If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE[<m>], bit [m], for m = 7 to 0**

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

- **0b0** The address range that Address Range Comparator <m> defines, is not selected.

- **0b1** The address range that Address Range Comparator <m> defines, is selected.
This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCBBCTRLR**

Must be programmed if TRCCONFIGR.BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, TRCBBCTRLR**

D17.4.13 TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose
Set the threshold value for cycle counting.

Configurations
AArch64 System register TRCCCCTLR bits [31:0] are architecturally mapped to External register TRCCCCTLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are UNDEFINED.

Attributes
TRCCCCTLR is a 64-bit register.

Field descriptions

Bits [63:12]
Reserved, RES0.

THRESHOLD, bits [11:0]
Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if TRCCONFIGR.CCI == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, TRCCCTLR

D17.4.14 TRCCIDCCTLR0, Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose
Contains Context identifier mask values for the TRCCIDCVR<\text{n}> registers, for \text{n} = 0 to 3.

Configurations
AArch64 System register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to External register TRCCIDCCTLR0[31:0].
This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMCIDC) > 0x0 and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR0 are UNDEFINED.

Attributes
TRCCIDCCTLR0 is a 64-bit register.

Field descriptions

Bits [63:32]
Reserved, RES0.

COMP3[\text{<m}>], bit [\text{m}+24], for \text{m} = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 3:
TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.
0b0 The trace unit includes TRCCIDCVR3[(\text{m}×8+7):(\text{m}×8)] when it performs the Context identifier comparison.
0b1 The trace unit ignores TRCCIDCVR3[(\text{m}×8+7):(\text{m}×8)] when it performs the Context identifier comparison.
This bit is RES0 if \text{m} >= TRCIDR2.CIDSIZE.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP2[\text{<m}>], bit [\text{m}+16], for \text{m} = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 2:
TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.
0b0 The trace unit includes TRCCIDCVR2[(\text{m}×8+7):(\text{m}×8)] when it performs the Context identifier comparison.
0b1 The trace unit ignores TRCCIDCVR2[(\text{m}×8+7):(\text{m}×8)] when it performs the Context identifier comparison.
This bit is RES0 if \text{m} >= TRCIDR2.CIDSIZE.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
D17.4 Trace registers

COMP1[m], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

- 0b0 The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
- 0b1 The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP0[m], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

- 0b0 The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
- 0b1 The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCCTL0

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCCTL0

</tbody>
</table>
```

**Bits [63:32]**

Reserved, RES0.

**COMP7[<m>], bit [m+24], for m = 7 to 0**

When UInt(TRCIDR4.NUMCIDC) > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

0b0 The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

0b1 The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COMP6[<m>], bit [m+16], for m = 7 to 0**

When UInt(TRCIDR4.NUMCIDC) > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

0b0 The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

0b1 The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
COMP5[<m>], bit [m+8], for m = 7 to 0

When UInt( TRCIDR4.NUMCIDC ) > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

0b0 The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

0b1 The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is res0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP4[<m>], bit [m], for m = 7 to 0

When UInt( TRCIDR4.NUMCIDC ) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

0b0 The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

0b1 The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is res0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCCTLR1

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.16 TRCCIDCVR<n>, Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

**Purpose**
Contains a Context identifier value.

**Configurations**
AArch64 System register TRCCIDCVR<n> bits [63:0] are architecturally mapped to External register TRCCIDCVR<n>[63:0].
This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMCIDC) > n. Otherwise, direct accesses to TRCCIDCVR<n> are UNDEFINED.

**Attributes**
TRCCIDCVR<n> is a 64-bit register.

**Field descriptions**

![Field Descriptions Diagram]

**VALUE, bits [63:0]**
Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCCIDCVR<n>**
Must be programmed if any of the following are true:
• TRCRSCTLR<n>.GROUP == 0b0110 and TRCRSCTLR<n>.CID[n] == 1.
• TRCACATR<n>.CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<n>.CONTEXT == n.
Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
Accesses to this register use the following encodings in the System register encoding space:

\[\text{MRS <Xt>, TRCCIDCVR<m>}\]

\[
\begin{array}{cccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\text{0b10} & \text{0b001} & \text{0b0011} & \text{m[2:0]:0b0} & \text{0b000} \\
\end{array}
\]

D17.4.17 TRCCLAIMCLR, Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

**Purpose**

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

**Attributes**

TRCCLAIMCLR is a 64-bit register.

**Field descriptions**

Bits [63:32]

Reserved, RES0.

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

0b0 On a read: Claim Tag bit <m> is not set.
On a write: Ignored.

0b1 On a read: Claim Tag bit <m> is set.
On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.
Access to this field is W1C.

D17.4.18 TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configurations

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

0b0 On a read: Claim Tag bit <m> is not implemented.
     On a write: Ignored.

0b1 On a read: Claim Tag bit <m> is implemented.
     On a write: Set Claim Tag bit <m> to 1.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

Access to this field is RAO/W1S.

Reserved, RES0.

CNTCHAIN, bit [17]

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <\text{n-1}>.

\[0b0\] The Counter does not decrement when a reload event for Counter <\text{n-1}> occurs.

\[0b1\] Counter <\text{n}> decrements when a reload event for Counter <\text{n-1}> occurs. This concatenates Counter <\text{n}> and Counter <\text{n-1}>, to provide a larger count value.

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

\[0b0\] Normal mode.

\[0b1\] Self-reload mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.
Selects an event, that when it occurs causes a reload event for Counter \(<n>\).

0b0 A single Resource Selector.

\(\text{TRCCNTCTLR}<n>\).RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

\(\text{TRCCNTCTLR}<n>\).RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. \(\text{TRCCNTCTLR}<n>\).RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

**RLDEVENT_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors.

\(\text{TRCCNTCTLR}<n>\).RLDEVENT.TYPE controls whether \(\text{TRCCNTCTLR}<n>\).RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter \(<n>\).

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**CNTEVENT_TYPE, bit [7]**

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter \(<n>\) to decrement.

0b0 A single Resource Selector.

\(\text{TRCCNTCTLR}<n>\).CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

\(\text{TRCCNTCTLR}<n>\).CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. \(\text{TRCCNTCTLR}<n>\).CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

**CNTEVENT_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors.

\(\text{TRCCNTCTLR}<n>\).CNTEVENT.TYPE controls whether \(\text{TRCCNTCTLR}<n>\).CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter \(<n>\) to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.
Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

## Accessing TRCCNTCTLR\(n\)

Must be programmed if \(TRCRSCTLR\(n\).GROUP == 0b0010\) and \(TRCRSCTLR\(n\).COUNTERS\(n\) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.22 TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

**Purpose**

Controls the tracing options.

**Configurations**

AArch64 System register TRCCONFIGR bits [31:0] are architecturally mapped to External register TRCCONFIGR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCONFIGR are UNDEFINED.

**Attributes**

TRCCONFIGR is a 64-bit register.

**Field descriptions**

Bits [63:16]

Reserved, RES0.

VMIOPT, bit [15]

*When TRCIDR2.VMIDOPT == 0b01:*

Virtual context identifier selection control.
- **0b0** VTTBR_EL2.VMID is used as the Virtual context identifier.
- **0b1** CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

*When TRCIDR2.VMIDOPT == 0b00:*

Reserved, RES0.

Virtual context identifier selection control.

VTTBR_EL2.VMID is used as the Virtual context identifier.

*When TRCIDR2.VMIDOPT == 0b10:*

Reserved, RES1.

Virtual context identifier selection control.

CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

*Otherwise:*

Reserved, RES0.

QE, bits [14:13]

*When TRCIDR0.QSUPP == 0b01:*

Q element generation control.
- **0b00** Q elements are disabled.
- **0b01** Q elements with instruction counts are enabled.
Q elements without instruction counts are disabled.
All other values are reserved.

*When TRCIDR0.QSUPP == 0b10:*

- **0b0**: Q elements are disabled.
- **0b1**: Q elements with instruction counts are enabled.
  Q elements without instruction counts are enabled.

All other values are reserved.

*When TRCIDR0.QSUPP == 0b11:*

- **0b0**: Q elements are disabled.
- **0b1**: Q elements with instruction counts are enabled.
  Q elements without instruction counts are disabled.
- **0b11**: Q elements with instruction counts are enabled.
  Q elements without instruction counts are enabled.

D17.4.23 TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register TRCDEVARCH[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

**Attributes**

TRCDEVARCH is a 64-bit register.

**Field descriptions**

</tbody>
</table>

Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

0b01000111011 JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

0b0  Device Architecture information not present.

0b1  Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

0b00000  ETEv1.0, FEAT_ETE.

0b00010  ETEv1.1, FEAT_ETEv1p1.

0b00100  ETEv1.2, FEAT_ETEv1p2.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

0b01010  ETEv1.
ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

**ARCHPART, bits [11:0]**

Architecture Part. Defines the architecture of the component.

0xA13 Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

D17.4.25 TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configurations

AArch64 System register TRCEVENTCTL0R bits [31:0] are architecturally mapped to External register TRCEVENTCTL0R[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are UNDEFINED.

Attributes

TRCEVENTCTL0R is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

0b0 A single Resource Selector.

TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Defines the selected Resource Selector or pair of Resource Selectors.

TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.
If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Chooses the type of Resource Selector.

0b0 A single Resource Selector.
 TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.
 TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Defines the selected Resource Selector or pair of Resource Selectors.

TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EVENT1_TYPE, bit [15]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

0b0  A single Resource Selector.
    TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1  A Boolean-combined pair of Resource Selectors.
    TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

*  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Defines the selected Resource Selector or pair of Resource Selectors.

TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behavior of this field is:

*  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

0b0  A single Resource Selector.
    TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1  A Boolean-combined pair of Resource Selectors.
    TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

*  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors.

TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRANDED UNPREDICTABLE if the trace unit is not in the Idle state.

D17.4.26 TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

Configurations

AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register TRCEVENTCTL1R[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions

Bits [63:13]

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

0b0 Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.

0b1 Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 1:

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.
If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

<table>

D17.4.27 TRCEXTINSELR<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

Configurations

AArch64 System register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to External register TRCEXTINSELR<n>[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR5.NUMEXTINSEL) > n. Otherwise, direct accesses to TRCEXTINSELR<n> are UNDEFINED.

Attributes

TRCEXTINSELR<n> is a 64-bit register.

Field descriptions

![Field diagram]

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing TRCEXTINSELR<n>**

Must be programmed if any of the following is true: TRCRSCTLR<n>.GROUP == 0b0000 and TRCRSCTLR<n>.EXTIN[n] == 1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, TRCEXTINSELR<m>**

### D17.4.28 TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

The AArch64 System register TRCIDR0 bits [31:0] are architecturally mapped to External register TRCIDR0[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR0 are UNDEFINED.

**Attributes**

TRCIDR0 is a 64-bit register.

**Field descriptions**

**Bits [63:31]**

Reserved, RES0.

**COMMTRANS, bit [30]**

Transaction Start element behavior.

0: Transaction Start elements are P0 elements.

1: Transaction Start elements are not P0 elements.

**COMMOPT, bit [29]**

Indicates the contents and encodings of Cycle count packets.

0: Commit mode 0.

1: Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- RAO/WI if all of the following are true:
  - TRCIDR0.TRCCCI == 1
  - UInt(TRCIDR8.MAXSPEC) == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is RAZ/WI.
- Otherwise, access to this field is RO
TSSIZE, bits [28:24]
Indicates that the trace unit implements Global timestamping and the size of the timestamp value.
0b00000  Global timestamping not implemented.
0b01000  Global timestamping implemented with a 64-bit timestamp value.
All other values are reserved.
This field reads as 0b01000.

TSMARK, bit [23]
*When FEAT_ETEv1p1 is implemented:*
Indicates whether Timestamp Marker elements are generated.
0b0  Timestamp Marker elements are not generated.
0b1  Timestamp Marker elements are generated.
*Otherwise:*
Reserved, RES0.

Bits [22:18]
Reserved, RES0.

TRCEXDATA, bit [17]
*When TRCIDR0.TRCDATA != 0b00:*
Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns.
Data tracing is not implemented in ETE and this field is reserved for other trace architectures.
Allocated in other trace architectures.
0b0  Tracing of data transfers for exceptions and exception returns not implemented.
0b1  Tracing of data transfers for exceptions and exception returns implemented.
*Otherwise:*
Reserved, RES0.

QSUPP, bits [16:15]
Indicates that the trace unit implements Q element support.
0b0  Q element support is not implemented.
0b1  Q element support is implemented, and only supports Q elements with instruction counts.
0b10 Q element support is implemented, and only supports Q elements without instruction counts.
0b11 Q element support is implemented, and supports:
•  Q elements with instruction counts.
•  Q elements without instruction counts.

QFILT, bit [14]
Indicates if the trace unit implements Q element filtering.
0b0  Q element filtering is not implemented.
0b1  Q element filtering is implemented.
If TRCIDR0.QSUPP == 0b0 then this field is 0.
CONDTYPE, bits [13:12]

When TRCIDR0.TRCCOND == 1:
Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

0b00  Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01  Conditional instructions are traced with an indication of the APSR condition flags.
All other values are reserved.

Otherwise:
Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:
Indicates the number of ETEEvents implemented.

0b00  The trace unit supports 0 ETEEvents.
All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:
Indicates the number of ETEEvents implemented.

0b00  The trace unit supports 1 ETEEvent.
0b01  The trace unit supports 2 ETEEvents.
0b10  The trace unit supports 3 ETEEvents.
0b11  The trace unit supports 4 ETEEvents.

Otherwise:
Reserved, RES0.

RETSTACK, bit [9]
Indicates if the trace unit supports the return stack.

0b0  Return stack not implemented.
0b1  Return stack implemented.

Bit [8]
Reserved, RES0.

TRCCCI, bit [7]
Indicates if the trace unit implements cycle counting.

0b0  Cycle counting not implemented.
0b1  Cycle counting implemented.
This field reads as 1.

TRCCOND, bit [6]
Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

0b0  Conditional instruction tracing not implemented.
0b1  Conditional instruction tracing implemented.
This field reads as 0.

TRCBB, bit [5]
Indicates if the trace unit implements branch broadcasting.

0b0  Branch broadcasting not implemented.
Branch broadcasting implemented.
This field reads as 1.

TRCDATA, bits [4:3]
Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

0b00  Data tracing not implemented.
0b11  Data tracing implemented.
All other values are reserved.
This field reads as 0b00.

INSTP0, bits [2:1]
Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

0b00  Load and store instructions are not P0 instructions.
0b11  Load and store instructions are P0 instructions.
All other values are reserved.
This field reads as 0b00.

Bit [0]
Reserved, RES1.

D17.4.29 TRCIDR1, ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configurations

AArch64 System register TRCIDR1 bits [31:0] are architecturally mapped to External register TRCIDR1[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR1 are UNDEFINED.

Attributes

TRCIDR1 is a 64-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>

<td>REVISION, bits [3:0]</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1.Implementer.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

0b1111 If both TRCARCHMAJ and TRCARCHMIN == 0xf then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

TRCARCHMIN, bits [7:4]

Minor architecture version.

0b1111 If both TRCARCHMAJ and TRCARCHMIN == 0xf then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.
Accessing TRCIDR1

Accesses to this register use the following encodings in the System register encoding space:

### D17.4.34 TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

AArch64 System register TRCIDR2 bits [31:0] are architecturally mapped to External register TRCIDR2[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR2 are undefined.

**Attributes**

TRCIDR2 is a 64-bit register.

**Field descriptions**

![Field Diagram]

- **Bits [63:32]**
  - Reserved, RES0.

- **WFXMODE, bit [31]**
  - Indicates whether WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions:
    - 0b0: WFI, WFIT, WFE, and WFET instructions are not classified as P0 instructions.
    - 0b1: WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions.

- **VMIDOPT, bits [30:29]**
  - Indicates the options for Virtual context identifier selection.
    - 0b00: Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.
    - 0b01: Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.
    - 0b10: Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.
    - All other values are reserved.

- **CCSIZE, bits [28:25]**
  - Indicates the size of the cycle counter.
    - 0b0000: The cycle counter is 12 bits in length.
    - 0b0001: The cycle counter is 13 bits in length.
    - 0b0010: The cycle counter is 14 bits in length.
    - 0b0011: The cycle counter is 15 bits in length.
    - 0b0100: The cycle counter is 16 bits in length.
0b0101  The cycle counter is 17 bits in length.
0b0110  The cycle counter is 18 bits in length.
0b0111  The cycle counter is 19 bits in length.
0b1000  The cycle counter is 20 bits in length.
All other values are reserved.

Otherwise:
Reserved, RES0.

DVSIZE, bits [24:20]
When TRCIDR0.TRCDATA != 0b00:
Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.
0b00000  Data value tracing not implemented.
0b00100  Data value tracing has a maximum of 32-bit data values.
0b01000  Data value tracing has a maximum of 64-bit data values.
All other values are reserved.

Otherwise:
Reserved, RES0.

DASIZE, bits [19:15]
When TRCIDR0.TRCDATA != 0b00:
Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.
0b00000  Data address tracing not implemented.
0b00100  Data address tracing has a maximum of 32-bit data addresses.
0b01000  Data address tracing has a maximum of 64-bit data addresses.
All other values are reserved.

Otherwise:
Reserved, RES0.

VMIDSIZE, bits [14:10]
Indicates the trace unit Virtual context identifier size.
0b00000  Virtual context identifier tracing is not supported.
0b00001  8-bit Virtual context identifier size.
0b00010  16-bit Virtual context identifier size.
0b00100  32-bit Virtual context identifier size.
All other values are reserved.
If the PE does not implement EL2 then this field is 0b00000.
If the PE implements EL2 then this field is 0b00100.

CIDSIZE, bits [9:5]
Indicates the Context identifier size.
0b00000  Context identifier tracing is not supported.
0b00100  32-bit Context identifier size.
All other values are reserved.
This field reads as 0b00100.
IASIZE, bits [4:0]

Virtual instruction address size.

0b00100  Maximum of 32-bit instruction address size.
0b01000  Maximum of 64-bit instruction address size.
All other values are reserved.
This field reads as 0b01000.

D17.4.35  TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

**Purpose**

Returns the base architecture of the trace unit.

**Configurations**

AArch64 System register TRCIDR3 bits [31:0] are architecturally mapped to External register TRCIDR3[31:0]. This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR3 are UNDEFINED.

**Attributes**

TRCIDR3 is a 64-bit register.

**Field descriptions**

Bits [63:32]  
Reserved, RES0.

**NOOVERFLOW, bit [31]**

Indicates if overflow prevention is implemented.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow prevention is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow prevention is implemented.</td>
</tr>
</tbody>
</table>

If TRCIDR3.STALLCTL == 0 then this field is 0.

**NUMPROC, bits [13:12, 30:28]**

Indicates the number of PEs available for tracing.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>The trace unit can trace one PE.</td>
</tr>
</tbody>
</table>

This field reads as 0b00000.

The NUMPROC field is split as follows:

* NUMPROC[2:0] is TRCIDR3[30:28].
* NUMPROC[4:3] is TRCIDR3[13:12].

**SYSSTALL, bit [27]**

Indicates if stalling of the PE is permitted.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is permitted.</td>
</tr>
</tbody>
</table>
The value of this field might be dynamic and change based on system conditions.
If TRCIDR3.STALLCTL == 0 then this field is 0.

STALLCTL, bit [26]
Indicates if trace unit implements stalling of the PE.
0b0 Stalling of the PE is not implemented.
0b1 Stalling of the PE is implemented.

SYNCPR, bit [25]
Indicates if an implementation has a fixed synchronization period.
0b0 TRCSYNPR is read/write so software can change the synchronization period.
0b1 TRCSYNPR is read-only so the synchronization period is fixed.
This field reads as 0.

TRCERR, bit [24]
Indicates forced tracing of System Error exceptions is implemented.
0b0 Forced tracing of System Error exceptions is not implemented.
0b1 Forced tracing of System Error exceptions is implemented.
This field reads as 1.

Bit [23]
Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]
Indicates if Non-secure EL2 is implemented.
0b0 Non-secure EL2 is not implemented.
0b1 Non-secure EL2 is implemented.

EXLEVEL_NS_EL1, bit [21]
Indicates if Non-secure EL1 is implemented.
0b0 Non-secure EL1 is not implemented.
0b1 Non-secure EL1 is implemented.

EXLEVEL_NS_EL0, bit [20]
Indicates if Non-secure EL0 is implemented.
0b0 Non-secure EL0 is not implemented.
0b1 Non-secure EL0 is implemented.

EXLEVEL_S_EL3, bit [19]
Indicates if EL3 is implemented.
0b0 EL3 is not implemented.
0b1 EL3 is implemented.

EXLEVEL_S_EL2, bit [18]
Indicates if Secure EL2 is implemented.
0b0 Secure EL2 is not implemented.
0b1 Secure EL2 is implemented.

EXLEVEL_S_EL1, bit [17]
Indicates if Secure EL1 is implemented.
0b0 Secure EL1 is not implemented.
Secure EL1 is implemented.

EXLEVEL_S_EL0, bit [16]
Indicates if Secure EL0 is implemented.
0b0 Secure EL0 is not implemented.
0b1 Secure EL0 is implemented.

Bits [15:14]
Reserved, RES0.

CCITMIN, bits [11:0]
Indicates the minimum value that can be programmed in TRCCCTLR.THRESHOLD.
If TRCIDR0.TRCCCI == 1 then the minimum value of this field is 0x001.
If TRCIDR0.TRCCCI == 0 then this field is zero.

</tbody>
</table>

**Bits [63:32]**
Reserved, RES0.

**NUMVMIDC, bits [31:28]**
Indicates the number of Virtual Context Identifier Comparators that are available for tracing.
- 00000  No Virtual Context Identifier Comparators are available.
- 00001  The implementation has one Virtual Context Identifier Comparator.
- 00010  The implementation has two Virtual Context Identifier Comparators.
- 00011  The implementation has three Virtual Context Identifier Comparators.
- 00100  The implementation has four Virtual Context Identifier Comparators.
- 00101  The implementation has five Virtual Context Identifier Comparators.
- 00110  The implementation has six Virtual Context Identifier Comparators.
- 00111  The implementation has seven Virtual Context Identifier Comparators.
- 01000  The implementation has eight Virtual Context Identifier Comparators.
All other values are reserved.

**NUMCIDC, bits [27:24]**
Indicates the number of Context Identifier Comparators that are available for tracing.
- 00000  No Context Identifier Comparators are available.
- 00001  The implementation has one Context Identifier Comparator.
- 00010  The implementation has two Context Identifier Comparators.
- 00011  The implementation has three Context Identifier Comparators.
- 00100  The implementation has four Context Identifier Comparators.
- 00101  The implementation has five Context Identifier Comparators.
- 00110  The implementation has six Context Identifier Comparators.
0b0111 The implementation has seven Context Identifier Comparators.
0b1000 The implementation has eight Context Identifier Comparators.

All other values are reserved.

NUMSSCC, bits [23:20]
Indicates the number of Single-shot Comparator Controls that are available for tracing.
0b0000 No Single-shot Comparator Controls are available.
0b0001 The implementation has one Single-shot Comparator Control.
0b0010 The implementation has two Single-shot Comparator Controls.
0b0011 The implementation has three Single-shot Comparator Controls.
0b0100 The implementation has four Single-shot Comparator Controls.
0b0101 The implementation has five Single-shot Comparator Controls.
0b0110 The implementation has six Single-shot Comparator Controls.
0b0111 The implementation has seven Single-shot Comparator Controls.
0b1000 The implementation has eight Single-shot Comparator Controls.

All other values are reserved.

NUMRSPAIR, bits [19:16]
Indicates the number of resource selector pairs that are available for tracing.
0b0000 The implementation has zero resource selectors.
0b0001 The implementation has two resource selector pairs.
0b0010 The implementation has three resource selector pairs.
0b0011 The implementation has four resource selector pairs.
0b0100 The implementation has five resource selector pairs.
0b0101 The implementation has six resource selector pairs.
0b0110 The implementation has seven resource selector pairs.
0b0111 The implementation has eight resource selector pairs.
0b1000 The implementation has nine resource selector pairs.
0b1001 The implementation has ten resource selector pairs.
0b1010 The implementation has eleven resource selector pairs.
0b1011 The implementation has twelve resource selector pairs.
0b1100 The implementation has thirteen resource selector pairs.
0b1101 The implementation has fourteen resource selector pairs.
0b1110 The implementation has fifteen resource selector pairs.
0b1111 The implementation has sixteen resource selector pairs.

All other values are reserved.

NUMPC, bits [15:12]
Indicates the number of PE Comparator Inputs that are available for tracing.
0b0000 No PE Comparator Inputs are available.
0b0001 The implementation has one PE Comparator Input.
0b0010 The implementation has two PE Comparator Inputs.
0b0011 The implementation has three PE Comparator Inputs.
0b0100 The implementation has four PE Comparator Inputs.
0b0101 The implementation has five PE Comparator Inputs.
0b0110 The implementation has six PE Comparator Inputs.
0b0111  The implementation has seven PE Comparator Inputs.
0b1000  The implementation has eight PE Comparator Inputs.
All other values are reserved.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:
Indicates whether data address comparisons are implemented. Data address comparisons are not
implemented in ETE and are reserved for other trace architectures. Allocated in other trace
architectures.
0b0  Data address comparisons not implemented.
0b1  Data address comparisons implemented.
This field reads as 0.

Otherwise:
Reserved, RES0.

NUMDVC, bits [7:4]
Indicates the number of data value comparators. Data value comparators are not implemented in
ETE and are reserved for other trace architectures. Allocated in other trace architectures.
0b0000  No data value comparators implemented.
0b0001  One data value comparator implemented.
0b0010  Two data value comparators implemented.
0b0011  Three data value comparators implemented.
0b0100  Four data value comparators implemented.
0b0101  Five data value comparators implemented.
0b0110  Six data value comparators implemented.
0b0111  Seven data value comparators implemented.
0b1000  Eight data value comparators implemented.
All other values are reserved.
This field reads as 0b0000.

NUMACPAIRS, bits [3:0]
Indicates the number of Address Comparator pairs that are available for tracing.
0b0000  No Address Comparator pairs are available.
0b0001  The implementation has one Address Comparator pair.
0b0010  The implementation has two Address Comparator pairs.
0b0011  The implementation has three Address Comparator pairs.
0b0100  The implementation has four Address Comparator pairs.
0b0101  The implementation has five Address Comparator pairs.
0b0110  The implementation has six Address Comparator pairs.
0b0111  The implementation has seven Address Comparator pairs.
0b1000  The implementation has eight Address Comparator pairs.
All other values are reserved.

D17.4.37   TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

AArch64 System register TRCIDR5 bits [31:0] are architecturally mapped to External register TRCIDR5[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR5 are UNDEFINED.

**Attributes**

TRCIDR5 is a 64-bit register.

**Field descriptions**

**Bits [63:31]**

Reserved, RES0.

**NUMCNTR, bits [30:28]**

Indicates the number of Counters that are available for tracing.

- **0b000**  No Counters are available.
- **0b001**  One Counter implemented.
- **0b010**  Two Counters implemented.
- **0b011**  Three Counters implemented.
- **0b100**  Four Counters implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b0000.

**NUMSEQSTATE, bits [27:25]**

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

- **0b000**  The Sequencer is not implemented.
- **0b100**  Four Sequencer states are implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b0000.

**Bit [24]**

Reserved, RES0.
LPOVERRIDE, bit [23]
Indicates support for Low-power Override Mode.
0b0 The trace unit does not support Low-power Override Mode.
0b1 The trace unit supports Low-power Override Mode.

ATBTRIG, bit [22]
Indicates if the implementation can support ATB triggers.
0b0 The implementation does not support ATB triggers.
0b1 The implementation supports ATB triggers.
If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]
Indicates the trace ID width.
0b000000 The external trace interface is not implemented.
0b000111 The implementation supports a 7-bit trace ID.
All other values are reserved.
Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]
Reserved, RES0.

NUMEXTINSEL, bits [11:9]
Indicates how many External Input Selector resources are implemented.
0b000 No External Input Selector resources are available.
0b001 1 External Input Selector resource is available.
0b010 2 External Input Selector resources are available.
0b011 3 External Input Selector resources are available.
0b100 4 External Input Selector resources are available.
All other values are reserved.

NUMEXTIN, bits [8:0]
Indicates how many External Inputs are implemented.
0b1111111111 Unified PMU event selection.
All other values are reserved.

D17.4.46 TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

**Purpose**
Controls when Q elements are enabled.

**Configurations**
AArch64 System register TRCQCTLR bits [31:0] are architecturally mapped to External register TRCQCTLR[31:0].
This register is present only when FEAT_ETE is implemented and TRCIDR0.QFILT == 1.
Otherwise, direct accesses to TRCQCTLR are UNDEFINED.

**Attributes**
TRCQCTLR is a 64-bit register.

**Field descriptions**

![ register diagram ]

**Bits [63:9]**
Reserved, RES0.

**MODE, bit [8]**
Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

0b0 Exclude mode.
The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.

0b1 Include Mode.
The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE[<m>], bit [m], for m = 7 to 0**
Specifies whether Address Range Comparator <m> controls Q elements.

0b0 The address range that Address Range Comparator <m> defines, is not selected.

0b1 The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCQCTLR**

Must be programmed if TRCCONFIGR.QE != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <X>, TRCQCTLR**

D17.4.47  TRCRSCTRL<\textgreater n\textless>, Resource Selection Control Register <\textgreater n\textless>, n = 2 - 31

The TRCRSCTRL<\textgreater n\textless> characteristics are:

**Purpose**

Controls the selection of the resources in the trace unit.

**Configurations**

AArch64 System register TRCRSCTRL<\textgreater n\textless> bits [31:0] are architecturally mapped to External register TRCRSCTRL<\textgreater n\textless>[31:0].

This register is present only when FEAT_ETE is implemented and (UInt(TRCIDR4.NUMRSPAIR) + 1) * 2 > n. Otherwise, direct accesses to TRCRSCTRL<\textgreater n\textless> are UNDEFINED.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

**Attributes**

TRCRSCTRL<\textgreater n\textless> is a 64-bit register.

**Field descriptions**

| Bits [63:22] | Reserved, RES0. |
| PAIRINV, bit [21] |

* **When n MOD 2 == 0:**

  Controls whether the combined result from a resource selector pair is inverted.

  0b0  Do not invert the combined output of the 2 resource selectors.

  0b1  Invert the combined output of the 2 resource selectors.

  If:

  * A is the register TRCRSCTRL<\textgreater n\textless>.
  * B is the register TRCRSCTRL<\textgreater n+1\textless>.

  Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

  * 0b0000 -> A and B.
  * 0b0001 -> Reserved.
  * 0b0010 -> not(A) and B.
  * 0b0011 -> not(A) and not(B).
  * 0b0100 -> not(A) or not(B).
  * 0b0101 -> not(A) or B.
  * 0b0110 -> Reserved.
• 0b111 -> A or B.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

INV, bit [20]
Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

0b0 Do not invert the output of this selector.
0b1 Invert the output of this selector.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]
Selects a group of resources.

0b0000 External Input Selectors.
0b0001 PE Comparator Inputs.
0b0010 Counters and Sequencer.
0b0011 Single-shot Comparator Controls.
0b0100 Single Address Comparators.
0b0101 Address Range Comparators.
0b0110 Context Identifier Comparators.
0b0111 Virtual Context Identifier Comparators.
All other values are reserved.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]
Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

Bits [15:4]
Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0
Selects one or more External Inputs.

0b0 Ignore EXTIN <m>.
0b1 Select EXTIN <m>.
This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for PE Comparator Inputs**

![Diagram](image)

**Bits [15:8]**

Reserved, RES0.

**PECOMP[<m>], bit [m], for m = 7 to 0**

Selects one or more PE Comparator Inputs.

0b0 Ignored PE Comparator Input <m>.
0b1 Select PE Comparator Input <m>.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Counters and Sequencer**

![Diagram](image)

**Bits [15:8]**

Reserved, RES0.

**SEQUENCER[<m>], bit [m+4], for m = 3 to 0**

Sequencer states.

0b0 Ignore Sequencer state <m>.
0b1 Select Sequencer state <m>.

This bit is RES0 if m >= TRCIDR5.NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COUNTERS[<m>], bit [m], for m = 3 to 0**

Counters resources at zero.

0b0 Ignore Counter <m>.
0b1 Select Counter <m> is zero.

This bit is RES0 if m >= TRCIDR5.NUMCNTR.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SAC[<m>], bit [m], for m = 15 to 0**

Selects one or more Single Address Comparators.

- 0b0: Ignore Single Address Comparator <m>.
- 0b1: Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
SELECT encoding for Address Range Comparators

Bits [15:8]
Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0
Selects one or more Address Range Comparators.
0b0 Ignore Address Range Comparator <m>.
0b1 Select Address Range Comparator <m>.
This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

Bits [15:8]
Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0
Selects one or more Context Identifier Comparators.
0b0 Ignore Context Identifier Comparator <m>.
0b1 Select Context Identifier Comparator <m>.
This bit is RES0 if m >= TRCIDR4.NUMCIDC.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators
Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

0b0  Ignore Virtual Context Identifier Comparator <m>.
0b1  Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMVMIDC.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TCRSCTLR<n>

Must be programmed if any of the following are true:

• TRCCNTCTLR<n>.RLDEVENT.TYPE == 0 and TRCCNTCTLR<n>.RLDEEVENT.SEL == n.
• TRCCNTCTLR<n>.RLDEVENT.TYPE == 1 and TRCCNTCTLR<n>.RLDEEVENT.SEL == n/2.
• TRCCNTCTLR<n>.CNTEVENT.TYPE == 0 and TRCCNTCTLR<n>.CNTEVENT.SEL == n.
• TRCCNTCTLR<n>.CNTEVENT.TYPE == 1 and TRCCNTCTLR<n>.CNTEVENT.SEL == n/2.
• TRCEVENTCTLR0.EVENT0.TYPE == 0 and TRCEVENTCTLR0.EVENT0.SEL == n.
• TRCEVENTCTLR0.EVENT0.TYPE == 1 and TRCEVENTCTLR0.EVENT0.SEL == n/2.
• TRCEVENTCTLR0.EVENT1.TYPE == 0 and TRCEVENTCTLR0.EVENT1.SEL == n.
• TRCEVENTCTLR0.EVENT1.TYPE == 1 and TRCEVENTCTLR0.EVENT1.SEL == n/2.
• TRCEVENTCTLR0.EVENT2.TYPE == 0 and TRCEVENTCTLR0.EVENT2.SEL == n.
• TRCEVENTCTLR0.EVENT2.TYPE == 1 and TRCEVENTCTLR0.EVENT2.SEL == n/2.
• TRCEVENTCTLR0.EVENT3.TYPE == 0 and TRCEVENTCTLR0.EVENT3.SEL == n.
• TRCEVENTCTLR0.EVENT3.TYPE == 1 and TRCEVENTCTLR0.EVENT3.SEL == n/2.
• TRCSEQEVR<n>.B.TYPE == 0 and TRCSEQEVR<n>.B.SEL = n.
• TRCSEQEVR<n>.B.TYPE == 1 and TRCSEQEVR<n>.B.SEL = n/2.
• TRCSEQEVR<n>.B.TYPE == 0 and TRCSEQEVR<n>.F.SEL = n.
• TRCSEQEVR<n>.F.TYPE == 1 and TRCSEQEVR<n>.F.SEL = n/2.
• TRCSEQEVR<n>.F.TYPE == 1 and TRCSEQEVR<n>.F.SEL = n/2.
• TRCSEQEVR<n>.RST.TYPE == 0 and TRCSEQEVR<n>.RST.SEL == n.
• TRCSEQEVR<n>.RST.TYPE == 1 and TRCSEQEVR<n>.RST.SEL == n/2.
• TRCTSCTLR.EVENT.TYPE == 0 and TRCTSCTLR.EVENT.SEL == n.
• TRCTSCTLR.EVENT.TYPE == 1 and TRCTSCTLR.EVENT.SEL == n/2.
• TRCVICTLR.EVENT.TYPE == 0 and TRCVICTLR.EVENT.SEL == n.
• TRCVICTLR.EVENT.TYPE == 1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.48 TRCRSR, Resources Status Register

The TRCRSR characteristics are:

**Purpose**

Use this to set, or read, the status of the resources.

**Configurations**

AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register TRCRSR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCRSR are UNDEFINED.

**Attributes**

TRCRSR is a 64-bit register.

**Bits [63:13]**

Reserved, RES0.

**TA, bit [12]**

Tracing active.

0b0 Tracing is not active.

0b1 Tracing is active.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**EVENT[<m>], bit [m+8], for m = 3 to 0**

Untraced status of ETEEvents.

0b0 An ETEEvent <m> has not occurred.

0b1 An ETEEvent <m> has occurred while the resources were in the Paused state.

This bit is res0 if TRCIDR4.NUMRSPAIR == 0 || m > TRCIDR0.NUMEVENT.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:4]**

Reserved, RES0.

**EXTIN[<m>], bit [m], for m = 3 to 0**

The sticky status of the External Input Selectors.

0b0 An event selected by External Input Selector <m> has not occurred.
At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

**Bits [63:16]**

Reserved, RES0.

**B_TYPE, bit [15]**

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state \(n+1\) to state \(n\). For example, if TRCSEQEVR2.B_SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

- \(0b0\) A single Resource Selector.
  - TRCSEQEVR\(<n>\).B_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

- \(0b1\) A Boolean-combined pair of Resource Selectors.
  - TRCSEQEVR\(<n>\).B_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event.
  - TRCSEQEVR\(<n>\).B_SEL[4] is RES0.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [14:13]**

Reserved, RES0.

**B_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR\(<n>\).B_TYPE controls whether TRCSEQEVR\(<n>\).B_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.
Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**F_TYPE, bit [7]**

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

- 0b0 A single Resource Selector.
  TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

- 0b1 A Boolean-combined pair of Resource Selectors.
  TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event.
  TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**F_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCSEQEVR<n>**

Must be programmed if TRCRSCTRL<n>.GROUP == 0b0010 and TRCRSCTRL<n>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.50 TRCSEQRSTEV, Sequencer Reset Control Register

The TRCSEQRSTEV characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configurations

AArch64 System register TRCSEQRSTEV bits [31:0] are architecturally mapped to External register TRCSEQRSTEV[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEV are UNDEFINED.

Attributes

TRCSEQRSTEV is a 64-bit register.

Field descriptions

Bits [63:8]

Reserved, RES0.

RST_TYPE, bit [7]

Chooses the type of Resource Selector.

0b0 A single Resource Selector.

TRCSEQRSTEV.RST_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

TRCSEQRSTEV.RST_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEV.RST_SEL[4] is RES0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors.

TRCSEQRSTEV.RST.TYPE controls whether TRCSEQRSTEV.RST_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.
The reset behavior of this field is:
   • On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCSEQRSTEV**

Must be programmed if TRCRSCTL<\text{n}>.GROUP = 0b0010 and TRCRSCTL<\text{n}>.SEQUENCER != 0b0000.

 Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

D17.4.51 TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

**Purpose**

Use this to set, or read, the Sequencer state.

**Configurations**

AArch64 System register TRCSEQSTR bits [31:0] are architecturally mapped to External register TRCSEQSTR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are UNDEFINED.

**Attributes**

TRCSEQSTR is a 64-bit register.

**Field descriptions**

Bits [63:2]

Reserved, RES0.

**STATE, bits [1:0]**

Set or returns the state of the Sequencer.

0b00 State 0.

0b01 State 1.

0b10 State 2.

0b11 State 3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCSEQSTR**

Must be programmed if TRCRSCTRL<n>.GROUP == 0b0010 and TRCRSCTRL<n>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.52  TRCSSCCR<\text{n}>, Single-shot Comparator Control Register <\text{n}>, \text{n} = 0 - 7

The TRCSSCCR<\text{n}> characteristics are:

**Purpose**

Controls the corresponding Single-shot Comparator Control resource.

**Configurations**

AArch64 System register TRCSSCCR<\text{n}> bits [31:0] are architecturally mapped to External register TRCSSCCR<\text{n}>[31:0].

This register is present only when FEAT ETE is implemented and UInt(TRCIDR4.NUMSSCC) > \text{n}. Otherwise, direct accesses to TRCSSCCR<\text{n}> are UNDEFINED.

**Attributes**

TRCSSCCR<\text{n}> is a 64-bit register.

**Field descriptions**

Bits [63:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

0b0  The Single-shot Comparator Control is in single-shot mode.

0b1  The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC\text{[<m>]}, bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

0b0  The Address Range Comparator <\text{m}>, is not selected for Single-shot control.

0b1  The Address Range Comparator <\text{m}>, is selected for Single-shot control.

This bit is RES0 if \text{m} >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

0b0  The Single Address Comparator <m>, is not selected for Single-shot control.
0b1  The Single Address Comparator <m>, is selected for Single-shot control.

This bit is res0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

•  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSCCR<n>

Must be programmed if any TRCRSCTL<n>.GROUP == 0b0011 and TRCRSCTL<n>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

\[
egin{array}{cccccc}

D17.4.55 TRCSTALLCTRLR, Stall Control Register

The TRCSTALLCTRLR characteristics are:

**Purpose**

Enables trace unit functionality that prevents trace unit buffer overflows.

**Configurations**

AArch64 System register TRCSTALLCTRLR bits [31:0] are architecturally mapped to External register TRCSTALLCTRLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTRLR are UNDEFINED.

**Attributes**

TRCSTALLCTRLR is a 64-bit register.

**Field descriptions**

| Bit [63:14] | Reserved, RES0. |

*When TRCIDR3.NOOVERFLOW == 1:*

- Trace overflow prevention.
  - 0b0: Trace unit buffer overflow prevention is disabled.
  - 0b1: Trace unit buffer overflow prevention is enabled.

Note that enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

| Bit [12:9] | Reserved, RES0. |

| Bit [8] | ISTALL, bit [8] |

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

- 0b0: The trace unit must not stall the PE.
- 0b1: The trace unit can stall the PE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

| Bit [7:4] | Reserved, RES0. |
LEVEL, bits [3:0]
Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.
The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.
The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.
Note that for some implementations, invasion might occur at the minimal invasion level.
One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a non-zero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR
Must be programmed if implemented.
Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSTALLCTLR

D17.4.56 TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configurations

AArch64 System register TRCSTATR bits [31:0] are architecturally mapped to External register TRCSTATR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSTATR are UNDEFINED.

Attributes

TRCSTATR is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

- 0b0 The programmers' model is not stable.
- 0b1 The programmers' model is stable.

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO

IDLE, bit [0]

Idle status.

- 0b0 The trace unit is not idle.
- 0b1 The trace unit is idle.

Accessing TRCSTATR

Accesses to this register use the following encodings in the System register encoding space:
### MRS <Xt>, TRCSTATR

D17.4.57 TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

**Purpose**
Controls how often trace protocol synchronization requests occur.

**Configurations**
AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register TRCSYNCPR[31:0].
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are UNDEFINED.

**Attributes**
TRCSYNCPR is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:5</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31:0</td>
<td>PERIOD, bits [4:0]</td>
</tr>
</tbody>
</table>

**Bits [63:5]**
Reserved, RES0.

**PERIOD, bits [4:0]**
Defines the number of bytes of trace between each periodic trace protocol synchronization request.

- 0b00000: Trace protocol synchronization is disabled.
- 0b01000: Trace protocol synchronization request occurs after 2^8 bytes of trace.
- 0b01001: Trace protocol synchronization request occurs after 2^9 bytes of trace.
- 0b01010: Trace protocol synchronization request occurs after 2^10 bytes of trace.
- 0b01011: Trace protocol synchronization request occurs after 2^11 bytes of trace.
- 0b01100: Trace protocol synchronization request occurs after 2^12 bytes of trace.
- 0b01101: Trace protocol synchronization request occurs after 2^13 bytes of trace.
- 0b01110: Trace protocol synchronization request occurs after 2^14 bytes of trace.
- 0b01111: Trace protocol synchronization request occurs after 2^15 bytes of trace.
- 0b10000: Trace protocol synchronization request occurs after 2^16 bytes of trace.
- 0b10001: Trace protocol synchronization request occurs after 2^17 bytes of trace.
- 0b10010: Trace protocol synchronization request occurs after 2^18 bytes of trace.
- 0b10011: Trace protocol synchronization request occurs after 2^19 bytes of trace.
- 0b10100: Trace protocol synchronization request occurs after 2^20 bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCPR

Must be programmed if TRCIDR3.SYNCPR == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <X>, TRCSYNCPR**

D17.4.58 TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

**Purpose**
Sets the trace ID for instruction trace.

**Configurations**
AArch64 System register TRCTRACEIDR bits [31:0] are architecturally mapped to External register TRCTRACEIDR[31:0].
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCTRACEIDR are UNDEFINED.

**Attributes**
TRCTRACEIDR is a 64-bit register.

**Field descriptions**

![Diagram of field descriptions]

**Bits [63:7]**
Reserved, RES0.

**TRACEID, bits [6:0]**
Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.
If an implementation supports AMBA ATB, then:
- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.
See the AMBA ATB Protocol Specification for information about which ATID values are reserved.
The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCTRACEIDR**
Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.60 TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

**Purpose**
Controls instruction trace filtering.

**Configurations**
AArch64 System register TRCVICTLR bits [31:0] are architecturally mapped to External register TRCVICTLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCVICTLR are UNDEFINED.

**Attributes**
TRCVICTLR is a 64-bit register.

**Field descriptions**

Bits [63:27]
Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

*When TRCIDR6.EXLEVEL_RL_EL2 == 1:*

Filter instruction trace for EL2 in Realm state.

0b0 When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state.

When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.

0b1 When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state.

When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.
EXLEVEL_RL_EL1, bit [25]

When TRCIDR6.EXLEVEL_RL_EL1 == 1:

Filter instruction trace for EL1 in Realm state.

0b0 When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state.

When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.

0b1 When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state.

When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]

When TRCIDR6.EXLEVEL_RL_EL0 == 1:

Filter instruction trace for EL0 in Realm state.

0b0 When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state.

When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.

0b1 When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state.

When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

When Non-secure EL2 is implemented:

Filter instruction trace for EL2 in Non-secure state.

0b0 The trace unit generates instruction trace for EL2 in Non-secure state.

0b1 The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

0b0 The trace unit generates instruction trace for EL1 in Non-secure state.
0b1 The trace unit does not generate instruction trace for EL1 in Non-secure state.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_NS_EL0, bit [20]
When Non-secure EL0 is implemented:
Filter instruction trace for EL0 in Non-secure state.
0b0 The trace unit generates instruction trace for EL0 in Non-secure state.
0b1 The trace unit does not generate instruction trace for EL0 in Non-secure state.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL3, bit [19]
When EL3 is implemented:
Filter instruction trace for EL3.
0b0 The trace unit generates instruction trace for EL3.
0b1 The trace unit does not generate instruction trace for EL3.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL2, bit [18]
When EL2 is implemented and FEAT_SEL2 is implemented:
Filter instruction trace for EL2 in Secure state.
0b0 The trace unit generates instruction trace for EL2 in Secure state.
0b1 The trace unit does not generate instruction trace for EL2 in Secure state.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL1, bit [17]
When Secure EL1 is implemented:
Filter instruction trace for EL1 in Secure state.
0b0 The trace unit generates instruction trace for EL1 in Secure state.
0b1 The trace unit does not generate instruction trace for EL1 in Secure state.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
EXLEVEL_S_EL0, bit [16]

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

0b0 The trace unit generates instruction trace for EL0 in Secure state.
0b1 The trace unit does not generate instruction trace for EL0 in Secure state.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [15:12]
Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCERR == 1:
Controls the forced tracing of System Error exceptions.

0b0 Forced tracing of System Error exceptions is disabled.
0b1 Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TRCRESET, bit [10]
Controls the forced tracing of PE Resets.

0b0 Forced tracing of PE Resets is disabled.
0b1 Forced tracing of PE Resets is enabled.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]
ViewInst start/stop function status.

0b0 Stopped State.
The ViewInst start/stop function is in the stopped state.

0b1 Started State.
The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
• RES1 if all of the following are true:
  — TRCIDR4.NUMACPAIRS == 0b0000
  — TRCIDR4.NUMPC == 0b0000
• Otherwise, access to this field is RW

**Bit [8]**

Reserved, RES0.

**EVENT TYPE, bit [7]**

*When TRCIDR4.NUMRSPAIR != 0b0000:*

Chooses the type of Resource Selector.

0b0  A single Resource Selector.
    TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1  A Boolean-combined pair of Resource Selectors.
    TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**Bits [6:5]**

Reserved, RES0.

**EVENT_SEL, bits [4:0]**

*When TRCIDR4.NUMRSPAIR != 0b0000:*

**EVENT_SEL**

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*When TRCIDR4.NUMRSPAIR == 0b0000:*

**Reserved**

This field is reserved:
• Bits [4:1] are RES0.
• Bit [0] is RES1.

*Otherwise:*

Reserved, RES0.
Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNDEFINED value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.61 TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

**Purpose**

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

**Configurations**

AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register TRCVIIECTLR[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

**Attributes**

TRCVIIECTLR is a 64-bit register.

**Field descriptions**

![Field description diagram]

**Bits [63:24]**

Reserved, RES0.

**EXCLUDE[<m>], bit [m+16], for m = 7 to 0**

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

0b0 The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.

0b1 The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.

**INCLUDE[<m>], bit [m], for m = 7 to 0**

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.
Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

0b0  The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.

0b1  The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

This bit is RES0 if m >= TRCIDR4[NUMACPAIRS].

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing TRCVIIECTLR

Must be programmed if TRCIDR4[NUMACPAIRS] > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.62 TRCVIPCSSCTLR, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

**Purpose**

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

**Configurations**

AArch64 System register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to External register TRCVIPCSSCTLR[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMPC) > 0. Otherwise, direct accesses to TRCVIPCSSCTLR are UNDEFINED.

**Attributes**

TRCVIPCSSCTLR is a 64-bit register.

**Field descriptions**

![Field diagram]

**Bits [63:24]**

Reserved, RES0.

**STOP[<m>], bit [m+16], for m = 7 to 0**

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of stopping trace.

- **0b0** The PE Comparator Input <m>, is not selected as a stop resource.
- **0b1** The PE Comparator Input <m>, is selected as a stop resource.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.

**START[<m>], bit [m], for m = 7 to 0**

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of starting trace.

- **0b0** The PE Comparator Input <m>, is not selected as a start resource.
- **0b1** The PE Comparator Input <m>, is selected as a start resource.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**Accessing TRCVIPCSSCTLR**

Must be programmed if TRCIDR4.NUMPC != 0b0000.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.63  TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

**Purpose**

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

**Configurations**

AArch64 System register TRCVISSCTRL bits [31:0] are architecturally mapped to External register TRCVISSCTRL[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVISSCTRL are UNDEFINED.

**Attributes**

TRCVISSCTRL is a 64-bit register.

**Field descriptions**

| Bits [63:32] | Reserved, RES0. |

**STOP[<m>], bit [m+16], for m = 15 to 0**

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

- 0b0  The Single Address Comparator <m>, is not selected as a stop resource.
- 0b1  The Single Address Comparator <m>, is selected as a stop resource.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
START[<m>], bit [m], for m = 15 to 0
Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for
the purpose of starting trace.
0b0 The Single Address Comparator <m>, is not selected as a start resource.
0b1 The Single Address Comparator <m>, is selected as a start resource.
This bit is res0 if m >= 2 × TRCIDR4.NUMACPAIRS.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVISSCTRL
Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.
For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address
must be a lower numbered comparator.
Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.64 TRCVMIDCCTRLR0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTRLR0 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<\text{n}> registers, where \text{n}=0-3.

**Configurations**

AArch64 System register TRCVMIDCCTRLR0 bits [31:0] are architecturally mapped to External register TRCVMIDCCTRLR0[31:0].

This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x0 and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTRLR0 are UNDEFINED.

**Attributes**

TRCVMIDCCTRLR0 is a 64-bit register.

**Field descriptions**

![Register Diagram]

- **Bits [63:32]**
  - Reserved, RES0.

- **COMP3\[<m>\]**, bit [m+24], for m = 7 to 0
  
  *When UInt(TRCIDR4.NUMVMIDC) > 3:*
  
  TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

  - 0b0: The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
  - 0b1: The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

  This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

  The reset behavior of this field is:
  
  - On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

- **COMP2\[<m>\]**, bit [m+16], for m = 7 to 0
  
  *When UInt(TRCIDR4.NUMVMIDC) > 2:*
  
  TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

  - 0b0: The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
  - 0b1: The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

  This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

  The reset behavior of this field is:
  
  - On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
COMP1[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVmIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVmIDCVR1. Each bit in this field corresponds to a byte in TRCVmIDCVR1.

0b0 The trace unit includes TRCVmIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVmIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP0[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVmIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVmIDCVR0. Each bit in this field corresponds to a byte in TRCVmIDCVR0.

0b0 The trace unit includes TRCVmIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVmIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVmIDCCTLR0

If software uses the TRCVmIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVmIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVmIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, TRCVmIDCCTLR0</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b10</td>

D17.4.65 TRCVMIDCCTLR1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<\textit{n}> registers, where \textit{n}=4-7.

**Configurations**

AArch64 System register TRCVMIDCCTLR1 bits [31:0] are architecturally mapped to External register TRCVMIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x4 and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR1 are UNDEFINED.

**Attributes**

TRCVMIDCCTLR1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:24]</td>
<td>COMP7[&lt;m&gt;]</td>
</tr>
<tr>
<td>Bits [15:8]</td>
<td>COMP6[&lt;m&gt;]</td>
</tr>
<tr>
<td>Bits [7:0]</td>
<td>COMP5[&lt;m&gt;]</td>
</tr>
<tr>
<td>Bits [0]</td>
<td>COMP4[&lt;m&gt;]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**COMP7\[<m>\]**, bit [m+24], for m = 7 to 0

*When UInt(TRCIDR4.NUMVMIDC) > 7:*

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

0b0 The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COMP6\[<m>\]**, bit [m+16], for m = 7 to 0

*When UInt(TRCIDR4.NUMVMIDC) > 6:*

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

0b0 The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
COMP5[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

0b0 The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP4[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

0b0 The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCCTLR1

If software uses the TRCVMIDCVR<n> registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

D17.4.66 TRCVMIDCVR\(<n>\), Virtual Context Identifier Comparator Value Register \(<n>\), \(n = 0 - 7\)

The TRCVMIDCVR\(<n>\) characteristics are:

**Purpose**
Contains the Virtual Context Identifier Comparator value.

**Configurations**
AArch64 System register TRCVMIDCVR\(<n>\) bits [63:0] are architecturally mapped to External register TRCVMIDCVR\(<n>\)[63:0].
This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMVMIDC) > n. Otherwise, direct accesses to TRCVMIDCVR\(<n>\) are UNDEFINED.

**Attributes**
TRCVMIDCVR\(<n>\) is a 64-bit register.

**Field descriptions**

![Field descriptions diagram]

VALUE, bits [63:0]
Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE.
Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing TRCVMIDCVR\(<n>\)**
Must be programmed if any of the following are true:
• TRCRSCTL\(<n>\).GROUP == 0b0111 and TRCRSCTL\(<n>\).VMID[n] == 1.
• TRCACATR\(<n>\).CONTEXTTYPE == 0b10 or 0b11 and TRCACATR\(<n>\).CONTEXT == n.
Accesses to this register use the following encodings in the System register encoding space:

\[ MRS \ <Xt>, \ TRCVMIDCVR<m> \]

D17.5 Performance Monitors registers

This section lists the Performance Monitoring registers in AArch64.
D17.5.1 PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**
Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configurations**
AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].
AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].
This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

**Attributes**
PMCCFILTR_EL0 is a 64-bit register.

**Bits [63:32]**
Reserved, RES0.

**P, bit [31]**
Privileged filtering bit. Controls counting in EL1.
If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.
If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

| 0b0  | Count cycles in EL1. |
| 0b1  | Do not count cycles in EL1. |

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**
User filtering bit. Controls counting in EL0.
If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.
If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

| 0b0  | Count cycles in EL0. |
| 0b1  | Do not count cycles in EL0. |
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:
Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:
Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.
Otherwise, cycles in Non-secure EL0 are not counted.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:
EL2 (Hypervisor) filtering bit. Controls counting in EL2.
If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.
If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.
0b0 Do not count cycles in EL2.
0b1 Count cycles in EL2.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

M, bit [26]

When EL3 is implemented:
Secure EL3 filtering bit.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.
Otherwise, cycles in Secure EL3 are not counted.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bit [25]
Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:
Secure EL2 filtering.
If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure
EL2 are counted.
Otherwise, cycles in Secure EL2 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:
Non-transactional state filtering bit.
0b0 This bit has no effect on filtering of cycles.
0b1 Do not count cycles in Non-transactional state.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:
Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are
counted.
Otherwise, cycles in Realm EL1 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:
Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are
counted.
Otherwise, cycles in Realm EL0 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

\[ MRS <Xt>, \text{PMCCFILTR_EL0} \]

D17.5.2 PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter on page D11-5246* for more information. PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configurations**

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

![Field descriptions diagram]

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.\{LC,D\}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing PMCCNTR_EL0**

Accesses to this register use the following encodings in the System register encoding space:
MRS <Xt>, PMCCNTR_EL0

D17.5.3  PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see *The PMU event number space and common events* on page D11-5275.

**Configurations**

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

**Attributes**

PMCEID0_EL0 is a 64-bit register.

**Field descriptions**

IDhi<n>, bit [n+32], for n = 31 to 0

*When FEAT_PMUv3p1 is implemented:*

IDhi[n] corresponds to Common event (0x4000 + n).

For each bit:

0b0  The Common event is not implemented, or not counted.

0b1  The Common event is implemented.
When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- Note ---
Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

---

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

---

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to Common event n.

For each bit:

- **0b0** The Common event is not implemented, or not counted.
- **0b1** The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- Note ---
Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

---

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

---

D17.5.4  PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see The PMU event number space and common events on page D11-5275.

**Configurations**

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register PMCEID3[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

**Attributes**

PMCEID1_EL0 is a 64-bit register.

**Field descriptions**

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

- 0b0: The Common event is not implemented, or not counted.
- 0b1: The Common event is implemented.
When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- Note ---
Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

- **0b0**: The Common event is not implemented, or not counted.
- **0b1**: The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- Note ---
Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

### D17.5.5 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<\(n\)>_EL0. Reading this register shows which counters are enabled.

**Configurations**

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

**Attributes**

PMCNTENCLR_EL0 is a 64-bit register.

#### Field descriptions

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<\(n\)>, bit [n], for \(n = 30 \text{ to } 0\)**

Event counter disable bit for PMEVCNTR<\(n\)>_EL0.

If \(N\) is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \(N\) is the value in MDCR_EL2.HPMN. Otherwise, \(N\) is the value in PMCR_EL0.N.

- 0b0 When read, means that PMEVCNTR<\(n\)>_EL0 is disabled. When written, has no effect.
0b1 When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing PMCNTENCLR_EL0**

Accesses to this register use the following encodings in the System register encoding space:

**MRS <X>, PMCNTENCLR_EL0**

D17.5.6 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<\(n\)>_EL0. Reading this register shows which counters are enabled.

**Configurations**

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

**Attributes**

PMCNTENSET_EL0 is a 64-bit register.

**Field descriptions**

Bits [63:32]

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

0b0     When read, means the cycle counter is disabled. When written, has no effect.

0b1     When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<\(n\)> , bit [n], for n = 30 to 0

Event counter enable bit for PMEVCNTR<\(n\)> EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

0b0     When read, means that PMEVCNTR<\(n\)> EL0 is disabled. When written, has no effect.
When read, means that PMEVCNTR<\text{n}> EL0 event counter is enabled. When written, enables PMEVCNTR<\text{n}> EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing PMCNTENSET_EL0**

D17.5.7   PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configurations**

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

**Attributes**

PMCR_EL0 is a 64-bit register.

</table>

**Bits [63:33]**

Reserved, RES0.

**FZS, bit [32]**

*When FEAT_SPEv1p2 is implemented:*

Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ,E} == {1,1} and PMBSR_EL1.S == 1.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

0b0: Do not freeze on Statistical Profiling Buffer Management event.

0b1: Event counter PMEVCNTR<n>_EL0 does not count following a Statistical Profiling Buffer Management event if n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
When the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:
Implementer code.
If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use MIDR_EL1 to identify the PE.
Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR_EL1.Implementer.
Use of this field is deprecated.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Otherwise:
Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR_EL0.IMP != 0b0000000000:
Identification code. Use of this field is deprecated.
Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Otherwise:
Reserved, RES0.

N, bits [15:11]
Indicates the number of event counters implemented. This value is in the range of 0b00000 - 0b11111.
If the value is 0b00000, then only PMCCNTR_EL0 is implemented. If the value is 0b11111, then PMCCNTR_EL0 and 31 event counters are implemented.
When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Bit [10]
Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:
Freeze-on-overflow. Stop event counters on overflow.
In the description of this field:
• If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
• If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
• If EL2 is not implemented, PMN is PMCR_EL0.N.
0b0 Do not freeze on overflow.
0b1 Event counter PMEVCNTR<\text{n}>_EL0 does not count when PMOVSSLR_EL0[(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

\textbf{Otherwise:}
Reserved, RES0.

\textbf{Bit [8]}
Reserved, RES0.

\textbf{LP, bit [7]}

\textbf{When FEAT\_PMUv3p5 is implemented:}
Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:
• If EL2 is implemented and is using AArch32, PMN is HDCCR\_HPMN.
• If EL2 is implemented and is using AArch64, PMN is MDCR\_EL2\_HPMN.
• If EL2 is not implemented, PMN is PMCR\_EL0\_N.

0b0 Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<\text{n}>_EL0[31:0].

0b1 Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<\text{n}>_EL0[63:0].

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

\textbf{Otherwise:}
Reserved, RES0.

\textbf{LC, bit [6]}

\textbf{When AArch32 is supported:}
Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0 Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].

0b1 Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

Arm deprecates use of PMCR\_EL0\_LC = 0.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

\textbf{Otherwise:}
Reserved, RES1.
DP, bit [5]

*When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):*

Disable cycle counter when event counting is prohibited.

- **0b0** Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
- **0b1** Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen:
  - If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2.
  - If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3.
  - If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled.
  - If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state.

If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited or frozen.

For more information, see *Prohibiting event and cycle counting on page D11-5256.*

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

X, bit [4]

*When the implementation includes a PMU event export bus:*

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

- **0b0** Do not export events.
- **0b1** Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

D, bit [3]

*When AArch32 is supported:*

Clock divider.

- **0b0** When enabled, PMCCNTR_EL0 counts every clock cycle.
- **0b1** When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**C, bit [2]**

Cycle counter reset. The effects of writing to this bit are:

- 0b0: No action.
- 0b1: Reset PMCCNTR_EL0 to zero.

--- **Note** ---

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

---

Access to this field is WO/RAZ.

**P, bit [1]**

Event counter reset.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

- 0b0: No action.
- 0b1: If n is in the range of affected event counters, resets each event counter PMEVCNTR<\n>_EL0 to zero.

The effects of writing to this bit are:

- If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
- If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
- In EL2 and EL3, a write of 1 to this bit resets all the event counters.
- This field does not affect the operation of other event counters and PMCCNTR_EL0.

--- **Note** ---

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

---

Access to this field is WO/RAZ.

**E, bit [0]**

Enable.

If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.

If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.

If EL2 is not implemented, PMN is PMCR_EL0.N.

- 0b0: PMCCNTR_EL0 is disabled and event counters PMEVCNTR<\n>_EL0, where n is in the range of affected event counters, are disabled.
- 0b1: PMCCNTR_EL0 and event counters PMEVCNTR<\n>_EL0, where n is in the range of affected event counters, are enabled by PMCNTENSET_EL0.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].
This field does not affect the operation of other event counters.
The operation of this field applies even when EL2 is disabled in the current Security state.
The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

\[
\begin{array}{cccc}
op0 & op1 & CRn & CRm & op2 \\
0b11 & 0b011 & 0b1001 & 0b1100 & 0b000
\end{array}
\]

D17.5.8 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**
Holds event counter n, which counts events, where n is 0 to 30.

**Configurations**
AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].
AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].
This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

**Attributes**
PMEVCNTR<n>_EL0 is a 64-bit register.

**Field descriptions**

*When FEAT_PMUv3p5 is implemented:*

![Event counter n diagram](image)

**Bits [63:0]**
Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

![Event counter n diagram](image)

**Bits [63:32]**
Reserved, RES0.

**Bits [31:0]**
Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVCNTR<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

**MRS <Xt>, PMEVCNTR<m>_EL0**

D17.5.9 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configurations**

 AA hire System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AA hire System register PMEVTYPER<n>[31:0].

 AA hire System register PMEVTYPER<n>_EL0 bits [63:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[63:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

**Attributes**

PMEVTYPER<n>_EL0 is a 64-bit register.

**Field descriptions**

TC, bits [63:61]

When FEAT_PMUv3_TH is implemented:

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and PMEVTYPER<n>_EL0.TH as unsigned integer values.

- **0b000**: Not-equal. The counter increments by V on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH. If PMEVTYPER<n>_EL0.TH is zero, the threshold function is disabled.
- **0b001**: Not-equal, count. The counter increments by 1 on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH.
- **0b010**: Equals. The counter increments by V on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH.
- **0b011**: Equals, count. The counter increments by 1 on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH.
- **0b100**: Greater-than-or-equal. The counter increments by V on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more.
- **0b101**: Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more.
- **0b110**: Less-than. The counter increments by V on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH.
- **0b111**: Less-than, count. The counter increments by 1 on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH.
The reset behavior of this field is:

- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**Bits [60:44]**
Reserved, RES0.

**TH, bits [43:32]**

*When FEAT_PMUv3_TH is implemented:*
Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<\texttt{n}>_EL0.TC.

If PMEVTYPER<\texttt{n}>_EL0.TC is \texttt{0b000} and PMEVTYPER<\texttt{n}>_EL0.TH is zero, then the threshold function is disabled.

If PMMIR_EL1.THWIDTH is less than 12, then bits PMEVTYPER<\texttt{n}>_EL0.TH[11:PMMIR_EL1.THWIDTH] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to 2^{PMMIR_EL1.THWIDTH}.

The reset behavior of this field is:

- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**P, bit [31]**
Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<\texttt{n}>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<\texttt{n}>_EL0.RLK bit.

\texttt{0b0} Count events in EL1.
\texttt{0b1} Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**
User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<\texttt{n}>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<\texttt{n}>_EL0.RLU bit.

\texttt{0b0} Count events in EL0.
\texttt{0b1} Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
NSK, bit [29]

When EL3 is implemented:
Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.
If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.
Otherwise, events in Non-secure EL1 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:
Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.
If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.
Otherwise, events in Non-secure EL0 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:
EL2 (Hypervisor) filtering bit. Controls counting in EL2.
If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.
If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.
0b0 Do not count events in EL2.
0b1 Count events in EL2.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

M, bit [26]

When EL3 is implemented:
EL3 filtering bit.
If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.
Otherwise, events in EL3 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

- 0b0: Count events only on controlling PE.
- 0b1: Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See ID_AA64DFR0_EL1.MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Transactional state filtering bit. Controls counting in Transactional state.

- 0b0: This bit has no effect on the filtering of events.
- 0b1: Do not count events in Transactional state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
RLU, bit [21]

*When FEAT_RME is implemented:*

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

- If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.U bit, events in Realm EL0 are counted.
- Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

RLH, bit [20]

*When FEAT_RME is implemented:*

Realm EL2 filtering bit. Controls counting in Realm EL2.

- If the value of this bit is not equal to the value of the PMEVTYPER<\(n\)>_EL0.NSH bit, events in Realm EL2 are counted.
- Otherwise, events in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

*When FEAT_PMUv3p1 is implemented:*

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<\(n\)>_EL0.

The ranges of event numbers allocated to each type of event are shown in Table D11-7 on page D11-5275.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<\(n\)>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<\(n\)>_EL0.evtCount field is the value written to the field.

--- Note ---

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<\(n\)>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<\(n\)>_EL0.evtCount field is the value written to the field.
• If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<\text{n}>_EL0.evtCount field is the value written to the field.

• For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<\text{n}>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<\text{n}>_EL0

PMEVTYPER<\text{n}>_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to n.

If FEAT_FGT is implemented and <\text{n}> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<\text{n}>_EL0 is as follows:

• If <\text{n}> is an unimplemented event counter, the access is UNDEFINED.

• Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <\text{n}> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<\text{n}>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

• Accesses to the register are UNDEFINED.

• Accesses to the register behave as RAZ/WI.

• Accesses to the register execute as a NOP.

• Accesses to the register behave as if <\text{n}> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.

• If EL2 is implemented and enabled in the current Security state, and <\text{n}> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

\textit{MRS <Xt>, PMEVTYPER<m>_EL0}

\begin{tabular}{|c|c|c|c|c|}

D17.5.10 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<\text{\textless}n\text{\textgreater}>_EL0. Reading the register shows which overflow interrupt requests are enabled.

Configurations

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

Attributes

PMINTENCLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32] Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<\text{\textless}n\text{\textgreater}>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for PMEVCNTR<\text{\textless}n\text{\textgreater}>_EL0.
If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

0b0 When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.

0b1 When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D17.5.11 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<\text{n}>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are UNDEFINED.

**Attributes**

PMINTENSET_EL1 is a 64-bit register.

**Field descriptions**

PMINTENSET_EL1 is a 64-bit register.

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<\text{n}>, bit [n], for \text{n} = 30 to 0**

Event counter overflow interrupt request enable bit for PMEVCNTR<\text{n}>_EL0.
If \( N \) is less than 31, then bits \([30:N]\) are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, \( N \) is the value in MDCR_EL2.HPMN. Otherwise, \( N \) is the value in PMCR_EL0.N.

\[ \text{0b0} \]

When read, means that the PMEVCNTR<\(n\)_EL0 event counter interrupt request is disabled. When written, has no effect.

\[ \text{0b1} \]

When read, means that the PMEVCNTR<\(n\)_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<\(n\>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing PMINTENSET_EL1**

Accesses to this register use the following encodings in the System register encoding space:

D17.5.12 PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configurations**

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

**Attributes**

PMMIR_EL1 is a 64-bit register.

**Field descriptions**

**Bits [63:24]**

Reserved, RES0.

**THWIDTH, bits [23:20]**

PMEVTYPER<\(n\)>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<\(n\)>_EL0.TH field.

- 0b0000 FEAT_PMUv3_TH is not implemented.
- 0b0001 1 bit. PMEVTYPER<\(n\)>_EL0.TH[11:1] are RES0.
- 0b0010 2 bits. PMEVTYPER<\(n\)>_EL0.TH[11:2] are RES0.
- 0b0011 3 bits. PMEVTYPER<\(n\)>_EL0.TH[11:3] are RES0.
- 0b0100 4 bits. PMEVTYPER<\(n\)>_EL0.TH[11:4] are RES0.
- 0b0101 5 bits. PMEVTYPER<\(n\)>_EL0.TH[11:5] are RES0.
- 0b0110 6 bits. PMEVTYPER<\(n\)>_EL0.TH[11:6] are RES0.
- 0b0111 7 bits. PMEVTYPER<\(n\)>_EL0.TH[11:7] are RES0.
- 0b1000 8 bits. PMEVTYPER<\(n\)>_EL0.TH[11:8] are RES0.
- 0b1001 9 bits. PMEVTYPER<\(n\)>_EL0.TH[11:9] are RES0.
- 0b1010 10 bits. PMEVTYPER<\(n\)>_EL0.TH[11:10] are RES0.
- 0b1011 11 bits. PMEVTYPER<\(n\)>_EL0.TH[11] is RES0.
- 0b1100 12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero. Otherwise, the largest value that can be written to PMEVTYPER<\(n\)>_EL0.TH is 2^(PMMIR_EL1.THWIDTH) minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log2(number of bytes), plus one.

- 0b0000: The information is not available.
- 0b0011: Four bytes.
- 0b0100: 8 bytes.
- 0b0101: 16 bytes.
- 0b0110: 32 bytes.
- 0b0111: 64 bytes.
- 0b1000: 128 bytes.
- 0b1001: 256 bytes.
- 0b1010: 512 bytes.
- 0b1011: 1024 bytes.
- 0b1100: 2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMMIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMMIR_EL1

<table>

elsif PSTATE.EL == EL3 then
  X[t, 64] = PMMIR_EL1;
D17.5.13 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR-<n>_EL0. Writing to this register clears these bits.

**Configurations**

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are UNDEFINED.

**Attributes**

PMOVSCLR_EL0 is a 64-bit register.

**Field descriptions**

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

Cycle counter overflow clear bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

**PMCR_EL0.LC** controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow clear bit for PMEVCNTR-<n>_EL0.
If \( N \) is less than 31, then bits [30:0] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \( N \) is the value in MDCR_EL2.HPMN. Otherwise, \( N \) is the value in PMCR_EL0.N.

- 0b0  When read, means that PMEVCNTR\( \langle n \rangle \_EL0 \) has not overflowed since this bit was last cleared. When written, has no effect.
- 0b1  When read, means that PMEVCNTR\( \langle n \rangle \_EL0 \) has overflowed since this bit was last cleared. When written, clears the PMEVCNTR\( \langle n \rangle \_EL0 \) overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR\( \langle n \rangle \_EL0[31:0] \) or unsigned overflow of PMEVCNTR\( \langle n \rangle \_EL0[63:0] \).

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
