G8.3.34   SDCR, Secure Debug Control Register

The SDCR characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

**Configurations**

This register is present only when EL3 is capable of using AArch32. Otherwise, direct accesses to SDCR are UNDEFINED.

**Attributes**

SDCR is a 32-bit register.

**Field descriptions**

**MTPME, bit [28]**

*When FEAT_MTPMU is implemented:*

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<\(n\)>.MT bits.

- 0b0  FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<\(n\)>.MT is 0.
- 0b1  PMEVTYPER<\(n\)>.MT bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

**Otherwise:**

Reserved, RES0.

**TDCC, bit [27]**

*When FEAT_FGT is implemented:*

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

- 0b0  This control does not cause any register accesses to be trapped.
- 0b1  Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception.

The DCC registers trapped by this control are:

- **DBGDTRRX**ext, **DBGDTRTX**ext, **DBGDSCR**int, **DBGDCCINT**, and, when the PE is in Non-debug state, **DBGDTRRX**int and **DBGDTRTX**int.
When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- **DBGDTRRXInt and DBGDTRTXInt.**

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**
Reserved, RES0.

**Bits [26:24]**
Reserved, RES0.

**SCCD, bit [23]**

*When FEAT_PMUv3p5 is implemented:*
Secure Cycle Counter Disable. Prohibits PMCCNTR from counting in Secure state.

- **0b0** Cycle counting by PMCCNTR is not affected by this mechanism.
- **0b1** Cycle counting by PMCCNTR is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Bit [22]**
Reserved, RES0.

**EPMAD, bit [21]**

*When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:*
External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

- **0b0** Non-secure access to the Performance Monitors registers from an external debugger is permitted.
- **0b1** Non-secure access to the Performance Monitors registers from an external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

*When FEAT_PMUv3 is implemented:*
External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

- **0b0** Access to Performance Monitors registers from an external debugger is permitted.
- **0b1** Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.
The reset behavior of this field is:
- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**EDAD, bit [20]**

- **When FEAT_Debugv8p4 is implemented:**
  External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.
  - 0b0 Non-secure access to debug registers from an external debugger is permitted.
  - 0b1 Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted.

  If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

  The reset behavior of this field is:
  - On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

- **When FEAT_Debugv8p2 is implemented:**
  External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.
  - 0b0 Access to debug registers from an external debugger is permitted.
  - 0b1 Access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

  If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

  The reset behavior of this field is:
  - On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

  **Otherwise:**
  External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.
  - 0b0 Access to debug registers from an external debugger is permitted.
  - 0b1 Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

  If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

  The reset behavior of this field is:
  - On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**TTRF, bit [19]**

- **When FEAT_TRF is implemented:**
  Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.
  - 0b0 Accesses to HTRFCR and TRFCR are not affected by this control bit.
  - 0b1 When not in Monitor mode, accesses to HTRFCR and TRFCR generate a Monitor Trap exception, unless the access generates a higher priority exception.

  The reset behavior of this field is:
  - On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.
**Otherwise:**

Reserved, RES0.

**STE, bit [18]**

*When FEAT_TRF is implemented:*

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

- **0b0**: Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
- **0b1**: Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See *Register controls to enable self-hosted trace on page G3-9104*.

If EL3 is not implemented and the Effective value of SCR.NS is 0, the PE behaves as if this bit is set to 1.

The reset behavior of this field is:

- **On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.**

**Otherwise:**

Reserved, RES0.

**SPME, bit [17]**

*When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:*

Secure Performance Monitors Enable. Controls event counting in Secure state.

- **0b0**: Event counting is prohibited in Secure state. If PMCR.DP is 1, PMCCNTR is disabled in Secure state. Otherwise, PMCCNTR is not affected by this mechanism.
- **0b1**: Event counting and PMCCNTR are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- **On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.**

*When FEAT_PMUv3 is implemented:*

Secure Performance Monitors Enable. Controls event counting in Secure state.

- **0b0**: If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR.DP is 1, PMCCNTR is disabled in Secure state.
- **0b1**: Event counting and PMCCNTR are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and PMCCNTR are not affected by this field. Otherwise, this field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- **On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.**

**Otherwise:**

Reserved, RES0.
Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

0b00 Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
0b10 Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
0b11 Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER.SUIDEN is 1.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bits [13:0]

Reserved, RES0.

G8.3.35  **SDER, Secure Debug Enable Register**

The SDER characteristics are:

**Purpose**

Controls invasive and non-invasive debug in the Secure EL0 mode.

**Configurations**

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL2[31:0] when EL2 is implemented and FEAT_SEL2 is implemented.

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL3[31:0] when EL3 is implemented.

This register is present only when (EL3 is implemented and EL3 is capable of using AArch32) or (EL1 is capable of using AArch32 and Secure EL1 is implemented). Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**SUNIDEN, bit [1]**

Secure User Non-Invasive Debug Enable.

- **0b0** This bit has no effect on non-invasive debug.
- **0b1** Non-invasive debug is allowed in Secure EL0 using AArch32.

When EL3 or Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- When EL3 is implemented, Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**SUIDEN, bit [0]**

When EL3 is implemented:

Secure User Invasive Debug Enable.

- **0b0** This bit does not affect the generation of debug exceptions at Secure EL0.
- **0b1** If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Accessing SDER**

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, \{<opc1>, <Rt>, <CRn>, <CRm>, \{<opc2>\}}} \\
\text{coproc opc1 CRn CRm opc2} \\
\begin{array}{ccccc}
0b111 & 0b000 & 0b0001 & 0b0001 & 0b001 \\
\end{array}
\]

\[
\text{MCR}\{<c>\}{<q>} \text{ <coproc>, \{<opc1>, <Rt>, <CRn>, <CRm>, \{<opc2>\}}} \\
\text{coproc opc1 CRn CRm opc2} \\
\begin{array}{ccccc}
0b111 & 0b000 & 0b0001 & 0b0001 & 0b001 \\
\end{array}
\]
elsif PSTATE.EL == EL3 then
    if CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        SDER = R[t];

G8.3.36 TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configurations**

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL1[31:0]. This register is present only when EL1 is capable of using AArch32 and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

**Attributes**

TRFCR is a 32-bit register.

**Field descriptions**

![Registers Diagram]

**Bits [31:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

- **0b01** Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.
- **0b10** *When FEAT_ECV is implemented:*
  
  Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:
  
  - EL3 is implemented and is using AArch32.
  - EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0.
  - EL2 is using AArch32.
  - EL2 is using AArch64 and CNTHCTL_EL2.ECV == 0b0.

- **0b11** Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and HTRFCR.TS != 0b0.
- SelfHostedTraceEnabled () == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [4:2]**

Reserved, RES0.

**E1TRE, bit [1]**

EL1 Trace Enable.

- **0b0** Tracing is prohibited in PL1 modes.
0b1  Tracing is allowed in PL1 modes.
This field is ignored if SelfHostedTraceEnabled() == FALSE.
The reset behavior of this field is:
  • On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**
EL0 Trace Enable.
0b0  Tracing is prohibited at EL0.
0b1  Tracing is allowed at EL0.
This field is ignored if any of the following are true:
  • SelfHostedTraceEnabled() == FALSE.
  • EL2 is implemented and enabled in the current security state and HCR.TGE == 1.
The reset behavior of this field is:
  • On a Warm reset, this field resets to 0.

### Accessing TRFCR

Accesses to this register use the following encodings in the System register encoding space:

<table>
<thead>

G8.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.
## G8.4.1  PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

### Purpose

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

### Configurations

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are undefined.

### Attributes

PMCCFILTR is a 32-bit register.

### Field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U</td>
<td>User filtering bit. Controls counting in EL0.</td>
</tr>
<tr>
<td>NSK</td>
<td>When EL3 is implemented: Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.</td>
</tr>
</tbody>
</table>

#### P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

0b0  Count cycles in EL1.
0b1  Do not count cycles in EL1.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

#### U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR.RLU bit.

0b0  Count cycles in EL0.
0b1  Do not count cycles in EL0.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

#### NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.
The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*
Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.
- If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.
- Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*
EL2 (Hyp mode) filtering bit. Controls counting in EL2.
- 0b0: Do not count cycles in EL2.
- 0b1: Count cycles in EL2.

The reset behavior of this field is:
- On a Warm reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**Bits [26:22]**
Reserved, RES0.

**RLU, bit [21]**

*When FEAT_RME is implemented:*
Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.
- If the value of this bit is equal to the value of the PMCCFILTR.U bit, cycles in Realm EL0 are counted.
- Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bits [20:0]**
Reserved, RES0.

**Accessing PMCCFILTR**

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR.SEL set to 0b111111.

Accesses to this register use the following encodings in the System register encoding space:
MRC{<c>}{<q>} <coproc>, (#)opc1, <Rt>, <CRn>, <CRm>{, (#)opc2}
```c
MCR<coproc>,<CRn>,<CRm>{,#<opc1>,,#<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>

```

G8.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D11-5246 for more information. PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

**Configurations**

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is **CONSTRAINED UNPREDICTABLE** whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

**Attributes**

PMCCNTR is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CCNT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing PMCCNTR**

Accesses to this register use the following encodings in the System register encoding space:
MRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

G8.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see *The PMU event number space and common events* on page D11-5275.

**Configurations**

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

**Attributes**

PMCEID0 is a 32-bit register.

**Field descriptions**

| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9  | ID8  | ID7  | ID6  | ID5  | ID4  | ID3  | ID2  | ID1  | ID0  |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

ID<\(n\)>, bit [\(n\)], for \(n = 31\) to 0

ID[\(n\)] corresponds to Common event n.

For each bit:

\(0b0\) The Common event is not implemented, or not counted.

\(0b1\) The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

**Note**

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.
Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{c\}\{q\} \text{ <coproc>, \{#\}opc1, <Rt>, <CRn>, <CRm>\{, \{#\}opc2\}}
\]

<table>

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range \(0x0020\) to \(0x003F\).

For more information about the Common events and the use of the PMCEIDn registers see *The PMU event number space and common events* on page D11-5275.

**Configurations**

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

ID\(<n>\), bit \([n]\), for \(n = 31\) to \(0\)

ID[\(n\)] corresponds to Common event \((0x0020 + n)\).

For each bit:

- \(0b0\) The Common event is not implemented, or not counted.
- \(0b1\) The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

**Note**

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.
Such an event might be added retrospectively to an earlier version of the PMU architecture,

G8.4.5 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEIDn registers see *The PMU event number space and common events* on page D11-5275.

**Configurations**

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to External register PMCEID2[63:32].

This register is present only when AArch32 is supported and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are UNDEFINED.

**Attributes**

PMCEID2 is a 32-bit register.

<tr>
<td>IDhi0</td>
<td></td>
</tr>
</tbody>
</table>

IDhi<n> corresponds to Common event (0x4000 + n).

For each bit:

| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

**Note**

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.
Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn}, <CRm>{, {#}<opc2>}
```

<table>

G8.4.6 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEIDn registers see *The PMU event number space and common events on page D11-5275.*

**Configurations**

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to External register PMCEID3[63:32].

This register is present only when AArch32 is supported and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are UNDEFINED.

**Attributes**

PMCEID3 is a 32-bit register.

**Field descriptions**

**IDhi<n>, bit [n], for n = 31 to 0**

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- **Note** ---

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.
Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Accesses to this register use the following encodings in the System register encoding space:

\[ MRC\{c\}\{q\} \langle coproc \rangle, \langle \#\rangle\langle opc1 \rangle, \langle Rt \rangle, \langle CRn \rangle, \langle CRm \rangle\{\langle \#\rangle\langle opc2 \rangle\} \]

## G8.4.7 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR\(<n>\). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the PMCNTENSET register.

**Configurations**

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

**Attributes**

PMCNTENCLR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

<table>
<thead>
<tr>
<th>P&lt;(n&gt;), bit [n], for n = 30 to 0</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter disable bit for PMEVCNTR(&lt;n&gt;).</td>
<td></td>
</tr>
</tbody>
</table>

If \(N\) is less than 31, then bits [30:0] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \(N\) is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, \(N\) is the value in PMCR.N.

| 0b0 | When read, means that PMEVCNTR\(<n>\) is disabled. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR\(<n>\) is enabled. When written, disables PMEVCNTR\(<n>\). |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.4.8 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<\textless n\textgreater>. Reading this register shows which counters are enabled.

 PMCNTENSET is used in conjunction with the PMCNTENCLR register.

**Configurations**

AArch32 System register PMCNTENSET bits \([31:0]\) are architecturally mapped to AArch64 System register PMCNTENSET_EL0\([31:0]\).

AArch32 System register PMCNTENSET bits \([31:0]\) are architecturally mapped to External register PMCNTENSET_EL0\([31:0]\).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

**Attributes**

PMCNTENSET is a 32-bit register.

**Field descriptions**

![Field Diagram]

\(C\), bit \([31]\)

PMCCNTR enable bit. Enables the cycle counter register.

- \(0\): When read, means the cycle counter is disabled. When written, has no effect.
- \(1\): When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

\(P\textless n\textgreater\), bit \([n]\), for \(n = 30\) to \(0\)

Event counter enable bit for PMEVCNTR<\textless n\textgreater>.

If \(N\) is less than 31, then bits \([30:N]\) are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \(N\) is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, \(N\) is the value in PMCR.N.

- \(0\): When read, means that PMEVCNTR<\textless n\textgreater> is disabled. When written, has no effect.
- \(1\): When read, means that PMEVCNTR<\textless n\textgreater> event counter is enabled. When written, enables PMEVCNTR<\textless n\textgreater>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing PMCNTENSET

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}<\{q\}\} <\text{coproc}, \{<\text{opc}\}> <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{<\text{opc2}\}>\}
\]

**G8.4.9 PMCR, Performance Monitors Control Register**

The PMCR characteristics are:

** Purpose **
Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

** Configurations **
AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register PMCR_EL0[31:0].
AArch32 System register PMCR bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].
This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

** Attributes **
PMCR is a 32-bit register.

** Field descriptions **

</tbody>
</table>

** IMP, bits [31:24] **

*When FEAT_PMUv3p7 is not implemented:*
Implementer code.
If this field is zero, then PMCR.IDCODE is RES0 and software must use MIDR to identify the PE. Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR. Implementer.
Use of this field is deprecated.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

*Otherwise:*
Reserved, RAZ.

** IDCODE, bits [23:16] **

*When PMCR.IMP != 0b00000000000:*
Identification code. Use of this field is deprecated.
Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

*Otherwise:*
Reserved, RES0.
N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b0000 - 0b1111. If the value is 0b0000, then only PMCCNTR is implemented. If the value is 0b1111, then PMCCNTR and 31 event counters are implemented.

In an implementation that includes EL2:
- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of HDCR.HPMN.
- If EL2 is using AArch64 and is enabled in the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:
- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

0b0 Do not freeze on overflow.
0b1 Event counter PMEVCNTR<n> does not count when PMOVSR[(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].
This field does not affect the operation of other event counters and PMCCNTR.
The operation of this field applies even when EL2 is disabled in the current Security state.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:
- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

0b0 Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[31:0].
0b1 Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[63:0].
If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and PMCCNTR. PMEVCNTR[n][63:32] cannot be accessed directly in AArch32 state.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:
  • On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0  Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[31:0].

0b1  Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[63:0].

Arm deprecates use of PMCR.LC = 0.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DP, bit [5]**

*When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):*

Disable cycle counter when event counting is prohibited.

0b0  Cycle counting by PMCCNTR is not affected by this mechanism.

0b1  Cycle counting by PMCCNTR is disabled in prohibited regions and when event counting is frozen:

  • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and HDCR.HPMD is 1, then cycle counting by PMCCNTR is disabled at EL2.

  • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR is disabled at EL3.

  • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR.FZO, then cycle counting by PMCCNTR is disabled.

  • If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and either FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR is disabled at EL3 and in Secure state.

If HDCR.HPMN is not 0, this is when event counting by event counters in the range [0 .. (HDCR.HPMN-1)] is prohibited or frozen.

For more information, see *Prohibiting event and cycle counting* on page D11-5256.

The reset behavior of this field is:
  • On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.
X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

0b0  Do not export events.
0b1  Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

• On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

0b0  When enabled, PMCCNTR counts every clock cycle.
0b1  When enabled, PMCCNTR counts once every 64 clock cycles.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

The reset behavior of this field is:

• On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

0b0  No action.
0b1  Reset PMCCNTR to zero.

Note

Resetting PMCCNTR does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

In the description of this field:

• If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
• If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
• If EL2 is not implemented, PMN is PMCR.N.
0b0  No action.
0b1  If n is in the range of affected event counters, resets each event counter PMEVCNTR<n> to zero.

The effects of writing to this bit are:

• If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
• If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
In EL2 and EL3, a write of 1 to this bit resets all the event counters.

This field does not affect the operation of other event counters and PMCCNTR.

--- Note ---
Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of HDCR.HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

**E, bit [0]**

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

0b0 PMCCNTR is disabled and event counters PMEVCNTR<n>, where n is in the range of affected event counters, are disabled.

0b1 PMCCNTR and event counters PMEVCNTR<n> where n is in the range of affected event counters, are enabled by PMCNTENSET.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

G8.4.10 PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configurations**

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0].

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

**Attributes**

PMEVCNTR<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter n</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing PMEVCNTR<n>**

PMEVCNTR<n> can also be accessed by using PMXEVcntr with PMSELr.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVCNTR<n> is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if\(<n>\) is an\(\text{UNKNOWN}\) value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and \(<n>\) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR.\{ER,EN\} or PMUSERENR_EL0.\{ER,EN\}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>\{<\#>\text{opc1}>\}, <Rt>, <CRn>, <CRm>\{<\#>\text{opc2}>\}
\]

G8.4.11 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions

The following table describes the bits in PMEVTYPER<n>:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Description</th>
<th>Value</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>Privileged filtering bit</td>
<td>P</td>
<td>Controls counting in EL1.</td>
</tr>
<tr>
<td>29</td>
<td>User filtering bit</td>
<td>U</td>
<td>Controls counting in EL0.</td>
</tr>
<tr>
<td>28</td>
<td>Non-secure EL1 (kernel) modes filtering bit</td>
<td>NSK</td>
<td>Controls counting in Non-secure EL1.</td>
</tr>
<tr>
<td>27</td>
<td>normals</td>
<td>RESO</td>
<td></td>
</tr>
<tr>
<td>26</td>

<td>evtCount[15:10]</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>event counter</td>
<td>evtCount[9:0]</td>
<td></td>
</tr>
</tbody>
</table>

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>.NSK bit.

0b0 Count events in EL1.
0b1 Do not count events in EL1.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>.RLU bit.

0b0 Count events in EL0.
0b1 Do not count events in EL0.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<\(n\).U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

- 0b0: Do not count events in EL2.
- 0b1: Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [26]**

Reserved, RES0.

**MT, bit [25]**

*When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:*

Multithreading.

- 0b0: Count events only on controlling PE.
- 0b1: Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See ID_DFR1.MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:22]**

Reserved, RES0.
RLU, bit [21]

When **FEAT_RME** is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

Bits [20:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When **FEAT_PMUv3p1** is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<n>.

The ranges of event numbers allocated to each type of event are shown in Table D11-7 on page D11-5275.

If **FEAT_PMUv3p8** is implemented and PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

—— Note

Arm recommends this behavior for all implementations of **FEAT_PMUv3**.

—— Note

Otherwise, if PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

• For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

• If **FEAT_PMUv3p1** is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

• For other values, it is **UNPREDICTABLE** what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is **UNKNOWN**.

—— Note

**UNPREDICTABLE** means the event must not expose privileged information.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing PMEVTYPER<\text{n}>

PMEVTYPER<\text{n}> can also be accessed by using PMXEVTYPER with PMSELR.SEL set to \text{n}.

If \text{FEAT_FGT} is implemented and \text{<n>} is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<\text{n}> is as follows:

- If \text{<n>} is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If \text{FEAT_FGT} is not implemented and \text{<n>} is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<\text{n}> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if \text{<n>} is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and \text{<n>} is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

\text{Note}

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

\text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>}}

G8.4.12 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the PMINTENSET register.

**Configurations**

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when EL1 is capable of using AArch32 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

**Attributes**

PMINTENCLR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td><strong>PMCCNTR</strong> overflow interrupt request disable bit.</td>
</tr>
<tr>
<td></td>
<td>0:0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td></td>
<td>0:1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
<tr>
<td>P&lt;n&gt;</td>
<td><strong>PMEVCNTR&lt;n&gt;</strong> event counter overflow interrupt request disable bit for PMEVCNTR&lt;n&gt;.</td>
</tr>
</tbody>
</table>

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

0:0 When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect.
When read, means that the PMEVCNTR<\text{n}> event counter interrupt request is enabled.
When written, disables the PMEVCNTR<\text{n}> interrupt request.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

### Accessing PMINTENCLR

G8.4.13  PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the PMINTENCLR register.

Configurations

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when EL1 is capable of using AArch32 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>C, bit [31]</th>
<th>PMCCNTR overflow interrupt request enable bit.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

<table>
<thead>
<tr>
<th>P&lt;n&gt;, bit [n], for n = 30 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter overflow interrupt request enable bit for PMEVCNTR&lt;n&gt;.</td>
</tr>
</tbody>
</table>

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDRR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

<table>
<thead>
<tr>
<th>0b0</th>
<th>When read, means that the PMEVCNTR&lt;n&gt; event counter interrupt request is disabled. When written, has no effect.</th>
</tr>
</thead>
</table>
0b1 When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, enables the PMEVCNTR<n> interrupt request.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.4.14  PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

**Configurations**

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

**Attributes**

PMOVSR is a 32-bit register.

**Field descriptions**

C, bit [31]

Cycle counter overflow clear bit. Possible values are:

0b0  When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1  When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

0b0  When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.
0b1 When read, means that PMEVCNTR<n> has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n> overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing PMOVSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

G8.4.15 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR\(<n>\).

**Configurations**

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

**Attributes**

PMOVSSET is a 32-bit register.

**Field descriptions**

**C, bit [31]**

Cycle counter overflow set bit.

- **0b0** When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
- **0b1** When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

**PMCR.LC** controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P\(<n>\), bit [n], for n = 30 to 0**

Event counter overflow set bit for PMEVCNTR\(<n>\).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

- **0b0** When read, means that PMEVCNTR\(<n>\) has not overflowed since this bit was last cleared. When written, has no effect.
When read, means that PMEVCNTR<n> has overflowed since this bit was last. When written, sets the PMEVCNTR<n> overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.4.16 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter PMEVCNTR<\text{n}> or the cycle counter, CCNT. PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments. It is also used in conjunction with PMXEVCNTR, to determine the value of a selected event counter.

Configurations

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

G8.4.17 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x0. For more information, see SW_INCR.

**Configurations**

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

**Attributes**

PMSWINC is a 32-bit register.

**Field descriptions**

![Register Diagram]

**Bit [31]**

Reserved, RES0.

**P<\text{n}>, bit [\text{n}], for \text{n} = 30 to 0**

Event counter software increment bit for PMEVCNTR<\text{n}>.

If N is less than 31, then bits [30:N] are WE. When EL2 is implemented and enabled in the current Security state, EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

0b0 No action. The write to this bit is ignored.

0b1 If PMEVCNTR<\text{n}> is enabled and configured to count the software increment event, increments PMEVCNTR<\text{n}> by 1. If PMEVCNTR<\text{n}> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

**Accessing PMSWINC**

Accesses to this register use the following encodings in the System register encoding space:
if PSTATE.EL == EL0 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && !ELUsingAArch32(EL3) && MDCR_EL3.TPM == '1' then
    UNDEFINED;
  elif !EL2Enabled() && PMUSERENR_EL0.<SW,EN> == '00' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    else
      AArch64.AArch32SystemAccessTrap(EL1, 0x03);
    endif
  else
    UNDEFINED;
  endif
else
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T9 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    AArch64.AArch32SystemAccessTrap(EL3, 0x03);
  endif
endif
UNDEFINED;
else
  AArch64.AArch32SystemAccessTrap[EL3, 0x03];
else
  PMSWINC = R[t];
elsif PSTATE.EL == EL3 then
  PMSWINC = R[t];
G8.4.18 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

**Purpose**

Enables or disables User mode access to the Performance Monitors.

**Configurations**

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

**Attributes**

PMUSERENR is a 32-bit register.

**Field descriptions**

G8.4.19  PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

Purpose
Reads or writes the value of the selected event counter, PMEVCNTR<n>. PMSELR.SEL determines which event counter is selected.

Configurations
AArch32 System register PMXEVCNTR bits [31:0] are architecturally mapped to AArch64 System register PMXEVCNTR_EL0[31:0].
This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

Attributes
PMXEVCNTR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMEVCNTR&lt;n&gt;</td>
<td></td>
</tr>
</tbody>
</table>

PMEVCNTR<n>, bits [31:0]
Value of the selected event counter, PMEVCNTR<n>, where n is the value stored in PMSELR.SEL.
If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:
• Reads from PMXEVCNTR return bits [31:0] of the counter.
• Writes to PMXEVCNTR update bits [31:0] and leave bits [63:32] unchanged.
• There is no means to access bits [63:32] directly from AArch32 state.
• If the implementation does not support AArch64, bits [63:32] are not required to be implemented.
If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR
If FEAT_FGT is implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVCNTR is as follows:
• If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
• Otherwise, the access is trapped to EL2.
If FEAT_FGT is not implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:
• Accesses to the register are UNDEFINED.
• Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP
• Accesses to the register behave as if PMSEL.R.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.

• If EL2 is implemented and enabled in the current Security state, and PMSEL.R.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.ER or PMUSERENR_EL0.ER.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

• If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.

• If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC<coproc><CRn><CRm> <coproc>, CRn>, <CRm>}}

G8.4.20 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

**Purpose**

When PMSELR.SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR.SEL selects the cycle counter, this accesses PMCCFILTR.

**Configurations**

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register PMXEVTYPER_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

**Attributes**

PMXEVTYPER is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event type register or PMCCFILTR</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event type register or PMCCFILTR.

When PMSELR.SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR.SEL.

**Accessing PMXEVTYPER**

If FEAT_FGT is implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVTYPER is as follows:

- If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a **NOP**
- Accesses to the register behave as if PMSELR.SEL has an **UNKNOWN** value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.
If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} {<coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}
```

G8.5  Activity Monitors registers

This section lists the Activity Monitoring registers in AArch32.
G8.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCG</td>
<td>Defines the number of counter groups. The number of implemented counter groups is [AMCFGR.NCG + 1]. If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>HDBG</td>
<td>Halt-on-debug supported. This feature must be supported, and so this bit is 0b1. 0b0 AMCR.HDBG is RES0. 0b1 AMCR.HDBG is read/write. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
<tr>
<td>RAZ</td>
<td>Reserved, RAZ.</td>
</tr>
<tr>
<td>SIZE</td>
<td>Defines the size of activity monitor event counters.</td>
</tr>
</tbody>
</table>

NCG, bits [31:28]

HDBG, bit [24]
The size of the activity monitor event counters implemented by the Activity Monitors Extension is \([\text{AMCFGR.SIZE} + 1]\). The counters are 64-bit.

--- Note ---
Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

---
Reads as 0b1111111.
Access to this field is RO.

**N, bits [7:0]**
Defines the number of activity monitor event counters.
The total number of counters implemented in all groups by the Activity Monitors Extension is \([\text{AMCFGR.N} + 1]\).
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

### Accessing AMCFGR
Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{c\}\{q\} <\text{coproc}, \{\#\}<\text{opc1}, <\text{Rt}, <\text{CRn}, <\text{CRm}\}, \{\#\}<\text{opc2}>
\]

G8.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configurations**

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

![AMCGCR Register Diagram]

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group. In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group. Reads as 0x04. Access to this field is RO.

**Accessing AMCGCR**

Accesses to this register use the following encodings in the System register encoding space:

### G8.5.3 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected activity monitors event counters, `AMEVCTR0<n>`.

**Configurations**

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register `AMCNTENCLR0_EL0[31:0]`.

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register `AMCNTENCLR0[31:0]`.

This register is present only when `FEAT_AMUv1` is implemented. Otherwise, direct accesses to AMCNTENCLR0 are **UNDEFINED**.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>RAZ/WI</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td>RAZ/WI</td>
<td>P3</td>
<td>P2</td>
<td>P1</td>
<td>P0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, `RES0`.

**Bits [15:4]**

Reserved, `RAZ/WI`.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

**P<n>, bit [n], for n = 3 to 0**

Activity monitor event counter disable bit for `AMEVCTR0<n>`.

**Note**

`AMCGCR.CG0NC` identifies the number of architected activity monitor event counters. In an implementation that includes `FEAT_AMUv1`, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- 0b0 When read, means that `AMEVCTR0<n>` is disabled. When written, has no effect.
- 0b1 When read, means that `AMEVCTR0<n>` is enabled. When written, disables `AMEVCTR0<n>`.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

**Accessing AMCNTENCLR0**

Accesses to this register use the following encodings in the System register encoding space:
if PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' & boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" & !ELUsingAArch32(EL3) && CPTR_EL3.TAM == '1' then UNDEFINED;

G8.5.4  AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

**Purpose**

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configurations**

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>. When N is less than 16, bits [15:N] are RAZ/WI, where N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

0b0  When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.

0b1  When read, means that AMEVCNTR1<n> is enabled. When written, disables AMEVCNTR1<n>.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

**Accessing AMCNTENCLR1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are UNDEFINED.

--- Note ---

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

G8.5.6 AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configurations**

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>16-1</td>
<td>Reserved.</td>
</tr>
<tr>
<td>n</td>
<td>Activity monitor event counter enable bit for AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

When N is less than 16, bits [15:N] are RAZ/WI, where N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

- 0b0: When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
- 0b1: When read, means that AMEVCNTR1<n> is enabled. When written, enables AMEVCNTR1<n>.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

**Accessing AMCNTENSET1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are UNDEFINED.

--- Note ---

The number of auxiliary activity monitor counters implemented is zero when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:
MRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

G8.5.7  **AMCR, Activity Monitors Control Register**

The AMCR characteristics are:

**Purpose**

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

**Configurations**

AArch32 System register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0].

AArch32 System register AMCR bits [31:0] are architecturally mapped to External register AMCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

**Attributes**

AMCR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-18</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>17</td>
<td>CG1RZ</td>
</tr>
<tr>
<td>16-11</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>10</td>
<td>HDBG</td>
</tr>
</tbody>
</table>

**Bits [31:18]**

Reserved, RES0.

**CG1RZ, bit [17]**

*When FEAT_AMUv1p1 is implemented:*

Counter Group 1 Read Zero.

- **0b0**  
  System register reads of AMEVCNTR1<n> return the event count at all implemented and enabled Exception levels.

- **0b1**  
  If the current Exception level is the highest implemented Exception level, system register reads of AMEVCNTR1<n> return the event count. Otherwise, reads of AMEVCNTR1<n> return a zero value.

**Note**

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [16:11]**

Reserved, RES0.

**HDBG, bit [10]**

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

- **0b0**  
  Activity monitors do not halt counting when the PE is halted in Debug state.

- **0b1**  
  Activity monitors halt counting when the PE is halted in Debug state.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [9:0]**

Reserved, RES0.

**Accessing AMCR**

Accesses to this register use the following encodings in the System register encoding space:

\[
MRC\{<c>\}/\{q\} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}
\]

G8.5.9 AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

**Purpose**

Provides access to the auxiliary activity monitor event counters.

**Configurations**

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to External register AMEVCNTR1<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are UNDEFINED.

**Attributes**

AMEVCNTR1<n> is a 64-bit register.

**Field descriptions**

```
<table>
<thead>
<tr>
<th>63</th>
<th>ACNT</th>
</tr>
</thead>
</table>
```

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, EL2 is using AArch64 and is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

**Accessing AMEVCNTR1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are UNDEFINED.

--- Note ---

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

G8.5.10  AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

**Configurations**

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

**Attributes**

AMEVTYPER0<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>15</td>
<td>evtCount</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>Event Number</th>
<th>Event Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0011</td>
<td>Processor frequency cycles</td>
</tr>
<tr>
<td>0x4004</td>
<td>Constant frequency cycles</td>
</tr>
<tr>
<td>0x0008</td>
<td>Instructions retired</td>
</tr>
<tr>
<td>0x4005</td>
<td>Memory stall cycles</td>
</tr>
</tbody>
</table>

**Accessing AMEVTYPER0<n>**

AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

**Purpose**

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

**Configurations**

AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register AMUSERENR_EL0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

**Attributes**

AMUSERENR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>EN, control bit.</td>
</tr>
</tbody>
</table>

**EN, bit [0]**

Traps EL0 accesses to the activity monitors registers to EL1.

0b0: EL0 accesses to the activity monitors registers are trapped to EL1.

0b1: This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

**Note**

- AMUSERENR can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing AMUSERENR**

Accesses to this register use the following encodings in the System register encoding space:

\[ MRC\langle c\rangle\langle q\rangle <\text{coproc}, \langle\#\rangle<\text{opc}1>, \langle RT\rangle, <\text{CRn}>, <\text{CRm}>, \langle\#\rangle<\text{opc}2> \]

G8.6 RAS registers

This section lists The Reliability, Availability, and Serviceability Extension registers in AArch32.
### G8.6.1 DISR, Deferred Interrupt Status Register

The DISR characteristics are:

**Purpose**

Records that an SError interrupt has been consumed by an E58 instruction.

**Configurations**

AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register DISR_EL1[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

**Attributes**

DISR is a 32-bit register.

**Field descriptions**

*When the ESB instruction is executed at EL2:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| A     | Set to 1 when an E58 instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| Bits [30:12] | Reserved, RES0. |
| AET     | Asynchronous Error Type. See the description of HSR.AET for an SError interrupt. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| EA      | External abort Type. See the description of HSR.EA for an SError interrupt. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| Bits [8:6] | Reserved, RES0. |
| DFSC    | Fault Status Code. See the description of HSR.DFSC for an SError interrupt. The reset behavior of this field is:  
  - On a Warm reset, this field resets to an architecturally UNKNOWN value. |
When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:

<table>
<thead>
<tr>
<th>A</th>
<th>RES0</th>
<th>AET</th>
<th>RES0</th>
<th>FS[3:0]</th>
<th>RES0</th>
<th>LPAE</th>
<th>FS[4]</th>
<th>RES0</th>
</tr>
</thead>
</table>

A, bit [31]
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]
Reserved, RES0.

AET, bits [15:14]
Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]
Reserved, RES0.

ExT, bit [12]
External abort Type. See the description of DFSR.ExT for an SError interrupt.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]
Reserved, RES0.

FS, bits [10, 3:0]
Fault Status Code. See the description of DFSR.FS for an SError interrupt.

The FS field is split as follows:
• FS[4] is DISR[10].
• FS[3:0] is DISR[3:0].

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]
Format.

0b0 Using the Short-descriptor translation table format.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]
Reserved, RES0.
When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 1:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>

<td></td>
</tr>
</tbody>
</table>

A, bit [31]
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]
Reserved, RES0.

AET, bits [15:14]
Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]
Reserved, RES0.

ExT, bit [12]
External abort Type. See the description of DFSR.ExT for an SError interrupt.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]
Reserved, RES0.

LPAE, bit [9]

Format.
0b1 Using the Long-descriptor translation table format.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]
Reserved, RES0.

STATUS, bits [5:0]
Fault Status Code. See the description of DFSR.FS for an SError interrupt.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR
An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.
DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, SCR_EL3.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and ((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0).

- EL3 is using AArch32, SCR.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and (SCR.NS == 0 || HCR.AMO == 0).

Accesses to this register use the following encodings in the System register encoding space:

\[
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
\]

<table>

G8.6.2 ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

**Purpose**
Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configurations**
AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register ERRIDR_EL1[31:0].
This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR are UNDEFINED.

**Attributes**
ERRIDR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>NUM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**
Reserved, RES0.

**NUM, bits [15:0]**
Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.
Each implemented record is owned by a node. A node might own multiple records.

**Accessing ERRIDR**
Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rp}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

G8.6.3   ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configurations**

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register ERRSEL_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If ERRIDR indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

**Attributes**

ERRSELR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15–16</td>
<td>SEL, bits [15:0]</td>
</tr>
</tbody>
</table>

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is 0x0004, then direct reads and writes of ERXSTATUS access ERR4STATUS.

If ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
  - An **UNKNOWN** error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing ERRSELR**

Accesses to this register use the following encodings in the System register encoding space:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then

G8.6.4 ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<\text{n}>ADDR for the error record <\text{n}> selected by ERRSELR.SEL.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

**Configurations**

AArch32 System register ERXADDR bits [31:0] are architecturally mapped to AArch64 System register ERXADDR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

**Attributes**

ERXADDR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:0] of ERR&lt;\text{n}&gt;ADDR</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing ERXADDR**

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

ERR<\text{n}>ADDR describes additional constraints that also apply when ERR<\text{n}>ADDR is accessed through ERXADDR.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}, \{#/}\text{opc1}, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \{#/\text{opc2}\}}
\]

\[
\begin{array}{ccccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
\hline
0b1111 & 0b000 & 0b0101 & 0b0100 & 0b011 \\
\end{array}
\]

G8.6.5 ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR\(<n>\)ADDR for the error record \(<n>\) selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXADDR2 bits [31:0] are architecturally mapped to AArch64 System register ERXADDR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

**Attributes**

ERXADDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERXADDR2 accesses bits [63:32] of ERR(&lt;n&gt;)ADDR, where (&lt;n&gt;) is the value in ERRSELR.SEL.</td>
</tr>
</tbody>
</table>

**Accessing ERXADDR2**

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are UNDEFINED.

ERR\(<n>\)ADDR describes additional constraints that also apply when ERR\(<n>\)ADDR is accessed through ERXADDR2.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

**Attributes**

ERXCTLR is a 32-bit register.

**Field descriptions**

```
+----+----+
\    \  
| 31 | 0  |
\    \  
+----+----+
```

Bits [31:0] of ERR<n>CTRLR

ERXCTLR accesses bits [31:0] of ERR<n>CTRLR, where <n> is the value in ERRSEL.R.SEL.

**Accessing ERXCTLR**

If ERRIDR.NUM is 0x0000 or ERRSEL.R.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR is RAZ/WI.
- Direct reads and writes of ERXCTLR are NOPs.
- Direct reads and writes of ERXCTLR are UNDEFINED.

If ERRSEL.R.SEL is not the index of the first error record owned by a node, then ERR<n>CTRLR[31:0] is not present, meaning reads and writes of ERXCTLR are RES0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

if PSTATE.EL == EL0 then

G8.6.7   ERXCTLR2, Selected Error Record Control Register 2

The ERXCTLR2 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<n>CTLR for the error record <n> selected by ERRSEL.R.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXCTLR2 bits [31:0] are architecturally mapped to AArch64 System register ERXCTLR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR2 are UNDEFINED.

**Attributes**

ERXCTLR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERXCTLR2 accesses bits [63:32] of ERR&lt;n&gt;CTLR, where &lt;n&gt; is the value in ERRSEL.R.SEL.</td>
</tr>
</tbody>
</table>

**Accessing ERXCTLR2**

If ERRIDR.NUM is 0x0000 or ERRSEL.R.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR2 is RAZ/WI.
- Direct reads and writes of ERXCTLR2 are NOPs.
- Direct reads and writes of ERXCTLR2 are UNDEFINED.

If ERRSEL.R.SEL is not the index of the first error record owned by a node, then ERR<n>CTLR[63:32] is not present, meaning reads and writes of ERXCTLR2 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

G8.6.8 ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>FR for the error record <n> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXFR bits [31:0] are architecturally mapped to AArch64 System register ERXFR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

**Attributes**

ERXFR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
<td>ERXFR accesses bits [31:0] of ERR&lt;n&gt;FR, where &lt;n&gt; is the value in ERRSELR.SEL.</td>
</tr>
</tbody>
</table>

**Accessing ERXFR**

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXFR is RAZ.
- Direct reads of ERXFR are NOPs.
- Direct reads of ERXFR are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}\}
\]

ERXFR2, Selected Error Record Feature Register 2

The ERXFR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>FR for the error record <n> selected by ERRSEL.R.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

Configurations

AArch32 System register ERXFR2 bits [31:0] are architecturally mapped to AArch64 System register ERXFR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXFR2 are UNDEFINED.

Attributes

ERXFR2 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bits [63:32] of ERR&lt;n&gt;FR</th>
</tr>
</thead>
</table>

Bits [31:0]

ERXFR2 accesses bits [63:32] of ERR<n>FR, where <n> is the value in ERRSEL.R.SEL.

Accessing ERXFR2

If ERRIDR.NUM is 0x0000 or ERRSEL.R.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

• An UNKNOWN error record is selected.
• ERXFR2 is RAZ.
• Direct reads of ERXFR2 are NOPs.
• Direct reads of ERXFR2 are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

\[ MRC\{<c>\}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} \]

G8.6.13 ERXMISC3, Selected Error Record Miscellaneous Register 3

The ERXMISC3 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<n>MISC1 for the error record <n> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXMISC3 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC1_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC3 are UNDEFINED.

**Attributes**

ERXMISC3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:32] of ERR&lt;n&gt;MISC1</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
</tr>
</tbody>
</table>

ERXMISC3 accesses bits [63:32] of ERR<n>MISC1, where <n> is the value in ERRSELR.SEL.

**Accessing ERXMISC3**

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC3 is RAZ/WI.
- Direct reads and writes of ERXMISC3 are NOPs.
- Direct reads and writes of ERXMISC3 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC3.

Accesses to this register use the following encodings in the System register encoding space:

\[ \text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}} \]

G8.6.14 ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>MISC2 for the error record <n> selected by ERRSELR.SEL.
For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification,
Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXMISC4 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[31:0].
This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

**Attributes**

ERXMISC4 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:0] of ERR&lt;n&gt;MISC2</th>
</tr>
</thead>
</table>

ERXMISC4 accesses bits [31:0] of ERR<n>MISC2, where <n> is the value in ERRSELR.SEL.

**Accessing ERXMISC4**

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings in the System register encoding space:

```plaintext
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

G8.6.15 ERXMISC5, Selected Error Record Miscellaneous Register 5

The ERXMISC5 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<n>MISC2 for the error record <n> selected by ERRSEL.R.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXMISC5 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC5 are UNDEFINED.

**Attributes**

ERXMISC5 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:32] of ERR&lt;n&gt;MISC2</th>
</tr>
</thead>
</table>

**Accessing ERXMISC5**

If ERRIDR.NUM is 0x0000 or ERRSEL.R.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC5 is RAZ/WI.
- Direct reads and writes of ERXMISC5 are NOPs.
- Direct reads and writes of ERXMISC5 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC5.

Accesses to this register use the following encodings in the System register encoding space:

$$\text{MRC} \{<c>\} \{<q>\} <\text{coproc}>, \{<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{<\text{opc2}>\}$$

G8.6.17    ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC3 for the error record <n> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

Configurations

AArch32 System register ERXMISC7 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are UNDEFINED.

Attributes

ERXMISC7 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Bits [63:32] of ERR&lt;n&gt;MISC3</td>
</tr>
</tbody>
</table>

Bits [31:0]

ERXMISC7 accesses bits [63:32] of ERR<n>MISC3, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC7

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC7 is RAZ/WI.
- Direct reads and writes of ERXMISC7 are NOPs.
- Direct reads and writes of ERXMISC7 are UNDEFINED.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC7.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC\{<c>\}\{<q>\} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

ERXSTATUS, Selected Error Record Primary Status Register

The ERXSTATUS characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>STATUS for the error record selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXSTATUS bits [31:0] are architecturally mapped to AArch64 System register ERXSTATUS_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXSTATUS are UNDEFINED.

**Attributes**

ERXSTATUS is a 32-bit register.

**Field descriptions**

Bits [31:0]

ERXSTATUS accesses bits [31:0] of ERR<n>STATUS, where n is the value in ERRSELR.SEL.

**Accessing ERXSTATUS**

If ERRIDR.NUM == 0 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN record is selected.
- ERXSTATUS is RAZ/WI.
- Direct reads and writes of ERXSTATUS are NOPs.
- Direct reads and writes of ERXSTATUS are UNDEFINED.

G8.6.19   VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an E58 instruction at EL1.

When the virtual SError interrupt injected using HCR.VA is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.{AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see Chapter G5 The AArch32 Virtual Memory System Architecture.

If the virtual SError interrupt injected using HCR.VA is deferred by an E58 instruction, then the syndrome value is written to VDISR.

**Configurations**

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register VSESR_EL2[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

**Attributes**

VDFSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>[31:16]</td>
</tr>
<tr>
<td>AET</td>
<td>[15:14]</td>
</tr>
<tr>
<td>RES0</td>
<td>[13:0]</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**AET, bits [15:14]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:14] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an E58 instruction, VDISR[15:14] is set to VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an E58 instruction, VDISR[12] is set to VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:0]**

Reserved, RES0.
Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

\[ MRC\{<c>\}{<q>} \{<opc1>, <Rt>, <CRn>, <CRm>\}{, {#}<opc2>} \]

G8.6.20  VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an E58 instruction.

Configurations

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register VDISR_EL2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

A, bit [31]

Set to 1 when an E58 instruction defers a virtual SError interrupt.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.
FS, bits [10, 3:0]
Fault status code. Set to 0b10110 when an E58 instruction defers a virtual SError interrupt.

0b10110  Asynchronous SError interrupt.
All other values are reserved.
The FS field is split as follows:
• FS[4] is VDISR[10].
• FS[3:0] is VDISR[3:0].
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]
Format.
Set to TTBCR.EAE when an E58 instruction defers a virtual SError interrupt.
0b0  Using the Short-descriptor translation table format.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]
Reserved, RES0.

When TTBCR.EAE == 1:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A, bit [31]
Set to 1 when an E58 instruction defers a virtual SError interrupt.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]
Reserved, RES0.

AET, bits [15:14]
The value copied from VDFS.R.AET.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]
Reserved, RES0.

ExT, bit [12]
The value copied from VDFS.R.ExT.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]
Reserved, RES0.
LPAE, bit [9]

   Format.
   Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.
   0b1   Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

   Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.
   0b010001   Asynchronous SError interrupt.
   All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc}>\ ,\ (<#>\text{opc1})\ ,\ (<Rt>)\ ,\ (<CRn>)\ ,\ (<CRm>)\ ,\ (<#>\text{opc2})
\]

\[
\begin{array}{cccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
0b1111 & 0b100 & 0b100 & 0b0001 & 0b001 \\
\end{array}
\]

G8.7  Generic Timer registers

This section lists the Generic Timer registers in AArch32.
### G8.7.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

#### Purpose
This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

#### Configurations
AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register CNTFRQ_EL0[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

#### Attributes
CNTFRQ is a 32-bit register.

#### Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clock frequency</td>
<td></td>
</tr>
</tbody>
</table>

#### Bits [31:0]
Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTFRQ**

Accesses to this register use the following encodings in the System register encoding space:

\[
MRC\langle c\rangle\langle q\rangle \langle coproc\rangle, \langle \#\rangle\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \langle \#\rangle\langle opc2\rangle
\]

<table>
<thead>

if IsHighestEL(PSTATE.EL) then
  CNTFRQ = R[t];
else
  UNDEFINED;
G8.7.2 CNGTHCTL, Counter-timer Hyp Control register

The CNGTHCTL characteristics are:

**Purpose**
Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

**Configurations**
AArch32 System register CNGTHCTL bits [31:0] are architecturally mapped to AArch64 System register CNGTHCTL_EL2[31:0].
This register is present only when EL2 is capable of using AArch32. Otherwise, direct accesses to CNGTHCTL are UNDEFINED.
If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**
CNGTHCTL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>17</td>
<td>EVNTIS, bit [17]</td>
</tr>
<tr>
<td>8-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-4</td>
<td>EVNTI, bits [7:4]</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**EVNTIS, bit [17]**
*When FEAT_ECV is implemented:*
- 0: The CNGTHCTL.EVNTI field applies to CNTPCT[15:0].
- 1: The CNGTHCTL.EVNTI field applies to CNTPCT[23:8].
The reset behavior of this field is:
  - On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
- Reserved, RES0.

**Bits [16:8]**
- Reserved, RES0.

**EVNTI, bits [7:4]**
Selects which bit of CNTPCT, as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.
If FEAT_ECV is implemented, and CNGTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTPCT.
Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTPCT.
The reset behavior of this field is:
  - On a Warm reset, this field resets to an architecturally UNKNOWN value.
**EVNTDIR, bit [3]**

Controls which transition of the CNTPCT trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

- **0b0** A 0 to 1 transition of the trigger bit triggers an event.
- **0b1** A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from CNTPCT as seen from EL2.

- **0b0** Disables the event stream.
- **0b1** Enables the event stream.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL1PCEN, bit [1]**

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

- **0b0** Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVVAL are trapped to Hyp mode, unless the it is trapped by CNTKCTL.PL0PTEN.
- **0b1** This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL1PCTEN, bit [0]**

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

- **0b0** Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode, unless it is trapped by CNTKCTL.PL0PCTEN.
- **0b1** This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing CNTHCTL

  else
    CNTHCTL = R[t];
G8.7.3 CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

Purpose
Control register for the Hyp mode physical timer.

Configurations
AArch32 System register CNTHP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_CTL_EL2[31:0].
This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHP_CTL are UNDEFINED.
If EL2 is not implemented, this register is RES0 from EL3.

Attributes
CNTHP_CTL is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:3</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| 2 | ISTATUS, bit [2]
The status of the timer. This bit indicates whether the timer condition is met:
0b0 Timer condition is not met.
0b1 Timer condition is met.
When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.
When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value. Access to this field is RO.

| 1 | IMASK, bit [1]
Timer interrupt mask bit. Permitted values are:
0b0 Timer interrupt is not masked by the IMASK bit.
0b1 Timer interrupt is masked by the IMASK bit.
For more information, see the description of the ISTATUS bit.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

| 0 | ENABLE, bit [0]
Enables the timer. Permitted values are:
0b0 Timer disabled.
0b1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TV continues to count down.

______ Note ________
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:
• On a Warm reset:
  — When the PE resets into EL2 or EL3, this field resets to 0.
  — Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CTL

G8.7.4 CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

**Purpose**

Holds the compare value for the Hyp mode physical timer.

**Configurations**

AArch32 System register CNTHP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CVAL is a 64-bit register.

**Field descriptions**

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTHP_CVAL**

Accesses to this register use the following encodings in the System register encoding space:

\[ \text{MRRC}\{\text{c}\}\{\text{q}\} \langle\text{coproc}\rangle, \langle\#\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{Rt2}\rangle, \langle\text{CRm}\rangle \]

G8.7.5   CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_TVAL is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td></td>
</tr>
</tbody>
</table>

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_TVAL

Accesses to this register use the following encodings in the System register encoding space:

G8.7.6 CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

**Configurations**

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are UNDEFINED.

**Attributes**

CNTHPS_CTL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:3]</td>
<td>Reserved, RES0</td>
<td>0x0</td>
</tr>
<tr>
<td>[2]</td>
<td>ISTATUS, bit [2]</td>
<td>0b0, 0b1</td>
</tr>
<tr>
<td>[1]</td>
<td>IMASK, bit [1]</td>
<td>0b0, 0b1</td>
</tr>
<tr>
<td>[0]</td>
<td>ENABLE, bit [0]</td>
<td>0b0, 0b1</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

- **0b0**: Timer condition is not met.
- **0b1**: Timer condition is met.

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

- **0b0**: Timer interrupt is not masked by the IMASK bit.
- **0b1**: Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

- **0b0**: Timer disabled.
- **0b1**: Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS_TV AL_EL2 continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTHPS_CTL**

This register is accessed using the encoding for CNTP_CTL.

Accesses to this register use the following encodings in the System register encoding space:

\[
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
\]

G8.7.7  CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

**Configurations**

AArch32 System register CNTHPS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHPS_CVAL_EL2[63:0].

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

**Attributes**

CNTHPS_CVAL is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CompareValue</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTHPS_CVAL**

This register is accessed using the encoding for CNTP_CVAL.

Accesses to this register use the following encodings in the System register encoding space:
MRRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>

G8.7.8  **CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)**

The CNTHPS_TVAL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

**Configurations**

AArch32 System register CNTHPS_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_TVAL_EL2[31:0].

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

**Attributes**

CNTHPS_TVAL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td></td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- **CNTHPS_CTL_EL2.ISTATUS** is set to 1.
- **If CNTHPS_CTL_EL2.IMASK** is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTHPS_TVAL**

This register is accessed using the encoding for CNTP_TVAL.

Accesses to this register use the following encodings in the System register encoding space:
MRC\{c\}\{q\} \{coproc\}, \{#\}\{opc1\}, <Rt>, <CRn>, <CRm>, \{#\}\{opc2\}

G8.7.9   **CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)**

The CNTHV_CTL characteristics are:

**Purpose**

Provides AArch32 access to the control register for the EL2 virtual timer.

**Configurations**

AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_CTL_EL2[31:0].

This register is present only when AArch32 is supported and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

**Attributes**

CNTHV_CTL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS, bit [2]</td>
</tr>
<tr>
<td>2</td>
<td>ENABLE, bit [0]</td>
</tr>
<tr>
<td>1</td>
<td>IMASK, bit [1]</td>
</tr>
</tbody>
</table>

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:
- 0b0: Timer condition is not met.
- 0b1: Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted. When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:
- 0b0: Timer interrupt is not masked by the IMASK bit.
- 0b1: Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:
- 0b0: Timer disabled.
- 0b1: Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from
**CNTHV_TVAL** continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing CNTHV_CTL**

This register is accessed using the encoding for **CNTV_CTL**.

Accesses to this register use the following encodings in the System register encoding space:

**MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}**

G8.7.10 CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the EL2 virtual timer.

**Configurations**

AArch32 System register CNTHV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHV_CVAL_EL2[63:0]. This register is present only when AArch32 is supported and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

**Attributes**

CNTHV_CVAL is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:
- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing CNTHV_CVAL**

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

```
<table>
<thead>
<tr>
<th>coproc</th>
<th>CRm</th>
<th>opc1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b110</td>
<td>0b0011</td>
</tr>
</tbody>
</table>
```

if PSTATE.EL == EL0 then

G8.7.11  CNTHV_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the EL2 virtual timer.

**Configurations**

AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_TVAL_EL2[31:0].

This register is present only when AArch32 is supported and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

**Attributes**

CNTHV_TVAL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>TimerValue, bits [31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>The TimerValue view of the EL2 virtual timer.</td>
</tr>
<tr>
<td>On a read of this register:</td>
</tr>
<tr>
<td>• If CNTHV_CTL.ENABLE is 0, the value returned is UNKNOWN.</td>
</tr>
<tr>
<td>• If CNTHV_CTL.ENABLE is 1, the value returned is (CNTHV_CVAL - CNTVCT).</td>
</tr>
<tr>
<td>On a write of this register, CNTHV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.</td>
</tr>
<tr>
<td>When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHV_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.</td>
</tr>
<tr>
<td>When the timer condition is met:</td>
</tr>
<tr>
<td>• CNTHV_CTL.ISTATUS is set to 1.</td>

G8.7.12 CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

**Configurations**

AArch32 System register CNTHVS_CTL[31:0] are architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

**Attributes**

CNTHVS_CTL is a 32-bit register.

**Field descriptions**

![Field Descriptions Diagram]

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TV continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing CNTHVS_CTL

This register is accessed using the encoding for CNTV_CTL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

G8.7.13  CNTHVS_CVAL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

**Configurations**

AArch32 System register CNTHVS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHVS_CVAL_EL2[63:0].

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL are UNDEFINED.

**Attributes**

CNTHVS_CVAL is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Bit Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>CompareValue</td>
<td>63:0</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing CNTHVS_CVAL**

This register is accessed using the encoding for CNTV_CVAL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>

### G8.7.15 CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

#### Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

#### Configurations

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register CNTKCTL_EL1[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

#### Attributes

CNTKCTL is a 32-bit register.

#### Field descriptions

<table>

<td>EVNTEN</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Bits [31:18]

Reserved, RES0.

#### EVNTIS, bit [17]

*When FEAT_ECV is implemented:*

Controls the scale of the generation of the event stream.

0b0 The CNTKCTL.EVNTI field applies to CNTVCT[15:0].

0b1 The CNTKCTL.EVNTI field applies to CNTVCT[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [16:10]

Reserved, RES0.

#### PL0PTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

0b0 PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.
**PL0VTEN, bit [8]**

Traps PL0 accesses to the virtual timer registers to Undefined mode.

- **0b0**: PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to Undefined mode.
- **0b1**: This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTI, bits [7:4]**

Selects which bit of CNTVCT, as seen from EL1, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTVCT.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTVCT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the CNTVCT trigger bit, as seen from EL1 and defined by EVNTI, generates an event when the event stream is enabled.

- **0b0**: A 0 to 1 transition of the trigger bit triggers an event.
- **0b1**: A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from CNTVCT as seen from EL1.

- **0b0**: Disables the event stream.
- **0b1**: Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL0VCTEN, bit [1]**

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

- **0b0**: PL0 accesses to the CNTVCT are trapped to Undefined mode.
- **0b1**: PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0PCTEN is also 0.
- **0b1**: This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL0PCTEN, bit [0]**

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

- **0b0**: PL0 accesses to the CNTPCT are trapped to Undefined mode.
- **0b1**: PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0VCTEN is also 0.
- **0b1**: This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing CNTKCTL

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc}1>, <\text{R}t>, <\text{CRn}>, <\text{CRm}>\}, \{#<\text{opc}2>\}
\]

<table>
<thead>
<tr>

<td>0b000</td>
</tr>
</tbody>
</table>
G8.7.16 CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configurations**

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTP_CTL_EL0[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTP_CTL are UNDEFINED.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:3]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>ISTATUS, bit [2]</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
<tr>
<td>IMASK, bit [1]</td>
<td>Timer interrupt mask bit. Permitted values are:</td>
</tr>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
<tr>
<td>ENABLE, bit [0]</td>
<td>Enables the timer. Permitted values are:</td>
</tr>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>
Setting this bit to 0 disables the timer output signal, but the timer value accessible from \textbf{CNTP-TVAL} continues to count down.

\textbf{Note}
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:
- On a Warm reset, this field resets to $0$.

\textbf{Accessing CNTP_CTL}

Accesses to this register use the following encodings in the System register encoding space:

\begin{align*}
\text{MRC} \{<c>\} \{<q>\} & \quad <\text{coproc}>, \quad \{#\}<\text{opc1}>, \quad <\text{Rt}>, \quad <\text{CRn}>, \quad <\text{CRm}>, \quad \{#\}<\text{opc2}> \\
\begin{array}{cccccc}

G8.7.17  CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configurations

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTP_CVAL_EL0[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTP_CVAL are UNDEFINED.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

• CNTP_CTL.ISTATUS is set to 1.
• If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

\[

G8.7.18 **CNTP_TVAL, Counter-timer Physical Timer TimerValue register**

The CNTP_TVAL characteristics are:

**Purpose**
Holds the timer value for the EL1 physical timer.

**Configurations**
AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTP_TVAL_EL0[31:0].
This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTP_TVAL are UNDEFINED.

**Attributes**
CNTP_TVAL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td></td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.
On a read of this register:
- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CNTP_CVAL - CNTPCT).
On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.
When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.
When the timer condition is met:
- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.
When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.
The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTP_TVAL**

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRC}\{<c>\}{<q>} \coproc \{#<opc1>, <Rt>, <CRn>, <CRm>\{, (#)<opc2>\}
\]

**G8.7.19 CNTPCT, Counter-timer Physical Count register**

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configurations**

AArch32 System register CNTPCT bits [63:0] are architecturally mapped to AArch64 System register CNTPCT_EL0[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTPCT are UNDEFINED.

All reads to the CNTPCT occur in program order relative to reads to CNTPCTSS or CNTPCT.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

Bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTPCT**

Accesses to this register use the following encodings in the System register encoding space:

\[
\text{MRRC}(<c>){(q)} \ <\text{coproc}, \{#\}<opc1>, <Rt>, <Rt2>, <CRm>
\]

G8.7.20 CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configurations**

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTPCTSS_EL0[63:0].

This register is present only when AArch32 is supported and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are **UNDEFINED**.

All reads to the CNTPCTSS occur in program order relative to reads to CNTPCT or CNTPCTSS. This register is a self-synchronised view of the CNTPCT counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Self-Synchronized Physical count value</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Self-Synchronized Physical count value</td>
</tr>
</tbody>
</table>

Bits [63:0]

Self-Synchronized Physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing CNTPCTSS**

Accesses to this register use the following encodings in the System register encoding space:

\[
MRRC\{<c>\}{<q>} \langle coproc \rangle, \langle\#\langle opc1 \rangle, \langle Rt \rangle, \langle Rt2 \rangle, \langle CRm \rangle
\]

<table>

G8.7.21 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose
Control register for the virtual timer.

Configurations
AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

Attributes
CNTV_CTL is a 32-bit register.

Field descriptions

CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Configurations**

AArch32 System register CNTV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTV_CVAL_EL0[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTV_CVAL are UNDEFINED.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

![Field descriptions diagram]

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTV_CVAL**

Accesses to this register use the following encodings in the System register encoding space:

G8.7.23 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configurations**

AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTV_TVAL are UNDEFINED.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>TimerValue</th>
</tr>
</thead>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CNTV_CVAL - CNTVCT).

On a write of this register, CNTV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTV_TVAL**

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

G8.7.24 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF.

**Configurations**

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register CNTVCT_EL0[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of CNTPCT in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, HCR_EL2.{E2H, TGE} is \{1, 1\}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to CNTVCTSS or CNTVCT.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

![Virtual count value](image)

**Bits [63:0]**

Virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing CNTVCT**

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>
```

G8.7.25 CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT minus the virtual offset visible in CNTVOFF.

**Configurations**

AArch32 System register CNTVCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTVCTSS_EL0[63:0].

This register is present only when AArch32 is supported and FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS are UNDEFINED.

All reads to the CNTVCTSS occur in program order relative to reads to CNTVCT or CNTVCTSS. This register is a self-synchronised view of the CNTVCT counter, and cannot be read speculatively.

**Attributes**

CNTVCTSS is a 64-bit register.

G8.7.26 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

Configurations

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register CNTVOFF_EL2[63:0].

This register is present only when EL2 is capable of using AArch32. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

Note

When EL2 is implemented and is using AArch64, if HCR_EL2.{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when CNTVCT is read from Non-secure EL0.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

Accesses to this register use the following encodings in the System register encoding space:

\[

Part H
External Debug
Chapter H1
About External Debug

This chapter gives an overview of A-profile external debug and specifies the required debug authentication. It contains the following sections:

• *Introduction to external debug on page H1-10228.*
• *External debug on page H1-10229.*
• *Required debug authentication on page H1-10230.*

--- Note ---
For information about self-hosted debug, see Chapter D2 *AArch64 Self-hosted Debug* and Chapter G2 *AArch32 Self-hosted Debug.*
H1.1 Introduction to external debug

The A-profile supports both:

**Self-hosted debug**

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

**External debug**

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger that accesses the chip through a Debug Access Port.

External debug is particularly useful for:

- **Hardware bring-up.** That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- **PEs that are deeply embedded inside systems.**

To support external debug, the Arm architecture defines required features that are called *external debug features*.

**Note**

An external debugger has a potentially high level of control over and visibility into the PE. The system sets this level using debug authentication. See *Required debug authentication* on page H1-10230.

If the debug authentication level is set too low, agents may be able to bypass elements of the security and privilege models. This includes both off-chip agents and on-chip agents such as unprivileged or Non-secure software.

H1.1.1 Definition and constraints of a debugger in the context of external debug

When the description of external debug in this Part of the manual describes a *debugger* as controlling external debug this debugger might be a second on-chip PE or an off-chip device such as a JTAG debugger using a Debug Access Port (DAP).

If a Debug Access Port is implemented:

- When debug is prohibited at the Debug Access Port, the port must not generate accesses to the external debug interface of the PE.
- When Secure debug is prohibited at the Debug Access Port, the port must not generate Secure accesses to the external debug interface of the PE.
- When Secure accesses are allowed at the Debug Access Port, the port must be able to generate Secure accesses.

If `FEAT_Debugv8p4` is not implemented, accesses to the PE are controlled by the external authentication interface functions, `ExternalInvasiveDebugEnabled()`, `ExternalNoninvasiveDebugEnabled()`, `ExternalSecureNoninvasiveDebugEnabled()` and `ExternalSecureInvasiveDebugEnabled()`. The external authentication interface functions override MDCR_EL3.{EPMAD, EDAD}.

If `FEAT_TRF` is implemented, the bus Requester, which may be the Debug Access Port, controls the accesses it makes to the PE and MDCR_EL3.{EPMAD, EDAD} control Non-secure access to registers.

The Debug Access Port is not required to use the same authentication interface as the PE.

Arm recommends the following authentication interface:

- When `ExternalSecureInvasiveDebugEnabled()` == FALSE at the PE, Secure debug is disabled at the DAP.
- When `ExternalInvasiveDebugEnabled()` == FALSE at the PE, all debug is prohibited at the DAP.
H1.2 External debug

Debug events allow an external debugger to halt the PE. The A-profile provides the following debug events:

- **Halting Step debug events** on page H3-10276:
  - The debugger can use this resource to make the PE step through code one line at a time.

- **Halt Instruction debug event** on page H3-10286:
  - This might occur when software executes the Halting breakpoint instruction, HLT.

- **Exception Catch debug event** on page H3-10287:
  - This can be programmed to occur on all entries to a given Exception level.

- **External Debug Request debug event** on page H3-10291:
  - An embedded cross-trigger can signal this debug event.

- **OS Unlock Catch debug event** on page H3-10292:
  - This might occur when the state of the OS Lock changes from locked to unlocked.

- **Reset Catch debug events** on page H3-10293:
  - This might occur when the PE exits reset state.

- **Software Access debug event** on page H3-10294:
  - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Breakpoints and watchpoints can also halt the PE.

When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The Instruction Transfer Register, ITR, passes instructions to the PE to execute in Debug state:
  - The ITR contains a single register, EDITR, and associated flow-control flags.
- The Debug Communications Channel, DCC, passes data between the PE and the debugger:
  - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
  - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.
- The PE cannot service any interrupts in Debug state.

Chapter H2 Debug State describes Debug state in more detail.
H1.3 Required debug authentication

Any implementation must provide the debug authentication defined in this section, which controls:

- Whether the PE can halt.
- Whether some aspects of non-invasive debug are permitted.
- Some legacy aspects of the AArch32 self-hosted debug model.

The pseudocode functions shown in Table H1-1 on page H1-10230, and the conditions that follow that table, define the architectural requirements for debug authentication.

The following conditions always apply:

- If `ExternalInvasiveDebugEnabled()` is FALSE then `ExternalSecureInvasiveDebugEnabled()` is FALSE.
- If `ExternalNoninvasiveDebugEnabled()` is FALSE then `ExternalSecureNoninvasiveDebugEnabled()` is FALSE.
- If `ExternalInvasiveDebugEnabled()` is TRUE then `ExternalNoninvasiveDebugEnabled()` is TRUE.
- If `ExternalSecureInvasiveDebugEnabled()` is TRUE then `ExternalSecureNoninvasiveDebugEnabled()` is TRUE.

If FEAT_Debugv8p4 is implemented:

- `ExternalNoninvasiveDebugEnabled()` always returns TRUE.
- `ExternalSecureNoninvasiveDebugEnabled()` returns the same as `ExternalSecureInvasiveDebugEnabled()`.

Arm recommends the use of the interface described in Recommended authentication interface on page K6-11687 to provide this debug authentication. The pseudocode functions in Chapter J1 Armv8 Pseudocode, which are linked to by the entries in the Pseudocode function on page H1-10230 column of Table H1-1 on page H1-10230, assume that this interface is implemented.

### Table H1-1 Debug authentication functions

<table>
<thead>
<tr>
<th>Pseudocode function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ExternalSecureNoninvasiveDebugEnabled()</code></td>
<td>Returns TRUE if Secure non-invasive debug is enabled.</td>
</tr>
<tr>
<td><code>AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()</code></td>
<td>Returns TRUE if Secure invasive self-hosted debug is enabled in AArch32 state.</td>
</tr>
<tr>
<td><code>ExternalSecureInvasiveDebugEnabled()</code></td>
<td>Returns TRUE if Secure invasive debug is enabled.</td>
</tr>
<tr>
<td><code>ExternalNoninvasiveDebugEnabled()</code></td>
<td>Returns TRUE if Non-secure non-invasive debug is enabled.</td>
</tr>
<tr>
<td><code>ExternalInvasiveDebugEnabled()</code></td>
<td>Returns TRUE if Non-secure invasive debug is enabled.</td>
</tr>
</tbody>
</table>

The following conditions always apply:

- If `ExternalInvasiveDebugEnabled()` is FALSE then `ExternalSecureInvasiveDebugEnabled()` is FALSE.
- If `ExternalNoninvasiveDebugEnabled()` is FALSE then `ExternalSecureNoninvasiveDebugEnabled()` is FALSE.
- If `ExternalInvasiveDebugEnabled()` is TRUE then `ExternalNoninvasiveDebugEnabled()` is TRUE.
- If `ExternalSecureInvasiveDebugEnabled()` is TRUE then `ExternalSecureNoninvasiveDebugEnabled()` is TRUE.

If FEAT_Debugv8p4 is implemented:

- `ExternalNoninvasiveDebugEnabled()` always returns TRUE.
- `ExternalSecureNoninvasiveDebugEnabled()` returns the same as `ExternalSecureInvasiveDebugEnabled()`.
This chapter describes Debug state. It contains the following sections:

- About Debug state on page H2-10232.
- Halting the PE on debug events on page H2-10233.
- Entering Debug state on page H2-10239.
- Behavior in Debug state on page H2-10242.
- Exiting Debug state on page H2-10271.

**Note**

Table K17-1 on page K17-11836 disambiguates the general register references used in this chapter.
H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The Instruction Transfer Register, ITR, passes instructions to the PE to execute in Debug state.
- The Debug Communications Channel, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.
H2.2 Halting the PE on debug events

For details of debug events, see Introduction to Halting debug events on page H3-10274 and Breakpoint and Watchpoint debug events on page H2-10234.

On a debug event, the PE must do one of the following:
• Enter Debug state.
• Pend the debug event.
• Generate a debug exception.
• Ignore the debug event.

This behavior depends on both:
• Whether halting is allowed by the current state of the debug authentication interface. See Halting allowed and halting prohibited.
• The type of debug event and the programming of the debug control registers.
  — See Halting debug events for all Halting debug events.
  — See Breakpoint and Watchpoint debug events on page H2-10234 for Breakpoint and Watchpoint debug events.

See also Other debug exceptions on page H2-10234.

This means that behavior can be CONSTRAINED UNPREDICTABLE if the conditions change. See Synchronization and Halting debug events on page H3-10295.

Summary of debug events and possible outcomes on page H3-10274 summarizes the possible outcomes of each type of debug event.

H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:
• Halting is always prohibited in Debug state.
• Halting is always prohibited when DoubleLockStatus() == TRUE.
  — This means that FEAT_DoubleLock is implemented and OS Double lock is locked.
• Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
  — The PE is in Non-secure state and ExternalInvasiveDebugEnabled() == FALSE.
  — The PE is in Secure state and ExternalSecureInvasiveDebugEnabled() == FALSE.

——— Note ————
See Appendix K6 Recommended External Debug Interface for more information on these functions.

• Otherwise, halting is allowed.

For more information, see:
• Pseudocode description of Halting on debug events on page H2-10238
• Required debug authentication on page H1-10230.

H2.2.2 Halting debug events

The Halting debug events are described in Chapter H3 Halting Debug Events.

When a Halting debug event is generated, it causes entry to Debug state if all of the following are true:
• Halting is allowed. See Halting allowed and halting prohibited.
• The Halting debug event is one of:
  — A Halt Instruction debug event and EDSRCR.HDE == 1.
  — A Software Access debug event and OSLSR_EL1.OSLK == 0, meaning that the OS Lock is unlocked.
  — Neither a Halt Instruction debug event nor a Software Access debug event.
Note

— A Halt Instruction debug event is the only Halting debug event that relies on \texttt{EDSCR.HDE == 1}.
— Halting on Breakpoint and Watchpoint debug events is also controlled by \texttt{EDSCR.HDE}. See \textit{Breakpoint and Watchpoint debug events}.
— \texttt{EDSCR.HDE} can be written by software when the OS Lock is locked. Privileged code can use \texttt{MDCR_EL3.TDOSA} and \texttt{HDCR.TDOSA} to trap writes to these registers.

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

• If the Halting debug event is a Halt Instruction debug event, the instruction that generated the Halting debug event is treated as \texttt{UNDEFINED}.
• If the Halting debug event is a Software Access debug event, it is ignored.
• If the Halting debug event is an Exception Catch debug event, it is ignored except when \texttt{FEAT_Debugv8p8} is implemented, in which case the event might be pended.

In all other cases the Halting debug event is pended, see \textit{Pending Halting debug events on page H3-10295}.

\textit{Summary of actions from debug events on page H2-10237} summarizes the possible outcome for each type of Debug event.

Note

Halting debug events never generate debug exceptions.

H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

• Halting debug is enabled, that is \texttt{EDSCR.HDE == 1}.
• Halting is allowed. See \textit{Halting allowed and halting prohibited on page H2-10233}.
• The OS Lock is unlocked, that is \texttt{OSLSR.OSLK == 0}.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

\texttt{MDSCR_EL1.MDE} or \texttt{DBGDSCRExt.MDBGen} is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

• Generates a Breakpoint or Watchpoint exception.
• Is ignored.

Note

\texttt{EDSCR.HDE} is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

See Chapter D2 \textit{AArch64 Self-hosted Debug}, Chapter G2 \textit{AArch32 Self-hosted Debug}, and the Note in \textit{Other debug exceptions}.

H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

• Breakpoint Instruction exceptions.
• Software Step exceptions.
• Vector Catch exceptions.
The behavior of these events is unchanged when Halting debug mode is enabled, that is when EDSCR.HDE == 1. This means that these events can do one of the following:

• They can generate a debug exception.
• They can be ignored.

For additional information, see Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.

## H2.2.5 Debug state entry and debug event prioritization

The following are synchronous debug events:

• Breakpoint debug event.
• Watchpoint debug event.
• Halting Step debug event.
• Halt Instruction debug event.
• Exception Catch debug event.
• Software Access debug event.
• Reset Catch debug event.

Each of these synchronous debug events are treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, if halting is allowed, the synchronous debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

Note

• Reset Catch and Exception Catch debug events might be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the reset or asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.

• The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events these are taken first.

If halting is prohibited then Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously. OS Unlock Catch debug events are always pended and taken asynchronously. See Pending Halting debug events on page H3-10295.

The architecture does not define when asynchronous debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED. See Synchronization and Halting debug events on page H3-10295.

The following list shows how the synchronous debug events are prioritized, with 1 being the highest priority.

Note

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in Synchronous exception types on page D1-4646, and in particular Prioritization of interrupts on page D1-4664. This numbering correlates with the equivalent AArch32 list in Exception prioritization for exceptions taken to AArch32 state on page G1-8932.

The priority for synchronous debug events is as follows:

1

Reset Catch debug event. See Reset Catch debug events on page H3-10293.

This debug event has a higher priority than the synchronous exceptions listed in Synchronous exception types on page D1-4646.

2

Exception Catch debug event. See Exception Catch debug event on page H3-10287.

This debug event can be assigned one of two priorities. When it has a priority of 2, it has a higher priority than the synchronous exceptions listed in the Exception model.

3

Halting Step debug event. See Halting Step debug events on page H3-10276.
This debug event has a higher priority than the synchronous exceptions listed in the Exception model.

4 This event is not a debug event.
5 Exception Catch debug event. See Exception Catch debug event on page H3-10287.
   This debug event can be assigned one of two priorities, 0 or 5.
6-7 These events are not debug events.
8 Breakpoint exception or debug event or Address Matching Vector Catch exception. See Breakpoint exceptions on page D2-4707, and Vector Catch exceptions on page G2-9093.
   These two debug events have the same priority.
9 This event is not a debug event.
10 Halt Instruction debug event. See Halt Instruction debug event on page H3-10286.
11-26 These events are not debug events.
27 Software Access debug event. See Software Access debug event on page H3-10294.
28-31 These events are not debug events.
32 Watchpoint exception or debug event. See Watchpoint exceptions on page D2-4726 for exceptions taken from AArch64 state, or Watchpoint exceptions on page G2-9079 for exceptions taken from AArch32 state.
33 This event is not a debug event.

For Reset Catch debug events and Halting Step debug events, the priorities listed in this section apply only when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

For more information on the prioritization of exceptions, see:
- Synchronous exception types on page D1-4646.
- Prioritization of interrupts on page D1-4664.
- Exception prioritization for exceptions taken to AArch32 state on page G1-8932. This section covers synchronous and asynchronous exceptions.

**Breakpoint debug events and Vector Catch exception**

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See Prioritization of Synchronous exceptions taken to AArch64 state on page D1-4650.

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONstrained UNpredictable choice of:
- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This applies only if all of the following are true:
- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

**H2.2.6 Imprecise entry to Debug state**

Debug state entry is normally precise. This means that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state. See Definition of a precise exception and imprecise exception on page D1-4638.

A debugger can write a value of 1 to EDRCR.CBRRQ to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is OPTIONAL and it is IMPLEMENTATION DEFINED when it is effective at forcing entry to Debug state.
The PE ignores writes to this bit if either:
- External debugging is not enabled, meaning `ExternalInvasiveDebugEnabled()` == FALSE.
- Secure external debugging is not enabled, meaning `ExternalSecureInvasiveDebugEnabled()` == FALSE, and either:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented.

**Example H2-1** shows how entry to Debug state can be forced.

---

**Example H2-1 Forcing entry to Debug state**

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to `EDCR.CBRRQ`. The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have CONSTRAINED UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

---

**H2.2.7 Summary of actions from debug events**

**Table H2-1 on page H2-10238** shows the Software and Halting debug events. In **Table H2-1 on page H2-10238**, the columns have the following meaning:

**Debug event type**

This means the type of debug event where:

- **Other software**
  - Means one of:
    - *Software Step exceptions* on page D2-4742.
    - *Breakpoint Instruction exceptions* on page D2-4705.
    - *Vector Catch exceptions* on page D2-4741 for AArch64 state or *Vector Catch exceptions* on page G2-9093 for AArch32 state.

- **Other Halting**
  - Means one of the following:
    - *Halting Step debug events* on page H3-10276.
    - *External Debug Request debug event* on page H3-10291.
    - *Reset Catch debug events* on page H3-10293.
    - *OS Unlock Catch debug event* on page H3-10292.

Other debug events are referred to explicitly.

**Authentication**

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

- **In Secure state** `ExternalInvasiveDebugEnabled()`.
- **In Non-secure state** `ExternalSecureInvasiveDebugEnabled()`.

**DLK**

This indicates whether `FEAT_DoubleLock` is implemented and locked, `DoubleLockStatus()` == TRUE.

**OSLK**

This is the value of `OSLSR.OSLK`. It indicates whether the OS Lock is locked.

**HDE**

This is the value of `EDSCR.HDE`. It indicates whether Halting debug is enabled.
The letter X in Table H2-1 on page H2-10238 indicates that the value can be either 0 or 1.

### H2.2.8 Pseudocode description of Halting on debug events

The `Halted()`, `Restarting()`, `HaltingAllowed()`, and `HaltOnBreakpointOrWatchpoint()` functions are described in the pseudocode.
H2.3 Entering Debug state

On entry to Debug state, the preferred restart address and PSTATE are saved in DLR and DSPSR. The PE remains in the mode and security state from which it entered Debug state.

If EDRCR.CBRRQ has a value of 0, entry to Debug state is precise. If EDRCR.CBRRQ has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in EDWAR.

For more information, see:

- Determining the memory location that caused a Watchpoint exception on page D2-4734 for a debug event taken from AArch64 state.
- Determining the memory location that caused a Watchpoint exception on page G2-9086 for a debug event taken from AArch32 state.

Other than the effect on PSTATE and EDSCR, entry to Debug state is not a Context synchronization event. The effects of entry to Debug state on PSTATE and EDSCR are synchronized.

H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of PSTATE.T before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from EDSCR.RW, and the current Exception level can be read from EDSCR.EL.

The current endianness state, PSTATE.E, is unchanged on entry to Debug state.

Note

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by SCTLR.EE.
- If EL2 is using AArch32 state, the current endianness state can differ from that indicated by HSCTLR.EE.
- On entry to Debug state from AArch32 state, PSTATE.SS is copied to DSPSR.SS, even though the PE remains in AArch32 state.

See also Effect of entering Debug state on PSTATE on page H2-10240.

H2.3.2 Effect of Debug state entry on DLR and DSPSR

DLR is set to the preferred restart address for the debug event, which depends on the event type. The value of PSTATE is saved in DSPSR.

For entry to Debug state from AArch32 state, the values saved in DSPSR.IT are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event. It is CONstrained UNPREDICTable whether DSPSR_EL0.BTYPE is set to the value of PSTATE.BTYPE or 0 for synchronous debug events other than the following debug events:

- A Halting Step debug event.
- A Breakpoint debug event.
- A Halt Instruction debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.
• For Halt Instruction debug events, DLR is set to the address of the HLT instruction and DSPSR.IT is correct for the HLT instruction.
• For Software Access debug events, DLR is set to the address of the accessing instruction and DSPSR.IT is correct for this instruction.
• For Halting Step debug events taken synchronously, DLR and DSPSR are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and PSTATE for, the instruction after the one that was stepped.
• For Exception Catch debug events, DLR is set to the address of the first instruction that must be executed on exit from Debug state, and DSPSR is correct for this instruction. This is the exception vector or reset vector address.
  — If the debug event is generated on taking an exception to a trapped Exception level, the DLR is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the VBAR for the Exception level has never been initialized. The DSPSR records the value of PSTATE after taking the exception. The Exception Catch occurs after the SPSR and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.
  — If the debug event is generated on an exception return to a trapped Exception level, the DLR is set to the target address of the exception return and the DSPSR records the value of PSTATE after the exception return.
• Reset Catch debug events taken synchronously behave like Exception Catch debug events.
• For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the DLR is set to the address of the last instruction that must be executed on exit from Debug state and the DSPSR records the reset value of PSTATE.
• For pending Halting debug events and External Debug Request debug events, DLR is set to the address of the first instruction that must be executed on exit from Debug state and DSPSR.IT is correct for this instruction. See Pending Halting debug events on page H3-10295.

Normally DLR is aligned according to the instruction set state indicated in DSPSR. However, a debug event might be taken at a point where the PC is not aligned.

**H2.3.3 Effect of Debug state entry on System registers, the Event register, and Exclusives monitors**

Entering Debug state has no effect on System registers other than DLR and DSPSR. In particular, ESRs, FARs, and FSRs are not updated on entering Debug state. SCR is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors.

— Entry to Debug state might set the Event Register or clear the Exclusives monitors, or both. However, this is not a requirement, and debuggers must not rely on any implementation specific behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and Exclusives monitors.

**H2.3.4 Effect of entering Debug state on PSTATE**

The effect of an entry to Debug state on PSTATE is described in Entering Debug state on page H2-10239 and Entering Debug state from AArch32 state on page H2-10239.

On entry to Debug state after PSTATE is saved in DSPSR:
• PSTATE.IL is cleared to 0.
• PSTATE.TCO is set to 1.
• PSTATE.BTYPE is set to 0.
• PSTATE.{IT, T, SS, D, A, I, F, SSBS, ALLINT} are set to UNKNOWN values
PSTATE.\{N, Z, C, V, GE, E, M, nRW, EL, SP, PAN, UAO, DIT\} are unchanged.

For more information, see PSTATE in Debug state on page H2-10242.

H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with DSPSR.SS set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with DSPSR.SS set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with DSPSR.SS set to 0. This is because PSTATE.SS is set to 0 by taking the exception.
- If the PE is reset, PSTATE.SS is reset to 0. If the following debug events are enabled, and halting is allowed, the PE enters Debug state with DSPSR.SS set to 0:
  - Reset Catch debug event at the reset Exception level.
  - Exception Catch debug event at the reset Exception level.
  - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and DSPSR.SS is set to 0.

H2.3.7 Pseudocode description of entering Debug state

The DebugHalt constants are described in shared/debug/halting/DebugHalt on page J1-11369 in the pseudocode. The UpdateEDSCRFields() and Halt() functions are described in Chapter J1 Armv8 Pseudocode.
**H2.4 Behavior in Debug state**

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, EDITR. The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch64 state it executes A64 instructions.
- If the PE is in AArch32 state it executes T32 instructions:
  - For a 32-bit T32 instruction, EDITR[15:0] specifies the first halfword and EDITR[31:16] specifies the second halfword.
  - For a 16-bit T32 instruction, EDITR[15:0] contains the instruction and EDITR[31:16] is ignored. All 16-bit T32 instructions are UNPREDICTABLE in Debug state.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See *Debug state operations, DCPS, DRPS, MRS, MSR on page H2-10262*. In Non-debug state these instructions are UNDEFINED.

The following sections describe behavior in Debug state:

- **PSTATE in Debug state**
- **Executing instructions in Debug state** on page H2-10243.
- **Decode tables** on page H2-10256.
- **Security in Debug state** on page H2-10261.
- **Privilege in Debug state** on page H2-10262.
- **Debug state operations, DCPS, DRPS, MRS, MSR** on page H2-10262.
- **Exceptions in Debug state** on page H2-10265.
- **Accessing registers in Debug state** on page H2-10267.
- **Accessing memory in Debug state** on page H2-10270.

This section specifies the CONSTRAINED UNPREDICTABLE behaviors that apply in Debug state, but see *Changing the value of EDECR.SS when not in Debug state on page H3-10283* for a change in Non-debug state that causes CONSTRAINED UNPREDICTABLE behavior.

**H2.4.1 PSTATE in Debug state**

**PSTATE**. {N, Z, C, V, IT, GE, SS, ALLINT, SSBS, BTYPE, D, A, I, F, T} are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE executes only T32 instructions and **PSTATE.IT** is ignored.
- Software step is inactive.
- Asynchronous exceptions and debug events are ignored.
- If **FEAT_SSBS** is implemented, then hardware is permitted to load or store speculatively, regardless of the value of **PSTATE.SSBS**.
- In AArch64 state, **PSTATE.BTYPE** is treated as 0b00.

Instructions executed in Debug state indirectly read **PSTATE**. {TCO, UAO, PAN, IL, E, M, nRW, EL, SP} as they would in Non-debug state.

[Note] **PSTATE.DIT** is not guaranteed to have any effect in Debug state.

In Debug state:

- **PSTATE.PAN** is set to 1 by:
  - A **DCPS** instruction to EL1 using AArch64 if **SCTLR_EL1.SPAN == 0**.
  - A **DCPS** instruction to EL2 using AArch64 if **SCTLR_EL2.SPAN == 0**.
- **PSTATE.UAO** is set to 0 by a **DCPS** instruction to AArch64 state.
- **PSTATE.TCO** is set to 1 by a **DCPS** instruction to AArch64 state.
**PSTATE** can also be changed by taking exceptions in Debug state, and by the execution of **DCPS** and **DRPS** instructions.

When **FEAT_MTE** is implemented, if Memory-access mode is enabled and **PSTATE.TCO** is 0, reads and writes to the external debug interface DTR registers are **CONSTRAINED UNPREDICTABLE**, with the following permitted behaviors:

- The PE behaves as if **PSTATE.TCO** is 0. That is, the load or store operation performs the tag check if required.
- The PE behaves as if **PSTATE.TCO** is 1. That is, the load or store operation does not perform the tag check.

For more information, see Chapter D9 The Memory Tagging Extension.

**H2.4.2 Executing instructions in Debug state**

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- **Debug state instructions.** These are instructions that are changed in Debug state. See *A64 instructions that are changed in Debug state* and *T32 instructions that are changed in Debug state* on page H2-10251.
- **Instructions that are unchanged in Debug state.** See *A64 instructions that are unchanged in Debug state* on page H2-10244 and *T32 instructions that are unchanged in Debug state* on page H2-10252.
- **Instructions that are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.** See *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-10247 and *T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-10254.

All T32 instructions are treated as unconditional, regardless of **PSTATE.IT**. See *PSTATE in Debug state* on page H2-10242.

If **EDSCR.SDD** == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See *Security in Debug state* on page H2-10261.

**Executing A64 instructions in Debug state**

The following sections describe the behavior of the A64 instructions in Debug state:

- *A64 instructions that are changed in Debug state.*
- *A64 instructions that are unchanged in Debug state* on page H2-10244.
- *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-10247.

**A64 instructions that are changed in Debug state**

The following A64 instructions are defined in Debug state, but are **UNDEFINED** in Non-debug state:

- **DCPS.**
  
  Note
  
  DCPS can be **UNDEFINED** in certain conditions in Debug state. See *DCPS<n>* on page H2-10262.

- **DRPS.**
- **MRS (DLR_EL0), MRS (DSPSR_EL0), MSR (DLR_EL0), MSR (DSPSR_EL0)**
- **When FEAT_SVE is implemented, CMPNE (immediate) with byte element size.**

  Note

  In Debug state, CMPNE (immediate) with byte element size sets **DLR_EL0** and **DSPSR_EL0** to **UNKNOWN** values. However, the instruction is unchanged with respect to the SVE vector and SVE predicate source and destination registers.

  For more information, see *Debug state operations, DCPS, DRPS, MRS, MSR* on page H2-10262.
A64 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state:

Any instruction that is undefined in Non-debug state

This list of instructions excludes:

- Any instruction listed in A64 instructions that are changed in Debug state on page H2-10243.
- Any instruction listed in A64 instructions that are constrained unpredictable in Debug state on page H2-10247 that is undefined because an enable or disable bit is not RES0 or RES1.

Instructions that move System or Special-purpose registers to or from a general-purpose register

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes PSTATE access instructions.

These instructions are:

- MRS <special_reg>, MSR <special_reg>.

Note

This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, CurrentEL, PAN, UAO, DIT, and TCO.

- MRS <system_reg>, MSR <system_reg>.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- FMOV (between a general-purpose register and a half-precision register).
- FMOV (between a general-purpose register and a single-precision register).
- FMOV (between a general-purpose register and a double-precision register).
- FMOV (between a general-purpose register and a SIMD element).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- INS (from a general-purpose register to a SIMD element).
- UMOV (from a SIMD element to a general-purpose register).

SVE instructions

When FEAT_SVE is implemented, these instructions are:

- CPY.
- DUP (scalar).
- EXT.
- INSR (scalar).
- PTRUE with ALL constraint and byte element size.
- RDFFR (unpredicated).
- RDVL.
- WRFFR.

Barriers

These instructions are:

- DMB.
- DSB.
- ISB.
- CSDB.
- SSBB.
- PSSBB.
• When FEAT_SB is implemented, SB.
• When FEAT_SPE is implemented, PSB CSYNC.
• When FEAT_TRBE is implemented, TSB CSYNC.
• When FEAT_RAS is implemented, ESB.

Memory access instructions at various access sizes

The following constraints apply:
• General purpose-registers only.
• One of the following addressing modes:
  — Unscaled (9-bit signed) immediate offset.
  — Immediate (9-bit signed) post-indexed.
  — Immediate (9-bit signed) pre-indexed.
  — Unprivileged (9-bit signed).
• Not literal.
• One of the following types:
  — (Single) register.
  — Exclusive.
  — Exclusive pair.
  — Acquire/Release.
  — Acquire/Release Exclusive.
  — Acquire/Release Exclusive pair.
• 32-bit and 64-bit target register variants.

These instructions are:
• LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW (immediate, not literal).
• LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW (immediate).
• LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW (immediate).
• LDAR, LDARB, LDARH, LDXRB, LDXRH, LDAXR, LDAXRB, LDAXRH.
• LDXP, LDAXP.
• STR, STRB, STRH (immediate).
• STUR, STURB, STURH (immediate).
• STTR, STTRB, STTRH (immediate).
• STL, STLAR, STLARH, STXR, STXRB, STXRH, STLXR, STLXRB, STLXRH.
• STLX, STLXRB.
• When FEAT_LOR is implemented:
  — LDLAR, LDLARB, LDLARH.
  — STLLR, STLLRB, STLLRH.
• When FEAT_LSE is implemented:
  — CAS, CASB, CASH, CASP.
  — SWP, SWPB, SWPH.
  — LDADD, LDADDB, LDADDB.
  — LDCLR, LDCLB, LDCLRH.
  — LDEOR, LDEORB, LDEORH.
  — LDSET, LDSETB, LDSETBH.
  — LDSMAX, LDSMAXB, LDSMAXH.
  — LDSMIN, LDSMINB, LDSMINH.
  — LDUMAX, LDUMAXB, LDUMAXH.
  — LDUMIN, LDUMINB, LDUMINH.
  — STADD, STADDB, STADDH.
  — STCLR, STCLB, STCLRH.
  — STEOR, STEORB, STEORH.
  — STSET, STSETB, STSETH.
Move immediate to general-purpose register

These instructions are:
- MOVZ, MOVN, MOVK (immediate).
- MOV (between a general-purpose register and the stack pointer).

System instructions, Send Event, NOP, Clear Exclusive, and Prediction

In this context, the System instructions are the Cache maintenance instructions, TLB maintenance instructions, Address translation instructions, and the prediction restriction instructions.

These instructions are:
- IC.
- DC.
- TLBI.
- AT.
- SEV, SEVL.
- NOP.
- CLRdX.
- CFP.
- CPP.
- DVP.

Basic pointer authentication instructions

When FEAT_PAuth is implemented, these instructions are:
- AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIAZ.
- AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIBZ.
- AUTDA, AUTDAZ.
- AUTDB, AUTDBZ.
- PACIA, PACIA1716, PACIASP, PACIAZ, PACIZ.
- PACIB, PACIB1716, PACIBSP, PACIBZ, PACIBZ.
- PACDA, PACDAZ.
- PACDB, PACDBZ.
- PACCA.
- XPACD, XPA I, XPA CRI.

Memory Tagging Extension instructions

These instructions are:
- When FEAT_MTE is implemented:
  - ADDG.
  - SUBG.
H2.4 Behavior in Debug state

A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state

This subsection describes all instructions that are not listed in either:

- A64 instructions that are changed in Debug state on page H2-10243.
- A64 instructions that are unchanged in Debug state on page H2-10244.

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR_EL0 and DSPSR_EL0 to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is COMP.

Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- BRK.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCP51.
- HVC behaves as DCP52.
- SMC behaves as DCP53.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in Exceptions in Debug state on page H2-10265.
Note

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSR.SDD is set to 1.

Instructions that explicitly write to the PC (branches)

These instructions are:
• B, B.cond, BL, BLR, BR, CBZ, CBNZ, RET, TBZ, TBNZ.
• When FEAT_HBC is implemented, BC.cond.

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They execute as in Non-debug state without branching and set DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

Exception return and related instructions

This instruction is:
• ERET.

This instruction behaves in one of the following ways:
• It is UNDEFINED.
• It executes as a NOP.
• It executes as in Non-debug state without branching. It sets DSPSR_EL0 and DLR_EL0 to UNKNOWN values, and either:
  — Executes the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
  — Does not change the Exception level.

Instructions that request entry to a low-power state

These instructions are:
• WFE, WFI.
• When FEAT_WFxT is implemented, WFET, WFIT.

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See Configurable instruction controls on page D1-4665.
• A WFE instruction clears the Event register if it is set.

Note

This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:
• LDR (literal), LDRSW (literal).
• ADR, ADRP.
• PRFM (literal).

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They execute as in Non-debug state, using an UNKNOWN value for the PC operand.
Instructions that explicitly modify `PSTATE`, other than `DCPS` and `DRPS`:

These instructions are:

- ADDS, SUBS, ADCS, SBCS, ANDS, BICS, COMN, COMP.
- FCMPL, FCMPU, FCMPO, FCMPOE.
- MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSel (immediate).
- MSR N2CV (register), MSR DAIF (register), MSR SPSel (register).
- When `FEAT_PAN` is implemented:
  - MSR PAN (immediate).
  - MSR PAN (register).
- When `FEAT_UAO` is implemented:
  - MSR UAO (immediate).
  - MSR UAO (register).
- When `FEAT_FlagM` is implemented:
  - CFINV.
  - RMIF.
  - SETF8.
  - SETF16.
- When `FEAT_DIT` is implemented, MSR DIT.
- When `FEAT_FlagM2` is implemented:
  - AXFLAG.
  - XAFLAG.
- When `FEAT_MTE` is implemented, MSR TC0.
- When `FEAT_RNG` is implemented:
  - MRS RNDR.
  - MRS RNDRS.
- When `FEAT_NMI` is implemented:
  - MSR ALLINT (immediate).
  - MSR ALLINT (register).
- When `FEAT_MOPS` is implemented:
  - CPYFP, CPYFPN, CPYFPR, CPYFPRTN, CPYFPRTRN, CPYFPT, CPYFPTN, CPYFPTR, CPYFPTRW, CPYFPTWN, CPYFPWPWTN, CPYFPWTRN, CPYFPWTRWN.
  - CPYP, CPYPN, CPYPRT, CPYPRTRN, CPYPRTRWN, CPYPRPT, CPYPRPTN, CPYPRTR, CPYPRTRN, CPYPRTRWN, CPYPRWT, CPYPRWTN.
  - SETP, SETPN, SETPT, SETPTN.
  - SETGP, SETGPN, SETGPT, SETGPTN.
- When `FEAT_SVE` is implemented:
  - ANDS
  - BICS
  - BRKAS
  - BRK8S
  - BRK8N
  - BRKPAS
  - BRKPBS
  - CMPEQ
  - CMPEGE
  - CMPEG
  - CMPI
  - CMPIE
  - CMPL0
  - CMPLS
H2.4 Behavior in Debug state

- CMPLT
- CMPNE
- CTERMEQ
- CTERMNE
- EORS
- MATCH
- NANDS
- NMATCH
- NORS
- ORNS
- ORRS
- PFIRST
- PNEXT
- PTEST
- PROES
- RDFFRS
- WHILEGE
- WHILEGT
- WHILEHI
- WHILEHS
- WHILELE
- WHILELO
- WHILELS
- WHILELT
- WHILERW
- WHILERW

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:
- CSEL, CSINC, CSINV, CSNEG, CONN, COMP, FCSER, FCOMP, FCOMPE.
- ADC, ADCS, SBC, SBCS.
- MRS NZCV, MRS DAIF, MRS SPSel, MRS CurrentEl.
- When FEAT_PAN is implemented, MRS PAN.
- When FEAT_UAO is implemented, MRS UAO.
- When FEAT_FlagM is implemented, CFINV.
- When FEAT_FlagM2 is implemented, AXFLAG, XAFLAG.
- When FEAT_DIT is implemented, MRS DIT.
- When FEAT_MTE is implemented, MRS TCO.
- When FEAT_NMI is implemented, MRS ALLINT.
- When FEAT_MOPS is implemented:
  - CPYFM, CPYFMN, CPYFMRN, CPYFMRT, CPYFMRTN, CPYFMMR, CPYFMMRN, CPYFMMRT, CPYFMMRTN, CPYFMMRN, CPYFMMRT.
  - CPYFEN, CPYFRN, CPYFERT, CPYFERTRN, CPYFERTWN, CPYFET, CPYFETN, CPYFETR, CPYFETRN, CPYFETWN, CPYFETFR, CPYFETRW, CPYFETW, CPYFETRN, CPYFETWN.
  - CPYM, CPYMN, CPYMRT, CPYMRTN, CPYMRTWN, CPYMRT, CPYMRTN, CPYMRTWN, CPYMRT, CPYMRTN, CPYMRTWN, CPYMRT, CPYMRTN, CPYMRTWN, CPYMRT, CPYMRTN, CPYMRTWN, CPYMRT, CPYMRTN, CPYMRTWN, CPYMRT, CPYMRTN, CPYMRTWN.
When FEAT_SVE is implemented, all SVE instructions that use a predicate.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as aNOP.
- They execute as in Non-debug state:
  - For the conditional operations and those that use Condition flags as an input, these instructions use UNKNOWN values for the Condition flag.
  - For the MRS instruction, they return an UNKNOWN value.

Hint instructions

When FEAT_DGH is implemented, this instruction is:

- DGH.

This instruction behaves in one of the following ways:

- It executes as aNOP.
- It executes as in Non-debug state.

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as aNOP.
- They execute as in Non-debug state.

--- Note ---

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.

Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- T32 instructions that are changed in Debug state.
- T32 instructions that are unchanged in Debug state on page H2-10252.
- T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-10254.

T32 instructions that are changed in Debug state

The following T32 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- DCPS.

--- Note ---

DCPS can be UNDEFINED in certain conditions in Debug state. See DCPS<n> on page H2-10262.

- MRC p15,3,<Rt>,c4,c5,0 (DSPSR).
- MCR p15,3,<Rt>,c4,c5,0 (DSPSR).
- MRC p15,3,<Rt>,c4,c5,1 (DLR).
- MCR p15,3,<Rt>,c4,c5,1 (DLR).

In addition, ERET executes the DRPS operation in Debug state.
For more information, see Debug state operations, DCPS, DRPS, MRS, MSR on page H2-10262.

**T32 instructions that are unchanged in Debug state**

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR.\{N, Z, C, V\} as the source or destination register is not included in the list. Moreover, the list includes only the 32-bit T32 encodings.

**Any instruction that is undefined in Non-debug state**

The list of instructions:

- Excludes any instruction listed in T32 instructions that are changed in Debug state on page H2-10251.
- Excludes any instruction listed in T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-10254 that is undefined because an enable or disable bit is not RES0 or RES1.

**Instructions that move System or Special-purpose registers to or from a general-purpose register**

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- \textsf{MRS <banked_reg>, MSR <banked_reg>}.  

\textbf{Note}

This does not apply to cases which are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state in the current mode.

- \textsf{MRC, MCR}.

\textbf{Note}

This includes all allocated System registers in the (\textsf{coproc}==0b111x) encoding space other than an \textsf{MRC} move to APSR\_nzcv.

- \textsf{MRS SPSR, MSR SPSR\_{fsxc} (register)}.  

- \textsf{VMRS <vfp\_system\_reg>, VMSR <vfp\_system\_reg>}.  

\textbf{Note}

This includes all allocated Advanced SIMD and floating-point System registers, other than an \textsf{VMRS} move to APSR\_nzcv.

**Floating-point moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- \textsf{VMOV (between a general-purpose register and a single-precision register)}.  

- \textsf{VMOV (between a general-purpose register and a doubleword floating-point register)}.  

**SIMD moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- \textsf{VMOV (between a general-purpose register and a scalar)}.  

**Barriers**

These instructions are:

- \textsf{CSDB}.  

- \textsf{DMB}.  

- \textsf{DSB}.  

- \textsf{ISB}.  

Memory access instructions at various access sizes

The following constraints apply:

- General purpose registers only.
- One of the following addressing modes:
  - Immediate (8-bit or 12-bit) offset.
  - Immediate (8-bit) post-indexed.
  - Immediate (8-bit) pre-indexed.
  - Unprivileged (8-bit).
- Not literal.
- One of the following types:
  - (Single) register.
  - Dual.
  - Exclusive.
  - Exclusive doubleword.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive doubleword.

These instructions are:

- LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT (immediate).
- LDREX, LDREXB, LDRH, LDAB, LDAH, LDEX, LDAEXB, LDAEXH.
- LDREXD, LDAEXD.
- STR.W, STRB.W, STRH.W, STRD (immediate).
- STRT, STRBT, STRHT (immediate).
- STREX, STREXB, STREXH, STL, STLH, STLEX, STLEXB, STLEXH.
- STREXD, STLEXD.

Move to general-purpose register

These instructions are:

- MOVW, MOVT (immediate).

System instructions, Send Event, NOP, and Clear Exclusive

The System instructions are Cache maintenance instructions, TLB maintenance instructions, and Address translation instructions. These are encoded in the (coproc == 0b1111) System register encoding space.

These instructions are:

- ICIALLU, ICIALLUIS, ICIMVAU.
- DCCIMVAC, DCCISW, DCCMVAC, DCCMVAU, DCCSW, DCMVAC, DCISW.
- TLBIAL, TLBIALLH, TLBIALLHIS, TLBIALLIS, TLBIALLNNSNI, TLBIALLNNSNH, TLBIALNSHIS, TLBIALSID, TLBIALSIDS, TLBIALPAS2, TLBIALPAS2IS, TLBIALPAS2L, TLBIALPAS2LIS, TLBIMV, TLBIMVAAI, TLBIMVAAIS, TLBIMVAAL, TLBIMVAALIS, TLBIMVAH, TLBIMVAHIS, TLBIMVAIS, TLBIMVAL, TLBIMVALH, TLBIMVALHIS, TLBIMVALIS.
- ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, ATS12NSOUW, ATS1CPR, ATS1CPUW, ATS1HR, ATS1HW.
- BPIALL, BPIALLIS, BPIMVA.
- SEV.W, SEVL.W.
**T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state**

This subsection describes all instruction not listed in either:
- **T32 instructions that are changed in Debug state** on page H2-10251.
- **T32 instructions that are unchanged in Debug state** on page H2-10252.

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:
- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR and DSPSR to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

**Exception-generating instructions**

These instructions are:
- SVC.
- HVC.
- SMC.
- UDF.
- BKPT.
- HLT.

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCP51.
- HVC behaves as DCP52.
- SMC behaves as DCP53.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in **Exceptions in Debug state** on page H2-10265.

**Note**

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSR.SDD is set to 1.

**Instructions that explicitly write to the PC (branches)**

These instructions are:
- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TB8, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set DSPSR and DLR to UNKNOWN values.
Exception return and related instructions, other than ERET

These instructions are:
- SRS, RFE, SUBS pc, lr, and related instructions.

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching, setting DLR and DSPSR to UNKNOWN values, and either:
  - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
  - Not changing Exception level or PE mode.

Instructions that request entry to a low-power state

These instructions are:
- WFE, WFI, WFET, WFIT

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See Configurable instruction enables and disables, and trap controls on page G1-9001.
- A WFE instruction is permitted to clear the Event register if it is set.

--- Note ---
This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:
- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

Instructions that explicitly modify PSTATE, other than DCPS and ERET

These instructions are:
- CMP, TST, TEQ, CMN.
- <op>=5.
- MRC p14,0,APSR_nzcv,c0,c1,0 (accessing DBGDSCRint).
- CPS, SETEND, IT.
- MSR CPSR (immediate), MSR CPSR (register), MSR APSR (immediate), MSR APSR (register).
- VMRS APSR_nzcv, FPSCR.
- QADD, QADD, QSUB, QSUB.
- SMLABB, SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMLAD.
- SSAT, SSAT16, USAT, USAT16.
- SADD, SADD, SADD, SASX, SSAX, SSUB, SSUB, SSUB8, SSUB16.
- UADD, UADD, UADD, USAX, USAUB, USUN8, USUB16.
- When FEAT_PAN is implemented, SETPAN.
These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

**Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields**

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the Condition flag.
  - For the MRS instruction, they return an UNKNOWN value.

**All other instructions**

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

--- **Note** ---

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are CONSTRAINED UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register.

**Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors** describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
  - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
  - Might set DLR and DSPSR to UNKNOWN values.
  - Might have any of the other permitted behaviors.

- Instructions that specify R15 as a source operand:
  - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
  - Might have any of the other permitted behaviors, including using an UNKNOWN value.

---

**H2.4.3 Decode tables**

The syntax in the tables is defined as follows:

- **1** The bit has a fixed value of 1.
- **0** The bit has a fixed value of 0.
- **!**\(=\) The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.
Note

The instruction encodings in Chapter C6 A64 Base Instruction Descriptions and Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or UNDEFINED, in which case the instruction is UNDEFINED or CONSTRAINED UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:
• Chapter C6 A64 Base Instruction Descriptions.
• Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions.

For information about the syntax used in Table H2-2, Table H2-3, Table H2-4 on page H2-10257, and Table H2-5 on page H2-10259, see:
• Common syntax terms on page C1-228.
• Assembler symbols on page F1-7225.

Table H2-2 shows the A64 instructions that are modified in Debug state. For details of how these are packed in the EDITR, see the register description.

<table>

H2.4.4 Security in Debug state

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure debug disabled flag, EDSCR.SDD.

On entry to Debug state

If entering in Secure state, EDSCR.SDD is set to 0. Otherwise EDSCR.SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled(). That is:

- If ExternalSecureInvasiveDebugEnabled() == TRUE, EDSCR.SDD is set to 0.
- If ExternalSecureInvasiveDebugEnabled() == FALSE, EDSCR.SDD is set to 1.

Note

Normally, if ExternalSecureInvasiveDebugEnabled() == FALSE then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a Context synchronization event to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

In Debug state

The value of EDSCR.SDD does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

Note

- DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID} are not frozen in Debug state.
- If EDSCR.SDD set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.

In Non-debug state

EDSCR.SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a Context synchronization event is required to guarantee their effect.

Note

- In Non-debug state, EDSCR.SDD is unaffected by the Security state of the PE.
- A Context synchronization event is also required to guarantee that changes in the authentication signals are visible in DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID}.

If EL3 is not implemented and the implemented Security state is Non-Secure state, EDSCR.SDD is RES1.
H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

• The privilege to execute *Debug state operations, DCPS, DRPS, MRS, MSR.*
• The privilege to execute DTR access instructions regardless of the Exception level and traps.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be undefined or trapped in Non-debug state. These instruction are:

• The *MRS* and *MSR* instructions that access DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0 in AArch64 state.
• The *MRC* and *MCR* instructions that access DBGDTRTXint and DBGDTRRXint in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and undefined instructions, and includes generating exceptions when the System registers trap or disable an instruction.

H2.4.6 Debug state operations, DCPS, DRPS, MRS, MSR

The architecture defines operations to change between Exception levels in Debug state. These operations can also change the mode at the current Exception level.

**DCPS<\text{n}>**

Executing a *DCPS<\text{n}>* instruction in Debug state moves the PE to a higher Exception level or to a specific mode at the current Exception level.

If the *DCPS<\text{n}>* instruction is executed in AArch32 state and the target Exception level is using AArch64:

• The current instruction set switches from T32 to A64.
• The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See *Execution state* on page D1-4632.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

• In AArch64 state the current endianness is determined by the value of SCTLR_ELx.EE for the target Exception level.
• In AArch32 state the current endianness is determined by the value of SCTLR.EE or HSCTLR.EE for the target Exception level.

The *DCPS<\text{n}>* instructions are:

**In AArch64 state**

• DCPS1
• DCPS2
• DCPS3

**In AArch32 state, in the T32 instruction set only**

• DCPS1
• DCPS2
• DCPS3

The DCPS instructions are undefined in Non-debug state.

Table H2-6 on page H2-10263 shows the target of the instruction. In Table H2-6 on page H2-10263, the entries have the following meaning:

**EL1h/Svc**  
This means that the target is:

• EL1h if EL1 is using AArch64.
H2.4 Behavior in Debug state

- EL1 and Supervisor mode if EL1 is using AArch32.

EL2h/Hyp

This means that the target is:
- EL2h if EL2 is using AArch64.
- EL2 and Hyp mode if EL2 is using AArch32.

EL3h/Monitor

This means that the target is:
- EL3h if EL3 is using AArch64.
- EL3 and Monitor mode if EL3 is using AArch32.

Svc

Secure Supervisor mode, in EL3 using AArch32.

Monitor

Secure Monitor mode, in EL3 using AArch32.

Table H2-6 Target for DCPS instructions in Debug state

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Target when DCPS instruction executed at stated Exception level:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EL0</td>
</tr>
<tr>
<td>DCPS1</td>
<td>EL1h/Svc</td>
</tr>
<tr>
<td>DCPS2</td>
<td>EL2h/Hyp</td>
</tr>
<tr>
<td>DCPS3</td>
<td>EL3h/Monitor</td>
</tr>
</tbody>
</table>

In AArch32 Monitor mode, DCPS1 and DCPS3 clear SCR.NS to 0.

Note

In AArch64 state, at EL3, DCPS<n> does not change SCR_EL3.NS.

However:
- **DCPS1** is **UNDEFINED** at EL0 if either:
  - EL2 is implemented and enabled in the current Security state, and is using AArch64 and HCR_EL2.TGE == 1.
  - In Non-secure state, EL2 is implemented and using AArch32 and HCR.TGE == 1.
- **DCPS2** is **UNDEFINED** at all Exception levels if EL2 is not implemented.
- **DCPS2** is **UNDEFINED** at the following Exception levels if EL2 is implemented:
  - At EL0 and EL1 in Secure state if EL2 is disabled in the current Security state.
  - At EL3 if EL3 is using AArch32.
- **DCPS3** is **UNDEFINED** at all Exception levels if either:
  - EDSR.SDD == 1.
  - EL3 is not implemented.

Note

The references to DCPS1, DCPS2, and DCPS3 in this section link to the descriptions of the instructions in the A64 instruction set. The DCPS<n> instructions are also defined in the T32 instruction set, see DCPS1, DCPS2, DCPS3. These instructions are not defined in the A32 instruction set, because A32 instructions cannot be executed in Debug state.

On executing a DCPS instruction:
- If the target Exception level is using AArch64:
  - ELR_ELx of the target Exception level becomes UNKNOWN.
  - SPSR_ELx of the target Exception level becomes UNKNOWN.
  - ESR_ELx of the target Exception level becomes UNKNOWN.
Debug State
H2.4 Behavior in Debug state

— DLR_EL0 and DSPSR_EL0 become UNKNOWN.

• If the target Exception level is using AArch32 DLR and DSPSR become UNKNOWN and:
  — If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.
  — If the target Exception level is EL2, then ELR_hyp, SPSR_hyp, and HSR become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of
the target mode become UNKNOWN.

If FEAT_SSBS is implemented, the DCPS<-> instruction leaves the PSTATE.SSBS bit UNKNOWN.

The DCPSInstruction() function is described in Chapter J1 Armv8 Pseudocode.

DRPS

Executing the DRPS operation in Debug state moves the PE to a lower Exception level, or to another PE mode at
the current Exception level, by copying the current SPSR to PSTATE.

If DRPS is executed in AArch64 state and the target Exception level is using AArch32:
• The current instruction set switches from A64 to T32.
• The effect on registers that are not visible or only partially visible in AArch32 state is the same as for
  exception returns in Non-debug state. See Execution state on page D1-4632.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level.
However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:
• If targeting an Exception level using AArch64, current endianness is set according to SCTLR_ELx.EE, or
  SCTLR_EL1.E0E for the target Exception level.
• If targeting an Exception level using AArch32, current endianness is set by SPSR.E as appropriate.

The DRPS instructions are:
In AArch64 state

• DRPS

In AArch32 state, in the T32 instruction set only

• ERET

If the SPSR specifies an illegal exception return, then PSTATE.{M, nRW, EL, SP} are unchanged and PSTATE.IL
is set to 1. For further information on illegal exception returns, see Illegal exception returns from AArch64 state
on page D1-4645.

PSTATE.{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are ignored in Debug state. This means that the effect of the DRPS
operation on these fields is to set them to an UNKNOWN value that might be the value from the SPSR. For more
information, see PSTATE in Debug state on page H2-10242.

All other PSTATE fields are copied from SPSR.

DRPS is UNDEFINED at EL0 and in Non-debug state.

Note

Unlike an exception return, the DRPS operation has no architecturally-defined effect on the Event Register and
Exclusives monitors. DRPS might set the Event Register or clear the Exclusives monitors, or both, but this is not a
requirement and debuggers must not rely on any implementation specific behavior.

On executing a DRPS instruction:
• If the target Exception level is using AArch64:
  — DLR_EL0 and DSPSR_EL0 become UNKNOWN.
• If the target Exception level is using AArch32:
  — DLR and DSPSR become UNKNOWN.
If FEAT_SSBS is implemented, the DRPS instruction leaves the PSTATE.SSBS bit UNKNOWN.

The DRPSInstruction() function is described in Chapter J1 Armv8 Pseudocode.

**MRS and MSR**

The other Debug state instructions are used to read or write DLR_EL0 and DSPSR_EL0.

These instructions are:

**In AArch64 state**
- MRS
- MSR (register)

**In AArch32 state**
- MRC
- MCR

MRS <Xt>, DLR_EL0 ; Copy DLR_EL0 to <Xt>
MRS <Xt>, DSPSR_EL0 ; Copy DSPSR_EL0 to <Xt>
MSR DLR_EL0, <Xt> ; Copy <Xt> to DLR_EL0
MSR DSPSR_EL0, <Xt> ; Copy <Xt> to DSPSR_EL0

These instructions can be executed at any Exception level when in Debug state, including EL0. They are UNDEFINED in Non-debug state.

**H2.4.7 Exceptions in Debug state**

The following sections describe how exceptions are handled in Debug state:

- *Generating exceptions when in Debug state.*
- *Taking exceptions when in Debug state* on page H2-10266.
- *Reset in Debug state on page H2-10267.*

### Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
  - The pending interrupt remains visible in ISR.
- Debug exceptions and debug events are ignored.
- SCR.EA is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.
- Any attempt to execute an instruction bit pattern that is an allocated instruction at the current Exception level, but is listed in *Executing instructions in Debug state on page H2-10243* as UNDEFINED in Debug state, generates an exception.

________ Note __________

If the exception is taken to an Exception level that is using AArch32 then it is taken as an Undefined Instruction exception.

The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.

- Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:
  - When the value of EDSCR.SDD is 0, generate the appropriate trap exception that is taken to EL3.
  - When the value of EDSCR.SDD is 1, are treated as UNDEFINED and generate an exception.

If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, then it is reported with an EC value of 0x00.
Otherwise, synchronous exceptions are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

Note

If EDSCR.SDD == 1 then an exception from Non-secure state is never taken to Secure state. See Security in Debug state on page H2-10261.

Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

• The target Exception level is as defined for the exception in Non-debug state.
• If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.
• The exception syndrome is reported as defined for the exception in Non-debug state, except for the case described in Data Aborts in Memory access mode on page H4-10304 for which the reporting requirements are relaxed.

The exception syndrome is reported using the syndrome register or registers for the target Exception level. In AArch64 state, these are ESR_ELx, and FAR_ELx. In AArch32 state, these are DFSR, DFAR, HSR, HDFAR, and HPFAR. For example:

— If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the DFSR reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, DFSR is not updated.
— If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as AFSR, is IMPLEMENTATION DEFINED.

Note

Generally, the AArch32 Fault Address Registers (FARs) and Fault Status Registers (FSRs) are not described as syndrome registers, although the term is appropriate to their function.

• The PE remains in Debug state and changes to the target mode.
• If EL3 is using AArch32 and the exception is taken from Monitor mode, SCR.NS is cleared to 0.
• If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the System register for the target Exception level.
• The endianness switches to that indicated by the EE bit of the System register for the target Exception level.
• The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
• If the target Exception level is EL2 using AArch32, ELR_hyp becomes unknown.
• If the target Exception level is EL1 or EL3 using AArch32, LR_<mode> for the target mode becomes unknown.
• DLR and DSPSR become UNKNOWN.
• The cumulative error flag, EDSCR.ERR, is set to 1. See Cumulative error flag on page H4-10308.
• PSTATE.IL is cleared to 0.
• PSTATE.{IT, T, SS, D, A, I, F, ALLINT} are set to UNKNOWN values, and PSTATE.{N, Z, C, V, Q, GE} are unchanged. However, these fields are ignored and are not observable in Debug state. For more information, see PSTATE in Debug state on page H2-10242.

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.
Pseudocode description of taking exceptions in Debug state

The pseudocode function `AArch64.TakeException()` shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function `AArch64.TakeExceptionInDebugState()`.

The pseudocode functions `AArch32.EnterMode()`, `AArch32.EnterHypMode()`, and `AArch32.EnterMonitorMode()` show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state:

- `AArch32.EnterMode()` is replaced with the function `AArch32.EnterModeInDebugState()`.
- `AArch32.EnterHypMode()` is replaced with the function `AArch32.EnterHypModeInDebugState()`.
- `AArch32.EnterMonitorMode()` is replaced with `AArch32.EnterMonitorModeInDebugState()`.

Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, `EDSCR.STATUS == 0b000010` and writes to `EDITR` are ignored.

Note

If `EDECR.RCE == 1` or `CTIDEVCTL.RCE == 1`, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See Reset Catch debug events on page H3-10293. All PE registers have taken their reset values, which might be UNKNOWN.

H2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

General-purpose register access, other than AArch64 state SP access

A single general-purpose register can be read by issuing an MSR instruction through the ITR to write `DBGDTR_EL0` in AArch64 state, or an MCR instruction through the ITR to write `DBGDTRXTint` in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

Figure H2-1 on page H2-10268 shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.
Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state

Figure H2-2 on page H2-10269 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.
### SIMD and floating-point register, System register, and AArch64 state SP accesses

To read a SIMD and floating-point register or a System register, the debugger must first copy the value into a general-purpose register using:

- An FMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for floating-point transfers to SIMD and FP registers.
- A UMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for SIMD transfers to SIMD and FP registers.
- An MSR instruction in AArch64 state or an MRC instruction in AArch32 state for System registers.
- A MOV Xd, SP instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

### PC and PSTATE access

The debugger reads the program counter and PSTATE of the process being debugged through the DLR_EL0 and DSPSR_EL0 System registers. The actual values of PC and PSTATE cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and PSTATE in Non-debug state are undefined in Debug state.
- On taking an exception, ELR_ELx and SPSR_ELx at the target Exception level are unknown. They do not record the PC and PSTATE.

PSTATE {TCO, UAO, PAN, IL, E, M, nRW, EL, SP} are indirectly read by instructions executed in Debug state, but all other PSTATE fields are ignored and cannot be observed. See also:

- **PSTATE in Debug state on page H2-10242.**
- **Executing instructions in Debug state on page H2-10243.**
- **Exceptions in Debug state on page H2-10265.**
H2.4.9   Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. Executing instructions in Debug state on page H2-10243 lists the memory access instructions that are supported in Debug state.

Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See DCC and ITR access modes on page H4-10302.
H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If EDSCR.ITE == 0 the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

--- Note ---

- Implementations can set EDSCR.ITE to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and EDSCR.ITE == 1, then the PE must complete these instructions in Debug state before executing the restart sequence. EDSCR.ITE == 0 indicates that the PE is not ready to restart.

- A debugger must observe that any instructions issued through EDITR that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the EDSCR.{TXfull, RXfull} flags.

On exiting Debug state, the PE sets the program counter to the address in DLR, where:

- If exiting to AArch32 state:
  - Bits[31:1] of the PC are set to the value of bits[31:1] of DLR.
  - Bit[0] of the PC is set to a CONSTRAINED UNPREDICTABLE choice of 0 or the value of bit[0] in DLR.
- If exiting to AArch64 state:
  - Bits[63:56] of DLR_EL0 might be ignored as part of tagged address handling. See Address tagging on page D8-5162.
  - Otherwise the PC is set from DLR_EL0.

--- Note ---

Bits[63:32] of DLR_EL0 are ignored when exiting to AArch32 state.

Exit from Debug state can give rise to a PC alignment fault exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see PC alignment checking on page D1-4668.

On exiting Debug state, PSTATE is set from DSPSR in the same way that an exception return sets PSTATE from SPSR_ELx:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on PSTATE and the PC is the same as for any other illegal exception return. See Exception return on page D1-4644 and Exception return to an Exception level using AArch32 on page G1-8951.

- The checks on the PSTATE.IT bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

- PSTATE.SS is copied from DSPSR.SS if all of the following hold:
  - MDSCR_EL1.SS == 1.
  - The debug target Exception level is using AArch64.
  - Software step exceptions from the restart Exception level are enabled. Otherwise PSTATE.SS is set to 0.

--- Note ---

Unlike a return using ERET, PSTATE.SS must be restored from DSPSR.SS because otherwise it is UNKNOWN.
However, if OSDLR.DLK == 1 and DBGPRCR.CORENPDRQ == 0, meaning FEAT_DoubleLock is implemented and locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether PSTATE.SS is copied from DSPSR.SS.

- If FEAT_SBS is implemented, on exit from Debug state to AArch64 state, DSPSR_EL0.SSBS is copied to PSTATE.SSBS.
- If FEAT_SBS is implemented, on exit from Debug state to AArch32 state, DSPSR.SSBS is copied to CPSR.SSBS.
- If FEAT_PAN is implemented, DSPSR_EL0.PAN is copied to PSTATE.PAN.
- If FEAT_UAO is implemented, DSPSR_EL0.UAO is copied to PSTATE.UAO.
- If FEAT_DIT is implemented, on exit from Debug state to AArch64 state, DSPSR_EL0.DIT is copied to PSTATE.DIT.
- If FEAT_DIT is implemented, on exit from Debug state to AArch32 state, DSPSR.DIT is copied to CPSR.DIT.
- If FEAT_MTE is implemented, on exit from Debug state to AArch64 state, DSPSR_EL0.TCO is copied to PSTATE.TCO. On exit from Debug state to AArch32 state, PSTATE.TCO is not updated.
- If FEAT_BTI is implemented, DSPSR_EL0.BTYPE is copied to PSTATE.BTYPE.
- If FEAT_NMI is implemented, DSPSR_EL0.ALLINT is copied to PSTATE.ALLINT.

--- Note ---

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example, PSTATE.{D, A, I, F} is updated regardless of the value of SCTLR_EL1.UMA.

- Exit from Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors. An exit from Debug state might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

---

The ExitDebugState() function is described in Chapter J1 Armv8 Pseudocode.
Chapter H3
Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

• Introduction to Halting debug events on page H3-10274.
• Halting Step debug events on page H3-10276.
• Halt Instruction debug event on page H3-10286.
• Exception Catch debug event on page H3-10287.
• External Debug Request debug event on page H3-10291.
• OS Unlock Catch debug event on page H3-10292.
• Reset Catch debug events on page H3-10293.
• Software Access debug event on page H3-10294.
• Synchronization and Halting debug events on page H3-10295.

——— Note ————
Table K17-1 on page K17-11836 disambiguates the general register references used in this chapter.
H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available from the introduction of Armv8:

- Halting Step debug events on page H3-10276.
- Halt Instruction debug event on page H3-10286.
- Exception Catch debug event on page H3-10287.
- External Debug Request debug event on page H3-10291.
- OS Unlock Catch debug event on page H3-10292.
- Reset Catch debug events on page H3-10293.
- Software Access debug event on page H3-10294.

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See Breakpoint and Watchpoint debug events on page H2-10234. Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see Chapter H2 Debug State. For a definition of halting allowed, see Halting allowed and halting prohibited on page H2-10233.

Debug state entry and debug event prioritization on page H2-10235 describes the behavior when multiple debug events are generated by an instruction.

See also Synchronization and Halting debug events on page H3-10295.

Table H3-1 on page H3-10274 shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

H3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- Overview of a Halting Step debug event.
- The Halting Step state machine.
- Using Halting Step on page H3-10279.
- Detailed Halting Step state machine behavior on page H3-10279.
- Synchronization and the Halting Step state machine on page H3-10282.
- Stepping T32 IT instructions on page H3-10283.
- Disabling interrupts while stepping on page H3-10284.
- Syndrome information on Halting Step on page H3-10284.
- Pseudocode description of Halting Step debug events on page H3-10285.

The architecture describes the behavior as a simple Halting Step state machine. See The Halting Step state machine.

H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in Figure H3-1 on page H3-10278. A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, EDECR.SS and EDESR.SS.

--- Note ---

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

H3.2.2 The Halting Step state machine

The state machine states are:

**Inactive**

Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:

- Halting Step is disabled. That is, EDECR.SS is set to 0 and EDESR.SS is set to 0.
- Halting is prohibited. See Halting the PE on debug events on page H2-10233. In this state, if EDECR.SS is set to 1, then a Halting Step debug event is pending.

In Figure H3-1 on page H3-10278, this state is shown in red.

**Active-not-pending**

Halting Step is enabled and active. This is the state in which the PE steps an instruction. EDECR.SS == 1 and EDESR.SS == 0. Software must not set EDECR.SS to 1 unless the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE, as described in Changing the value of EDECR.SS when not in Debug state on page H3-10283.

In Figure H3-1 on page H3-10278, this state is shown in green.
Active-pending

Halting Step is enabled and active. The step has completed and the PE enters Debug state.

EDESR.SS == 1.

In Figure H3-1 on page H3-10278, this state is shown in green.

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on EDESR.SS. Halting Step state machine states on page H3-10279 shows this.

In the simple sequential execution of the program, the PE executes the Halting Step state machine as follows:
1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

Figure H3-1 on page H3-10278 shows a Halting Step state machine.
Halting Debug Events

H3.2 Halting Step debug events

Figure H3-1 Halting Step state machine

a. Step completed occurs when:
   • A debug event, other than a Halting Step debug event, causes entry into Debug state.

b. Step completed occurs when:
   • An instruction is executed without taking an exception.
   • An exception is taken to a state where halting is allowed.
   • A reset.

c. Step completed occurs when:
   • An SMC exception is taken to Secure state where halting is prohibited.

d. An asynchronous exception taken to a state where halting is allowed.

e. An asynchronous exception taken to Secure state where halting is prohibited.
Note

Figure H3-1 on page H3-10278 describes only state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as EDECR and OSDLR and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior. See Synchronization and the Halting Step state machine on page H3-10282.

The following bits control the state machine, as shown in Table H3-3:

- EDECR.SS. This is the Halting Step enable bit.
- EDESR.SS. This is the Halting Step debug event pending bit.

Table H3-3 shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

H3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:
1. The debugger sets EDECR.SS to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with DLR set to the address of the instruction being stepped. The PE clears EDESR.SS to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped. If an exception is taken to a state where halting is prohibited, then EDESR.SS is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

Note

- If FEAT_DoPD is not implemented, EDECR.SS value is in the Debug power domain, meaning that the state machine is maintained over a powerdown of the Core power domain.
- If FEAT_DoPD is implemented, the values of EDECR.SS and EDESR.SS are set to 0 on a Cold reset, and, if the PE was stepping an instruction, EDESR.SS is effectively UNKNOWN after a Warm reset. A debugger must use a Reset Catch debug event to step over a powerdown state.
- A debugger must only change the value of EDECR.SS when the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE as described in Changing the value of EDECR.SS when not in Debug state on page H3-10283.

H3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- Entering the active-not-pending state on page H3-10280.
- PE behavior in the active-not-pending state on page H3-10280.
- Entering the active-pending state on page H3-10281.
Halting Debug Events

H3.2 Halting Step debug events

- **PE behavior in the active-pending state on page H3-10281.**
- **PE behavior in the inactive state when in Non-debug state on page H3-10282.**
- **PE behavior in Debug state on page H3-10282.**

### Entering the active-not-pending state

The PE enters the active-not-pending state:
- By exiting Debug state to a state where halting is allowed with $EDECR.SS == 1$.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with $EDECR.SS == 1$ and $EDESR.SS == 0$.
- As described in *Synchronization and the Halting Step state machine on page H3-10282.*

### PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:
- It executes one instruction and does one of the following:
  - Completes it without taking a synchronous exception.
  - Takes a synchronous exception generated by the instruction.
  - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without executing any instruction.
- It takes an asynchronous debug event into Debug state.

**If no exception or debug event is generated**

If no exception or debug event is generated the PE sets $EDESR.SS$ to 1. This means that the Halting Step state machine advances to the active-pending state.

**If an exception or debug event is generated**

The PE sets $EDESR.SS$ according to all of the following:
- The type of exception.
- The target Exception level of the exception.
- If the exception is taken to Secure state, whether halting is prohibited in Secure state.
  - This is determined by the result of $ExternalSecureInvasiveDebugEnabled()$.

If an exception or debug event is generated, the PE sets $EDESR.SS$ to 1 if one of the following applies:
- A synchronous exception is generated by the instruction and one of the following applies:
  - The exception is taken to EL1 or EL2.
  - The exception is taken to EL3, it is not an SMC exception, and $ExternalSecureInvasiveDebugEnabled() \equiv TRUE$.
  - The exception is an SMC exception.
- An asynchronous exception is generated before executing an instruction and this is either:
  - Taken to EL1 or EL2.
  - Taken to EL3 and $ExternalSecureInvasiveDebugEnabled() \equiv TRUE$.
- A PE reset occurs.

Otherwise, $EDESR.SS$ is unchanged. This happens when:
- No instruction is executed because either:
  - An asynchronous exception is taken to EL3 and $ExternalSecureInvasiveDebugEnabled() \equiv FALSE$.
  - An asynchronous debug event causes entry to Debug state.
- An instruction is executed and either:
  - Generates a synchronous exception other than an SMC exception which is taken to EL3, and $ExternalSecureInvasiveDebugEnabled() \equiv FALSE$.
  - Generates a synchronous debug event and causes entry to Debug state.
It is **UNPREDICTABLE** whether `EDESR.SS` is set to 1 or unchanged when an SError interrupt is taken to EL3 without executing the instruction, and `ExternalSecureInvasiveDebugEnabled()` == FALSE.

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise, the Halting Step state machine advances to the active-pending state.

**Note**

The underlying criteria for the value of `EDESR.SS` on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

Table H3-4 on page H3-10281 shows the behavior of the active-not-pending state. The letter X indicates that `ExternalSecureInvasiveDebugEnabled()` can be either TRUE or FALSE.

<table>

**Entering the active-pending state**

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
  - Executing an instruction without taking an exception.
  - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when `EDESR.SS` == 1.

**Note**

That is, an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled()` == FALSE to Non-secure state with `ExternalInvasiveDebugEnabled()` == TRUE.

- A reset when the value of `EDECR.SS` == 1, regardless of the state the PE was in before the reset occurred.
- From the active-pending state by taking an asynchronous exception to a state where halting is allowed.
- Following the description in *Synchronization and the Halting Step state machine on page H3-10282.*

**PE behavior in the active-pending state**

When the PE is in the active-pending state, it enters Debug state before executing an instruction.
The entry into Debug state has higher priority than all other types of synchronous debug event and synchronous exception. However, the architecture does not define the prioritization of this Debug state entry with respect to any unmasked pending asynchronous exception. If an asynchronous exception is prioritized over the entry to Debug state, then EDESR.SS is unchanged.

For more information on the prioritization of debug events, see Debug state entry and debug event prioritization on page H2-10235.

**PE behavior in the inactive state when in Non-debug state**

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which in some situations is a Context synchronization event.

See also Synchronization and the Halting Step state machine.

**PE behavior in Debug state**

Halting Step is inactive in Debug state because halting is prohibited, see Halting allowed and halting prohibited on page H2-10233.

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS == 1, Halting Step enters the active-not-pending state.

--- Note ---

This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in PE behavior in the active-not-pending state on page H3-10280, because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

---

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS == 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

**H3.2.5 Synchronization and the Halting Step state machine**

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
  - The Security state changes without an exception return. See State and mode changes without explicit context synchronization events on page G2-9100.
  - The external authentication interface changes.
  - FEAT_DoubleLock is implemented and the status, DoubleLockStatus(), changes.
- A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.

--- Note ---

Behavior is CONSTRAINED UNPREDICTABLE if the value of EDECR.SS is changed when the PE is in Non-debug state, see Changing the value of EDECR.SS when not in Debug state on page H3-10283.

---

- A write to EDESR when the PE is in Non-debug state clears EDESR.SS to 0.

These operations are guaranteed to take effect only after a Context synchronization event. If the instruction being stepped generates a Context synchronization event, then the PE might use the old or new state.
The PE must perform the required behavior of the new state before or immediately following the next \textit{Context synchronization event}, but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next \textit{Context synchronization event}. This is illustrated in Example H3-1 and Example H3-2.

\textbf{Example H3-1 Synchronization requirements 1}

\texttt{EDECR.SS} is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. \texttt{ExternalSecureInvasiveDebugEnabled()} == FALSE, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. \texttt{EDESR.SS} remains set to 0. If \texttt{ExternalSecureInvasiveDebugEnabled()} subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next \textit{Context synchronization event}, but it is not required to do so immediately.

\textbf{Example H3-2 Synchronization requirements 2}

\texttt{EDECR.SS} is set to 1 in Debug state. On exit from Debug the PE executes an \texttt{MSR} instruction that sets \texttt{OSDLR_EL1.DLK} to 1 and \texttt{DoubleLockStatus()} becomes TRUE. This change requires a \textit{Context synchronization event} to guarantee its effect, meaning it is \textbf{CONSTRAINED UNPREDICTABLE} whether:

\begin{itemize}
  \item Halting is allowed:
    \begin{itemize}
      \item The PE enters Debug state on the next instruction.
    \end{itemize}
  \item Halting is prohibited:
    \begin{itemize}
      \item The PE does not enter Debug state.
    \end{itemize}
\end{itemize}

The value in \texttt{EDESR.SS} depends on whether halting was allowed or prohibited when the write to \texttt{OSDLR_EL1.DLK} completed, and so it might be 0 or 1. If a second \texttt{MSR} instruction clears \texttt{OSDLR_EL1.DLK} to 0, the PE must perform the required behavior of the state indicated by \texttt{EDESR.SS} before or immediately following the next \textit{Context synchronization event}, but it is not following the behavior to do so immediately.

See also \textit{Synchronization and Halting debug events} on page H3-10295.

\textbf{Changing the value of EDECR.SS when not in Debug state}

If software changes the value of \texttt{EDECR.SS} when the PE is not in Debug state then behavior is \textbf{CONSTRAINED UNPREDICTABLE}, and one or more of the following behaviors occurs:

\begin{itemize}
  \item The value of \texttt{EDECR.SS} becomes \texttt{UNKNOWN}.
  \item The state of the Halting Step state machine becomes \texttt{UNKNOWN}.
  \item On a reset of the PE, the value of \texttt{EDECR.SS} and the state of the Halting Step state machine are \texttt{UNKNOWN}.
\end{itemize}

\textbf{H3.2.6 Stepping T32 IT instructions}

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is \textbf{IMPLEMENTATION DEFINED} whether:

\begin{itemize}
  \item The PE considers such a pair of instructions to be one instruction.
  \item The PE considers such a pair of instructions be two instructions.
\end{itemize}

It is \textbf{IMPLEMENTATION DEFINED} whether this behavior depends on the value of the applicable ITD bit. For example:

\begin{itemize}
  \item The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.
\end{itemize}
• The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
• The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

**HSCTLR.ITD**  
Applies to execution at EL2 when EL2 is using AArch32.

**SCTLR.ITD**  
Applies to execution at EL0 or EL1 when EL1 is using AArch32.

**SCTLR_EL1.ITD**  
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

**H3.2.7 Disabling interrupts while stepping**

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting EDSCR.INTdis, to allow the code being debugged to make forward progress.

**H3.2.8 Syndrome information on Halting Step**

Three EDSCR.STATUS encodings record different scenarios for entering Debug state on a Halting Step debug event:

**Halting Step, normal**  
An instruction other than a Load-Exclusive instruction was stepped.

**Halting Step, exclusive**  
A Load-Exclusive instruction was stepped.

**Halting Step, no syndrome**  
The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, EDSCR.STATUS is set to either:

• Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
• Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

If the stepped instruction was a conditional Load-Exclusive instruction that failed its Condition code check, EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise, the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, EDSCR.STATUS is set to Halting Step, no syndrome. This happens when:

• The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
• The active-pending state is entered for other reasons. See Synchronization and the Halting Step state machine on page H3-10282.

In addition, EDSCR.STATUS is CONSTRAINED UNPREDICTABLE when:

• A different exception is taken before the Halting Step debug event.
In this case `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of:

- Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

- The instruction that was stepped was an Exception Return instruction or an ISB. As these instructions are not in the Load-Exclusive instructions, `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
- The PE enters directly into the active-pending state on a Warm reset because `EDECR.SS` is set to 1. `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.

In all cases, if `EDSCR.STATUS` is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting `EDSCR.STATUS` to Halting Step, normal or Halting Step, exclusive.

--- Note ---

If the PE cannot determine whether the stepped instruction was a Load-Exclusive instruction or not, then it sets `EDSCR.STATUS` to Halting Step, no syndrome. For example, the exception is taken before the PE decodes the stepped instruction, or the exception means the PE has no valid stepped instruction to decode.

--- Note ---

In an implementation that always sets `EDSCR.STATUS` to Halting Step, no syndrome is not compliant.

### H3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `RunHaltingStep()`. This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if `EDECR.RCE == 1` or `CTIDEVCTL.RCE == 1`. `RunHaltingStep()` affects the next instruction.
- `CheckHaltingStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.
H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when EDSCR.HDE == 1, halting is allowed, and the PE executes the Halt instruction, HLT.

The pseudocode for Halt Instruction debug events is described in HLT on page C6-1506 for A64 and HLT on page F5-7574 for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if EDSCR.HDE == 0, or if halting is prohibited.

A debugger can replace a program instruction with a Halt instruction to generate a Halt Instruction debug event. Debuggers that use the HLT instruction must be aware of the rules for concurrent modification of executable code, CMODX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See Concurrent modification and execution of instructions on page B2-156.

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as undefined. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the Condition code field is not 0b1110, with the set of behaviors the same as for BKPT. See Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

The HLT instruction is part of the external debug solution from the introduction of Armv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 System register ID_ISAR0. Debug does not indicate the presence of the HLT instruction.

H3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 HLT instruction cannot be combined with an IT instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

• If the value of the ITD field is 1, then the combination is treated as undefined and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.
• If the value of the ITD field is 0, then the HLT instruction unconditionally executed.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an Halt Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

The ITD control fields are:

**HSCTLR.ITD**
Applies to execution at EL2 when EL2 is using AArch32.

**SCTLR.ITD**
Applies to execution at EL0 or EL1 when EL1 is using AArch32.

**SCTLR_EL1.ITD**
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

A HLT instruction is always unconditional, even within an IT block.
H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, EDECCR, is set to 1 on all entries to a given Exception level. This means:
  - Exceptions taken to the Exception level.
  - Exception returns to the Exception level.
  - It is IMPLEMENTATION DEFINED whether a reset into an Exception level generates an Exception Catch debug event.
- Might be taken synchronously, after the exception or reset entry or the exception return has been processed by the PE.
- Ignore the Execution state of the target Exception level.
- Might be ignored if halting is prohibited.
- If FEAT_Debugv8p8 is implemented, might be pended.

The EDECCR register contains fields that control when Exception Catch debug events are generated.

See Controlling Exception Catch debug events when FEAT_Debugv8p2 is implemented on page H3-10289 and Controlling Exception Catch debug events when FEAT_Debugv8p2 is not implemented on page H3-10289.

For exception returns, the final Exception level of the exception return determines whether an Exception Catch debug event is generated. On an illegal exception return, an Exception Catch debug event is generated only if EDECCR is programmed to generate an Exception Catch debug event for an exception return to the current Exception level.

H3.4.1 Prioritization of Exception Catch debug events

The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than each of Software Step exceptions and Halting Step debug events.
- Exception Catch debug events are higher priority than all synchronous exceptions other than Software Step exceptions and debug events other than Halting Step debug events.
- Exception Catch debug events are lower priority than Reset Catch debug events.
- When FEAT_Debugv8p2 is implemented and FEAT_Debugv8p8 is not implemented, Exception Catch debug events are higher priority than pending asynchronous exceptions. Otherwise, the prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event, is IMPLEMENTATION DEFINED.

--- Note ---

As described in Prioritization of Synchronous exceptions taken to AArch64 state on page D1-4650, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See Vector Catch exceptions on page D2-4741 or Vector Catch exceptions on page G2-9093.

H3.4.2 Generating Exception Catch debug events when FEAT_Debugv8p2 is not implemented

When an Exception Catch debug event is generated after exception entry and halting is allowed at the target of the exception, the PE halts and enters Debug state:

- The PE halts and enters Debug state before the first instruction at the handler is executed, after the exception entry has updated the program counter, PSTATE, and syndrome registers for the exception.
- The PE does not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.
- A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.
When an Exception Catch debug event is generated on exception return and halting is allowed at the target of the exception return:

- There is no prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event generated on an exception return.
- The PE halts and enters Debug state after the exception return has updated the program counter and PSTATE, and before the execution of the first instruction at the return address is completed.

Otherwise, when the PE is executing code at a given Exception level, and the corresponding EDECCR bit is 1, it is CONstrained UNpredictable whether an Exception Catch debug event is generated.

Examples of this are:

- If the debugger writes to EDECCR so that the current Exception level is trapped.
- If the OS restore code writes to OSECCR so that the current Exception level is trapped.
- If the code executing in AArch32 state changes the Exception level or Security state other than by an exception return, and the target Exception level is trapped. See State and mode changes without explicit context synchronization events on page G2-9100.

See also Debug state entry and debug event prioritization on page H2-10235.

Note

It is possible to generate Exception Catch debug events:

- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in Detailed Halting Step state machine behavior on page H3-10279.

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an ISB operation executed at the Exception level.

H3.4.3 Generating Exception Catch debug events when FEAT_Debugv8p2 is implemented and FEAT_Debugv8p8 is not implemented

Exception Catch debug events are generated as described in Generating Exception Catch debug events when FEAT_Debugv8p2 is not implemented on page H3-10287, except:

- An Exception Catch debug event is generated only on exception entry or return.
- When an Exception Catch debug event is generated after exception entry and halting is allowed at the target of the exception, the PE halts and enters Debug state before any other asynchronous exception or debug event.

H3.4.4 Generating Exception Catch debug events when FEAT_Debugv8p8 is implemented

Exception Catch debug events are generated as described in Generating Exception Catch debug events when FEAT_Debugv8p2 is not implemented on page H3-10287, except:

- An Exception Catch debug event is generated only on exception entry or return.
- When an Exception Catch debug event is generated after exception entry and halting is allowed at the target of the exception, the PE sets EDESR.EC to 1, and one of the following occurs:
  - The PE halts immediately. On entry to Debug state, EDESR.EC might be 0 or 1.
  - The PE might take an unmasked asynchronous exception, changing Exception level. This means that the PE might enter a state where halting is prohibited before the PE halts and enters Debug state.
- When an Exception Catch debug event is generated on exception return and halting is allowed at the target of the exception, EDESR.EC is unchanged.
- When EDESR.EC is 1 and halting is allowed, the PE halts and enters Debug state before completing any instruction.
- When EDESR.EC is 1 and halting is prohibited, an Exception Catch debug event is pending.
- EDESR.EC is cleared to 0 upon:
  - A write of 1 to EDESR.EC.
  - Exit from Debug state.
Note

If EDESR.EC is 1 and the PE executes a Context synchronizing exception return from a state where halting is prohibited to a state where halting is allowed, then the Exception Catch debug event is prioritized over any synchronous exception or synchronous debug event generated by the first instruction after the Context synchronization event, other than possibly a Halting Step debug event or a Software Step exception.

H3.4.5 Controlling Exception Catch debug events when FEAT_Debugv8p2 is implemented

When FEAT_Debugv8p2 is implemented, the fields EDECCR.{NSR, SR, NSE, SE} control generation of Exception Catch debug events:
- On exception entry but not on exception return.
- On exception return but not on exception entry.
- On exception entry and exception return.

Exception entry, reset and exception return Exception Catch debug events are enabled as shown in Table H3-5 on page H3-10289.

<table>
<thead>
<tr>
<th>(NSR)&lt;n&gt;</th>
<th>(NSE)&lt;n&gt;</th>
<th>Behavior on exception return to ELn</th>
<th>Behavior on exception taken to ELn, and if resets are Exception Catch debug events, reset into ELn</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>No action.</td>
<td>No action.</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>Halt if allowed.</td>
<td>Halt if allowed.</td>

<td>0</td>
<td>Halt if allowed.</td>
<td>No action.</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>No action.</td>
<td>Halt if allowed.</td>
</tr>
</tbody>
</table>

H3.4.6 Controlling Exception Catch debug events when FEAT_Debugv8p2 is not implemented

When FEAT_Debugv8p2 is not implemented, all Exception Catch debug events are enabled by a combination of the fields NSE and SE in EDECCR, as shown in Table H3-6 on page H3-10289.

<table>
<thead>
<tr>
<th>(NSE)&lt;n&gt;</th>
<th>Behavior on exception taken to ELn, return to ELn, and if resets are Exception Catch debug events, reset into ELn</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No action.</td>
</tr>
<tr>
<td>1</td>
<td>Halt if allowed.</td>
</tr>
</tbody>
</table>

H3.4.7 Examples of Exception Catch debug events

If EDECCR == 0x0020, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:
- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:
- ELR_EL1 and SPSR_EL1 are written with the preferred return address and PE state for a return to EL0.
- ESR_EL1 and FAR_EL1 are written with the syndrome information for the exception.
Halting Debug Events

H3.4 Exception Catch debug event

- DLR_EL0 is set to VBAR_EL1 + 0x400, the synchronous exception vector.
- DSPSR_EL0 is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:
- An exception taken from EL0 to EL2, in either Security state, or EL3.
- An exception return from EL2, in either Security state, to EL0.
- An exception taken from Secure EL0 to Secure EL1.
- An exception return from EL3 to Secure EL1.

H3.4.8 Pseudocode description of Exception Catch debug events

The pseudocode functions CheckExceptionCatch() and CheckPendingExceptionCatch() are described in Chapter J1 Armv8 Pseudocode.
H3.5  **External Debug Request debug event**

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See Chapter H5 *The Embedded Cross-Trigger Interface*.

--- Note ---

From the introduction of Armv8-A, the implementation of an embedded cross-trigger is required.

---

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

### H3.5.1 Synchronization and External Debug Request debug events

An External Debug Request debug event that is asserted before a Context synchronization event is taken and the PE enters Debug state before the first instruction following the Context synchronization event completes its execution, provided that halting is allowed after completion of the Context synchronization event.

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state.

If the first instruction after the Context synchronization event or after coming out of reset generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

Otherwise, when all of the following are true, External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface:

- Halting is allowed.
- The PE is not in a low-power state that is not required to exit on an External Debug Request. See Core power domain power states on page H6-10336.

External Debug Request is a wake-up event for WFI, WFIT, WFE, or WFET instructions. See Mechanisms for entering a low-power state on page D1-4676.

--- Note ---

These rules are based on the rules that apply when taking asynchronous exceptions. See Asynchronous exception types on page D1-4656.

---

If an unmasked External Debug Request debug event was pending but is changed to not pending before it is taken, then the architecture permits the External Debug Request debug event to be taken, but does not require this to happen. If the External Debug Request debug event is taken then it must be taken before the first Context synchronization event after the External Debug Request debug event was changed to not pending.

Example H3-3 shows an example of the synchronization requirements.

#### Example H3-3 Synchronization requirements

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if DBGEN or SPIDEN or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

---

### H3.5.2 Pseudocode description of External Debug Request debug events

The `ExternalDebugRequest()` function is described in Chapter J1 *Armv8 Pseudocode*.
H3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when enabled and the state of the OS Lock changes from locked to unlocked. When FEAT_DoPD is implemented, CTIDEVCTL.OSUCE enables an OS Unlock Catch debug event, otherwise EDECR.OSUCE enables an OS Unlock Catch debug event.

When the OS Lock is unlocked, the PE sets EDESR.OSUC to 1 if the OS Unlock Catch debug event is enabled, and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. However, this is an indirect write to EDESR.OSUC, meaning the OS Unlock Catch debug event is not guaranteed to be taken before a subsequent Context synchronization event. If the PE enters Debug state or the OS Unlock Catch debug event is disabled before EDESR.OSUC becomes set to 1, then EDESR.OSUC might not be set.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also Synchronization and Halting debug events on page H3-10295.

EDESR.OSUC is cleared to 0 on a Warm reset and on exiting Debug state.

H3.6.1 Using the OS Unlock Catch debug event

When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a debug register that is implemented in the External debug power domain. However, if a debugger attempts to access a debug register that is implemented in the Core power domain when the Core power domain registers cannot be accessed, and that access returns an error, the debugger must retry the access.

Regularly powering down the Core power domain can result in unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in Debug OS Save and Restore sequences on page H6-10342, then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

H3.6.2 Pseudocode description of OS Unlock Catch debug event

The CheckOSUnlockCatch() function is called when the OS Lock is unlocked.

The CheckPendingOSUnlockCatch() function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.
H3.7 Reset Catch debug events

A Reset Catch debug event is generated when enabled, and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting EDESR.RC to 1. When FEAT_DoPD is implemented, CTIDEVCTL.RCE enables a Reset Catch debug event, otherwise EDECR.RCE enables a Reset Catch debug event.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, DLR has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See Synchronization and Halting debug events on page H3-10295 for more information.

This means that EDESR.RC is set to the value of EDECR.RCE or CTIDEVCTL.RCE on a Warm reset. EDESR.RC is cleared to 0 on exiting Debug state.

H3.7.1 Pseudocode description of Reset Catch debug event

The CheckResetCatch() function is called after reset before executing any instruction.

The CheckPendingResetCatch() function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.
H3.8 Software Access debug event

When the value of EDSCR.TDA is 1, software access to the following AArch64 and AArch32 debug System registers generate a Software Access debug event:

- The Breakpoint Value Registers, DBGBVR.
- The Breakpoint Control Registers, DBGBCR.
- The Watchpoint Value Registers, DBGWVR.
- The Watchpoint Control Registers, DBGWCR.

However, EDSCR.TDA is ignored if any of the following applies:

- The value of OSLSR.OSLK == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See Halting allowed and halting prohibited on page H2-10233.
- The register access generates an exception.

Note

- The only accesses to the specified registers that generate a Software Access debug event are:
  - Accesses to System registers in AArch64 state.
  - Accesses to System registers in the (coproc==0b1110) encoding space in AArch32 state.

- Accesses by a PE using the external debug interface never generate a Software Access debug event.

H3.8.1 Pseudocode description of Software Access debug event

The CheckSoftwareAccessToDebugRegisters() function is described in Chapter J1 Armv8 Pseudocode.
H3.9  Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
  - External debug registers.
  - System registers, including system debug registers.
  - Special-purpose registers.
- The state of the external authentication interface.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit Context synchronization event. For more information on the synchronization of register updates, see:

- Synchronization requirements for AArch64 System registers on page D17-5547.
- Synchronization of changes to the external debug registers on page H8-10358.
- State and mode changes without explicit context synchronization events on page G2-9100.

Changes to the external authentication interface do not require explicit synchronization to affect External Debug Request debug events. See Synchronization and External Debug Request debug events on page H3-10291.

For changes that require explicit synchronization, it is CONSTRAINED UNPREDICTABLE whether instructions between the change and the Context synchronization event observe the old state or the new state.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a Context synchronization event before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Breakpoint and Watchpoint debug events. See Synchronization and debug exceptions on page D2-4755 for exceptions taken from AArch64 state, or Synchronization and debug exceptions on page G2-9100 for exceptions taken from AArch32 state.
- The generation of all Halting debug events by instructions.
- Taking a pending Halting debug event or other asynchronous debug event. See:
  - Pending Halting debug events.
  - Synchronization and External Debug Request debug events on page H3-10291.
- The behavior of the Halting Step state machine. See Synchronization and the Halting Step state machine on page H3-10282.

H3.9.1  Pending Halting debug events

A Halting debug event might be pending:

1. If Halting Step of an instruction sets EDESR.SS is set to 1, and halting is prohibited following the step, then the Halting Step state machine is inactive but a Halting Step debug event is pending.
2. If a Reset Catch debug event sets EDESR.RC to 1, and halting is prohibited following reset, then a Reset Catch debug event is pending.
3. If an OS Unlock Catch debug event sets EDESR.OSUC to 1, then an OS Unlock Catch debug event is pending.
4. If FEAT_Debugv8p8 is implemented and an Exception Catch debug event sets EDESR.EC to 1, and before the PE takes the Exception Catch debug event, the PE takes an asynchronous exception, then an Exception Catch debug event is pending.

Pending Halting debug events are taken asynchronously when halting is allowed.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to EDESR.

Any Halting debug event that is observed as pending in the EDESR before a Context synchronization event is taken and the PE enters Debug state before the first instruction following the Context synchronization event completes its execution. This is possible only if halting is allowed after completion of the Context synchronization event.
If the first instruction after the **Context synchronization event** generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

- A Halting Step debug event is pending. \( \text{EDESRS} \cdot \text{SS} = 1 \).
- The **Context synchronization event** is an exception return from a state where halting is prohibited to a state where halting is allowed.

--- **Note** ---

This applies to an exception return from Secure state with \( \text{ExternalSecureInvasiveDebugEnabled()} \) == FALSE to Non-secure state with \( \text{ExternalInvasiveDebugEnabled()} \) == TRUE.

In this case the order in which the debug events are handled is specified to avoid a double-step. See [Entering the active-pending state](#) on page H3-10281.

If \( \text{FEAT Debugv8p8} \) is implemented and \( \text{EDESRE} \cdot \text{EC} \) is 1, when a pending Exception Catch debug event is taken following a **Context synchronization event**, the PE enters Debug state before fetching any instruction:

- At ELn in Non-secure state, if \( \text{EDECCR} \cdot \text{NSE}<n> \) is 1 and address translation is disabled at ELn.
- At ELn in Secure state, if \( \text{EDECCR} \cdot \text{SE}<n> \) is 1 and address translation is disabled at ELn.

If an asynchronous exception is also pending after the **Context synchronization event** then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

--- **Note** ---

These rules are based on the rules that apply to taking asynchronous exceptions. See [Asynchronous exception types](#) on page D1-4656.
Chapter H4
The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the Debug Communications Channel (DCC) and the Instruction Transfer Register (ITR), and associated control flags. It contains the following sections:
• Introduction on page H4-10298.
• DCC and ITR registers on page H4-10299.
• DCC and ITR access modes on page H4-10302.
• Flow control of the DCC and ITR registers on page H4-10306.
• Synchronization of DCC and ITR accesses on page H4-10309.
• Interrupt-driven use of the DCC on page H4-10314.
• Pseudocode description of the operation of the DCC and ITR registers on page H4-10315.

Note
Where necessary, Table K17-1 on page K17-11836 disambiguates the general register references used in this chapter.
H4.1 Introduction

The **Debug Communications Channel**, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the *debug host*.
- The debug implementation on the PE, described as the *debug target*.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The **Instruction Transfer Register**, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.
H4.2 DCC and ITR registers

The DCC comprises data transfer registers, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, EDITR, and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:
- A receive and transmit pair for 32-bit full-duplex operation:
  - The write-only DBGDTRTX_EL0 register to transmit data.
  - The read-only DBGDTRRX_EL0 register to receive data.
- A single 64-bit read/write register, DBGDTR_EL0, for 64-bit half-duplex operation.
- The read/write OSDTRTX_EL1 and OSDTRRX_EL1 registers for save and restore.

In AArch32 state, software can access the data transfer registers only as:
- A receive and transmit pair, for 32-bit full-duplex operation:
  - The write-only DBGDTRTXint register to transmit data.
  - The read-only DBGDTRRXint register to receive data.
- The read/write DBGDTRTXext and DBGDTRRXext registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, DBGDTRRX_EL0 and DBGDTRTX_EL0. Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are EDSCR.{RXfull, TXfull, RXO, TXU}:
- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the Debug system registers in DCCSR.
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in DSCR.
- The flow-control flags are accessible from the external debug interface in EDSCR.

Figure H4-1 on page H4-10300 shows the System register and external debug interface views of the EDSCR and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.
The Debug Communication Channel and Instruction Transfer Register

H4.2 DCC and ITR registers

EDITR and the ITR flow-control flags, EDSCR. [ITE, ITO] are accessible only by the external debug interface:
  - The EDITR specifies an instruction to execute in Debug state.
  - The ITR empty flag, ITE, is used for flow-control.
  - The ITR overrun flag, ITO, reports flow-control errors.

The sticky overflow flag, EDSCR.ERR, is used by both the DCC and ITR to report flow-control errors.

To save and restore the DCC registers for an external debugger over powerdown, software uses:
  - The MDSCR_EL1, OSDTRTX_EL1, and OSDTRRX_EL1 registers in AArch64 state.

Figure H4-1 System register and external debug interface views of EDSCR and DTR registers, Normal access mode

Figure H4-2 External debug interface views of EDSCR and EDITR registers, Normal access mode
The DBGDSCRext, DBGDTRTXext, and DBGDTRRXext registers in AArch32 state.

Note

There is no save and restore mechanism for the ITR registers as the ITR is used only in Debug state.

Figure H4-3 System register views of EDSR and DTR registers for save and restore
The Debug Communication Channel and Instruction Transfer Register

H4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

<table>
<thead>
<tr>
<th>DCC and ITR access mode, links to description</th>
<th>Applies when:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal access mode on page H4-10302</td>
<td>EDSCR.MA == 0 or the PE is in Non-debug state</td>
</tr>
<tr>
<td>Memory access mode on page H4-10303</td>
<td>EDSCR.MA == 1 and the PE is in Debug state</td>
</tr>
</tbody>
</table>

H4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

For accesses by software:
- Direct writes to DBGDTRTX update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from DBGDTRRX return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to DBGDTR_EL0 update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
  - DTRTX is set from bits[31:0] of the transfer register.
  - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from DBGDTR_EL0 return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
  - Bits[31:0] of the transfer register are set from DTRRX.
  - Bits[63:32] of the transfer register are set from DTRTX.

--- Note ---
For DBGDTR_EL0, the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using DCCSR.

For accesses by the external debug interface:
- Writes to EDITR trigger the instruction to be executed if the PE is in Debug state:
  - If the PE is in AArch64 state, this is an A64 instruction.
  - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of DBGDTRTX_EL0 return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to DBGDTRTX_EL0 update the value in DTRTX and do not change TXfull.
- Reads of DBGDTRRX_EL0 return the value in DTRRX and do not change RXfull.
- Writes to DBGDTRRX_EL0 update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in EDSCR.

The PE detects overrun and underrun by the external debug interface, and records errors in EDSCR. {TXU, RXO, ITO, ERR}. See Flow control of the DCC and ITR registers on page H4-10306.

See also Synchronization of DCC and ITR accesses on page H4-10309.
H4.3.2  Memory access mode

When the PE is in Debug state, Memory access mode can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can be enabled only in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- **External reads from DBGDTRTX_EL0 cause:**
  1. The existing value in DTRTX to be returned. This clears EDSCR.TXfull to 0.
  2. The equivalent of LDR W1,[X0],#4, if in AArch64 state, or LDR R1,[R0],#4, if in AArch32 state, to be executed.
  3. The equivalent of the MSR DBGDTRX_EL0,X1 instruction, if in AArch64 state, or the MCR p14,0,R1,c0,c5,0 instruction, if in AArch32 state, to be executed.
  4. EDSCR.{TXfull, ITE} to be set to {1,1}, and X1 or R1 to be set to an UNKNOWN value.

- **External writes to DBGDTRRX_EL0 cause:**
  1. The value in DTRRX to be updated. This sets EDSCR.RXfull to 1.
  2. The equivalent of the instruction MRS X1,DBGDTRRX_EL0, if in AArch64 state, or MRC p14,0,R1,c0,c5,0 if in AArch32 state, to be executed.
  3. The equivalent of the instruction STR W1,[X0],#4, if in AArch64 state, or STR R1,[R0],#4, if in AArch32 state, to be executed.
  4. EDSCR.{RXfull, ITE} to be set to {0,1}, and X1 or R1 to be set to an UNKNOWN value.

- **External reads from DBGDTRRX_EL0 return the last value written to DTRRX.**
- **External writes to EDITR generate an overrun error.**

During these accesses, EDSCR.{TXfull, RXfull, ITE} are used for flow control.

**Note**

An overrun or underrun might result in EDSCR.ERR being set to 1 asynchronously to the sequence of operations that are outlined in this section. As this is timing-dependent, it is UNPREDICTABLE when the EDSCR.ERR flag affects the instructions and therefore whether neither instruction, only the first instruction, or both instructions are executed. If the second instruction is executed, then the first instruction must have been executed. However, in each case X1 or R1 is set to an UNKNOWN value. This means that:

- In both cases, if the memory access instruction is not executed, then the base register X0 or R0 is not updated, meaning the debugger can determine the last accessed location.
- In the list describing External reads from DBGDTRTX_EL0, DTRTX and EDSCR.TXfull get set to UNKNOWN values. If the load was executed, then the value that was read by the PE is lost. This means the operation might need to be repeated by the debugger, and it is not advisable to use Memory access mode to read from read-sensitive locations using the underrun and overrun detection for flow control.
- In the list describing External writes to DBGDTRRX_EL0, EDSCR.RXfull is set to an UNKNOWN value.

A Data Abort from the memory access can also set EDSCR.ERR to 1. See Data Aborts in Memory access mode on page H4-10304.

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to DBGDTRRX_EL0, in AArch64 state, RXfull might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
- Data Aborts occur in order.
• The constraints of the memory type are met.
• In the list describing External reads from DBGDTRTX_EL0 on page H4-10303:
  — The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
  — If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.
• In the list describing External writes to DBGDTRRX_EL0 on page H4-10303:
  — The MSR equivalent operation at step 2 of the sequence returns the value written at step 1.
  — The STR equivalent at step 3 of the sequence writes the value read at step 2.
• If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun.

See Flow control of the DCC and ITR registers on page H4-10306 for more information on overrun and underrun.

Ordering, access sizes and effect on Exclusives monitors

For the purposes of memory ordering, access sizes, and effect on the Exclusives monitor, accesses in Memory access mode are consistent with load/store word instructions executed by the PE.

The simple sequential access model of Memory-access mode, as stated in Memory access mode on page H4-10303, must also be ordered with respect to instructions executed as a result of External writes to EDITR in Normal mode both before and after accesses to the DTR registers in Memory-access mode.

Data Aborts in Memory access mode

If a memory access generates a Data Abort, then:
• The Data Abort exception is taken. See Exceptions in Debug state on page H2-10265:
  — This means EDSR.ERR is set to 1, see Cumulative error flag on page H4-10308.
  — If the Data Abort occurs on stage 2 of an address translation, then the values returned in the ISV field and in bits[23:14] of the ISS are UNKNOWN.
    If this Data Abort is taken to EL2 using AArch64, the ISS is returned by ESR_EL2. ISS encoding for an exception from a Data Abort on page D17-5685 describes the usual encoding of this ISS.
    If EL2 is using AArch32 and this Data Abort is taken to Hyp mode, the ISS is returned by HSR. ISS encoding for exception from a Data Abort on page G8-9538 describes the usual encoding of this ISS.
  • Register R0 retains the address that generated the abort.
  • Register R1 is set to an UNKNOWN value.
  • EDSR.TXfull, for a load, or EDSR.RXfull, for a store, is set to an UNKNOWN value.
  • DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
  • EDSR.ITE is set to 1.

Illegal Execution state exception

If PSTATE.IL is set to 1 when EDSR.MA == 1, then on an external write access to DBGDTRRX_EL0 or an external read from DBGDTRTX_EL0, it is CONSTRAINED UNPREDICTABLE whether the PE:
• Takes an Illegal Execution state exception without performing any operations. In this case:
  — EDSR.ERR is set to 1, see Cumulative error flag on page H4-10308.
  — Register R0 is unchanged.
  — Register R1 is set to an UNKNOWN value.
  — EDSR.TXfull or EDSR.RXfull, as applicable, is set to an UNKNOWN value.
  — DTRTX or DTRRX, as applicable, is set an UNKNOWN value.
  — EDSR.ITE is set to 1.

See also Exceptions in Debug state on page H2-10265.
• Ignores PSTATE.IL.
Note

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting EDSCR.MA to 1. These instructions generate an Illegal state exception if PSTATE.IL is set to 1.

Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
2. The PE makes a memory access to Align(X[0],4) in AArch64 state, or Align(R[0],4) in AArch32 state.
3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
4. The PE does nothing.

Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.

For external writes to DBGDTRRX_EL0, if the PE writes to memory, an UNKNOWN value is written.

For external reads of DBGDTRTX_EL0 an UNKNOWN value is returned.

The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a DBGDTRTX_EL0 read can trigger a TX underrun, and a DBGDTRTX_EL0 write can trigger an RX overrun.

H4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in EDSCR by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see Register access permissions for memory-mapped accesses on page H8-10362.
H4.4 Flow control of the DCC and ITR registers

- **Ready flags.**
- **Buffering writes to EDITR.**
- **Overrun and underrun flags.**
- **Cumulative error flag on page H4-10308.**

### H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
  - \( \text{EDSCR.RXfull} = 1 \) indicates that \( \text{DBGDTTRRX_EL0} \) contains a valid value that has been written by the external debugger and not yet read by software running on the target.
  - \( \text{EDSCR.TXfull} = 1 \) indicates that \( \text{DBGDTTRTX_EL0} \) contains a valid value that has been written by software running on the target and not yet read by an external debugger.

- For the ITR register there is a single ready flag:
  - \( \text{EDSCR.ITE} = 1 \) indicates that the PE is ready to accept an instruction to the ITR.

**Note**

The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if \( \text{EDSCR.ERR} \) is set, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- \( \text{EDSCR.\{RXfull, ITE\}} = \{0, 1\} \) indicates that \( \text{DBGDTTRRX_EL0} \) is empty and the PE is ready to accept a word external write to \( \text{DBGDTTRRX_EL0} \).
- \( \text{EDSCR.\{TXfull, ITE\}} = \{1, 1\} \) indicates that \( \text{DBGDTTRTX_EL0} \) is full and the PE is ready to accept a word external read from \( \text{DBGDTTRTX_EL0} \).

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in Overrun and underrun flags.

\( \text{EDSCR.\{ITE, RXfull, TXfull\}} \) shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, \( \text{EDSCR.ERR} \) is set or the OPTIONAL Software Lock is locked for memory-mapped accesses (\( \text{EDLSR.SLK} = 1 \)).

### H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if \( \text{EDSCR.ERR} \) is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.

- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as \( \text{DCPS} \) or \( \text{DRPS} \).

### H4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to \( \text{EDCR.CSE} \).
The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

Table H4-1 on page H4-10307 shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

<table>
<thead>
<tr>
<th>External debug interface access</th>
<th>Overrun/Underrun condition</th>
<th>EDSCR flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write DBGDTRRX_EL0</td>
<td>EDSCR.RXfull == ‘1’</td>
<td></td>
</tr>
<tr>
<td>Read DBGDTRTX_EL0</td>
<td>EDSCR.TXfull == ‘0’</td>
<td></td>
</tr>
<tr>
<td>Write EDITR</td>
<td>Halted() &amp;&amp; (EDSCR.ITE == ‘0’</td>
<td></td>
</tr>
</tbody>
</table>

When an overrun or underrun flag is set to 1, the cumulative error flag, EDSCR.ERR, described in *Cumulative error flag* on page H4-10308, is also set to 1.

In the event of an external write to DBGDTRRX_EL0 or EDITR generating an overrun, or an external read from DBGDTRTX_EL0 generating an underrun:
- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- EDSCR.TXfull, EDSCR.RXfull or EDSCR.ITE, as applicable, are not updated.

There is no overrun or underrun detection on external reads of DBGDTRRX_EL0 or external writes of DBGDTRTX_EL0.

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:
- If RXfull == 0, a direct read of DBGDTRRX or DBGDTR_EL0 returns UNKNOWN.
- If TXfull == 1, a direct write of:
  - DBGDTRTX sets DTRTX to UNKNOWN.
  - DBGDTR_EL0 sets DTRRX and DTRTX to UNKNOWN.

See *DCC accesses in Non-debug state* on page H4-10310 for more information.

### Accessing 64-bit data

In AArch64 state, a software access to the DBGDTR_EL0 register and an external debugger access to both DBGDTRRX_EL0 and DBGDTRTX_EL0 can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:
- If software directly writes a 64-bit value to DBGDTR_EL0, only TXfull is set to 1, meaning:
  - A subsequent external write to DBGDTRRX_EL0 would not be detected as an overrun.
  - If the external debugger reads DBGDTRTX_EL0 first, software might observe MDCCSR_EL0.TXfull == 0 and send a second value before the external debugger reads DBGDTRRX_EL0, leading to an undetected overrun.
- On external writes to both DBGDTRRX_EL0 and DBGDTRTX_EL0, only RXfull is set to 1, meaning:
  - A subsequent direct write of DBGDTRTX_EL0 would not be detected as an overrun.
  - If the external debugger writes to DBGDTRRX_EL0 first, software might observe MDCCSR_EL0.RXfull == 1 and read a full 64-bit value, before the external debugger writes to DBGDTRTX_EL0, leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:
- The external debugger must check EDSCR.{RXfull, TXfull} before each transfer.
To receive a 64-bit value from the target, the external debugger must read **DBGDTRRX_EL0** before reading **DBGDTRTX_EL0**.

To send a 64-bit value to the target, the external debugger must write to **DBGDTRTX_EL0** before writing **DBGDTRRX_EL0**.

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

### H4.4.4 Cumulative error flag

The cumulative error flag, **EDSCR.ERR**, is set to 1:
- On taking an exception from Debug state.
- On any signaled overrun or underrun in the DCC or ITR.

When **EDSCR.ERR == 1**:
- External reads of **DBGDTRTX_EL0** do not have any side-effects.
- External writes to **DBGDTRRX_EL0** are ignored.
- External writes to **EDITR** are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to **EDITR** that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:
- Check **EDSCR.\{RXfull, TXfull, ITE\}** before each access.
- Check **EDSCR.\{ITO, RXO, TXU\}** following each access, for overrun or underrun.
- Check **PSTATE** or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared to 0 by writing 1 to **EDRCR.CSE**. However, the effect of writing 1 to **EDRCR.CSE** to clear **EDSCR.ERR** is **CONSTRAINED UNPREDICTABLE** when both of the following apply:
- The PE is in Debug state.
- The value of **EDSCR.ITE** is 0.

When these conditions apply and a value of 1 is written to **EDRCR.CSE**, either or both of the following might occur:
- **EDSCR.ERR** is not cleared to 0.
- Any instructions in **EDITR** that have not been executed might be executed subsequently, rather than being ignored.

--- Note ---

This means that a debugger must poll **EDSCR.ITE** until it has the value 1, indicating that **EDITR** is empty, before writing to **EDRCR.CSE** to clear the **EDSCR.ERR** flag to 0.

---

For overruns and underruns, **EDSCR.\{ITO, RXO, TXU\}** record the error type.

### Pseudocode description of clearing the error flag

The **ClearStickyErrors()** pseudocode function is described in Chapter J1 *Armv8 Pseudocode*. 

---
H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- Summary of System register accesses to the DCC.
- DCC accesses in Non-debug state on page H4-10310.
- Synchronization of DCC interrupt request signals on page H4-10312.
- DCC and ITR access in Debug state on page H4-10313.

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

Note

In Synchronization requirements for AArch64 System registers on page D17-5547 external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to DBGDTRRX_EL0 and DBGDTRTX_EL0 are asynchronous to direct reads of, and direct writes to, DBGDTRRX, DBGDTRTX, and in AArch64 state DBGDTR_EL0, made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

**DCC flags**

- The EDSCR.{RXfull.TXfull} ready flags.
- The EDSCR.RXO overrun flag.
- The EDSCR.TXU underrun flag.
- The EDSCR.ERR cumulative error flag.

**ITR flags**

- The EDSCR.ITE ready flag.
- The EDSCR.ITO overrun flag.
- The EDSCR.ERR cumulative error flag.

H4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in Table H4-2 on page H4-10310. Several of these instructions access the same registers using different encodings.

DBGDTRRX_EL0 and DBGDTRTX_EL0 are encoded as MRS and MSR accesses respectively to the same System register, even though they access different underlying register values. DBGDTRRX and DBGDTRTX are similarly encoded as MRC and MCR accesses respectively to the same System register. The encoding means that direct reads and writes using these encodings must be ordered with respect to each other. For more information, see Synchronization requirements for AArch64 System registers on page D17-5547 and Synchronization of changes to AArch32 System registers on page G8-9326.
Table H4-2 on page H4-10310 shows a summary of System register accesses to the DCC.

**Table H4-2 Summary of System register accesses to the DCC**

**H4.5.2 DCC accesses in Non-debug state**

In Non-debug state DCC accesses are as described in *Normal access mode* on page H4-10302:

- If a direct read of DCCSR returns RXfull == 1, then a following direct read of DBGDTRRX, or in AArch64 state of DBGDTR_EL0, returns valid data and indirectly writes 0 to DCCSR.RXfull as a side-effect.
- If a direct read of DCCSR returns TXfull == 0, then a following direct write to DBGDTRTX, or in AArch64 state to DBGDTR_EL0, writes the intended value, and indirectly writes 1 to DCCSR.TXfull as a side-effect.

No *Context synchronization event* is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the **DCC flags** as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of DBGDTRRX is an indirect write to DCCSR.RXfull, it must occur in program order with respect to the direct read of DCCSR, meaning it must not return a speculative value for DTRRX that predates the RXfull flag returned by the read of DCCSR. The direct write to DBGDTRTX must not be executed speculatively.

Direct reads of DBGDTRRX, or in AArch64 state DBGDTR_EL0, and DCCSR, must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the **DCC flags** occurs immediately after the direct DTR access.

**Note**

For an access to DBGDTR_EL0, this means the indirect write happens after both DBGDTRRX_EL0 and DBGDTRTX_EL0 have been accessed.

- In the simple sequential execution model, for an external read of DBGDTRTX_EL0 or an external write of DBGDTRRX_EL0:
  - The check of the **DCC flags** for overrun or underrun occurs immediately before the access.
If there is no underrun or overrun, the update of the DCC flags occurs immediately after the access.

If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

--- Note ---

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

- The value written by the external write to DBGDTRRX_EL0 that does not overrun, must be observable to direct reads of DBGDTRRX and DBGDTR_EL0 in finite time.
- The DCC flags that are updated as a side-effect of the external write or external read must be observable:
  - To subsequent external reads of EDSCR.
  - To subsequent external reads of DBGDTRRX_EL0 when checking for underrun.
  - To subsequent external writes to DBGDTRTX_EL0 when checking for overrun.
  - To direct reads of DCCSR in finite time.

However, explicit synchronization is required to guarantee that a direct read of DCCSR returns up-to-date DCC flags. This means that if a signal is received from another agent that indicates that DCCSR must be read, an ISB is required to ensure that the direct read of DCCSR occurs after the signal has been received. This also synchronizes the value in DBGDTRRX, if applicable. However, if that signal is an interrupt exception triggered by COMMIRQ, COMMTX, or COMMRX, the exception entry is sufficient synchronization. See Synchronization of DCC interrupt request signals on page H4-10312.

Explicit synchronization is required following a direct read or direct write:

- To ensure that a value directly written to DBGDTRTX is observable to external reads of DBGDTRTX_EL0.
- To ensure that a value directly written to DBGDTR_EL0 is observable to external reads of DBGDTRTX_EL0 and DBGDTRRX_EL0.
- To guarantee that the indirect writes to the DCC flags that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
  - Observable to external reads of EDSCR.
  - Observable to external reads of DBGDTRRX_EL0 when checking for underrun.
  - Observable to external writes of DBGDTRTX_EL0 when checking for overrun.
  - Returned by a following direct read of DCCSR.

See also Memory-mapped accesses to the DCC and ITR on page H4-10305 and Synchronization of changes to the external debug registers on page H8-10358.

--- Note ---

These ordering rules mean that software:

- Must not read DBGDTRRX without first checking DCCSR.RXfull or if the previously-read value of DCCSR.RXfull is 0.
  It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.
- Must not write DBGDTRTX without first checking DCCSR.TXfull or if the previously-read value of DCCSR.TXfull is 1.
  The write to DBGDTRTX overwrites the value in DTRTX, and the external debugger might or might not have read this value.
- Must ensure there is an explicit Context synchronization event following a DTR access, even if not immediately returning to read DCCSR again. This synchronization operation can be an exception return.
Derived requirements

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of DBGDTRRX when RXfull is 1:
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write.
  - If an external read of EDSCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by a following external write to DBGDTRRX, and the following external write does not overrun.

- Following a direct read of DBGDTR_EL0, when RXfull is 1:
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write nor by a following direct write to DBGDTRTX.
  - If an external read of EDSCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to DBGDTRRX and DBGDTRTX in any order, and the following external write of DBGDTRRX will not overrun.

- Following a direct write to DBGDTRTX, when TXfull is 0:
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the value returned by the external read must be the value written by the previous direct write.
  - If an external read of EDSCR returns a TXfull value of 1, then the value returned by a following external read of DBGDTRRX must be the value written by the previous direct read, and the subsequent external read will not underrun.

- Following a direct write to DBGDTR_EL0, when TXfull is 0:
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the values returned by the external read and by a subsequent external read of DBGDTRRX must be the value written by the previous direct write.
  - If an external read of EDSCR returns a TXfull value of 1, then the value returned by subsequent external reads of DBGDTRRX and DBGDTRTX, in any order, must be the value written by the previous direct read, and the subsequent external read of DBGDTRTX does not underrun.

- Following an external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0, then the value returned by the external read must not be affected by a following direct write to DBGDTRTX.

- Following a first external read DBGDTRRX and a following second external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0, then the values returned by the external reads must not be affected by a following direct write to DBGDTR_EL0.

- Following an external write to DBGDTRRX that does not overrun, if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a following direct read of DBGDTRRX or DBGDTR_EL0 must be the value written by the previous external write.

- Following a first external write to DBGDTRTX and a following second external write to DBGDTRRX that does not overrun, if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a subsequent direct read of DBGDTR_EL0 must return the values written by the previous external writes.

H4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, COMMIRQ, COMMTX, and COMMRX, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of DCCSR or DBGDTRRX, or a direct write of DBGDTRTX executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of DBGDTRTX executed after taking an interrupt exception generated by the interrupt request.
H4.5 Synchronization of DCC and ITR accesses

Note

The requirement that indirect writes to registers are observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For more information, see Synchronization requirements for AArch64 System registers on page D17-5547 and Synchronization of changes to AArch32 System registers on page G8-9326.

Following a direct read of DBGDTRRX or a direct write to DBGDTRRX, software must execute a Context synchronization event to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

H4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to EDITR must be observable to an external write or an external read in finite time:
  - A direct read of DBGDTRRX must be observable to an external write of DBGDTRRX_EL0.
  - A direct read of DBGDTR_EL0 must be observable to an external write of DBGDTRRX_EL0 and DBGDTRTX_EL0.
  - A direct write of DBGDTRTX must be observable to an external read of DBGDTRTX_EL0.
  - A direct write of DBGDTR_EL0 must be observable to an external read of DBGDTRRX_EL0 and DBGDTRTX_EL0.

This includes the indirect write to the DCC flags that occurs atomically with the access as described in DCC accesses in Non-debug state on page H4-10310.

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and DCC flags. If the old values are observed, this typically results in overrun or underrun, assuming the old values of the DCC flags indicate an overrun or underrun condition, as would normally be the case. This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the DCC flags in EDSCR, because it can rely on overrun and underrun tests.

- External reads of DBGDTRTX_EL0 that do not underrun and external writes to DBGDTRRX_EL0 that do not overrun must be observable to an instruction subsequently written to EDITR on completion of the first external access. This includes the indirect write to the DCC flags.

This means that without explicit synchronization and without the need to first check the DCC flags in DCCSR:

- If the instruction is a direct read of DBGDTRRX, it observes the external write.
- If the instruction is a direct write of DBGDTRTX, it observes the external read.

- Writes to EDITR that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.

- After an external write to the EDITR, the ITR flags that are updated as a side effect of that write must be observable by:
  - An external read of the EDSCR that follows the external write to the EDITR.
  - When checking for overrun, another external write to the EDITR that follows the original external write to the EDITR.

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in Memory access mode on page H4-10303.
H4.6 Interrupt-driven use of the DCC

Arm recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

--- Note ---

- In addition to connection to the interrupt controller Arm also recommends COMMIRQ, COMMTX, and COMMRX signals that might be implemented for use by any legacy system peripherals.
- GICv3 reserves a private peripheral interrupt number for the COMMIRQ interrupt.

The DCCINT register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, COMMIRQ, is needed at the interrupt controller.

See also Synchronization of DCC interrupt request signals on page H4-10312.
H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when OSLSR.OSLK == 1, meaning that the OS Lock is locked:

- DBGDTR_EL0[].
- DBGDTRRX_EL0[].
- DBGDTRTX_EL0[].
- EDITR[].
- CheckForDCCInterrupts().

For the definition of the DTR Registers, see shared/debug/dccanditr/DTR on page J1-11366.
The Debug Communication Channel and Instruction Transfer Register
H4.7 Pseudocode description of the operation of the DCC and ITR registers
Chapter H5
The Embedded Cross-Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- About the Embedded Cross-Trigger on page H5-10318.
- Basic operation on the ECT on page H5-10320.
- Cross-triggers on a PE in an Arm A-profile implementation on page H5-10324.
- Description and allocation of CTI triggers on page H5-10325.
- CTI registers programmers’ model on page H5-10329.
- Examples on page H5-10330.
H5.1 About the Embedded Cross-Trigger

The Embedded Cross-Trigger (ECT) allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs, or other system components, when a trigger event occurs on another PE or system component. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 shows the logical structure of an ECT.

The ECT can deliver many types of trigger events, which are described in the following sections:

- Debug request trigger event on page H5-10326.
- Restart request trigger event on page H5-10326.
- Cross-halt trigger event on page H5-10326.
- Performance Monitors overflow trigger event on page H5-10326.
- Generic trace external input trigger events on page H5-10327.
- Generic trace external output trigger events on page H5-10327.
- Generic CTI interrupt trigger event on page H5-10327.

From the introduction of Armv8, an A-profile implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

In addition, see Cross-triggers on a PE in an Arm A-profile implementation on page H5-10324.

Arm recommends that this cross-trigger interface includes:

- The ability to route trigger events between Trace Units, which typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

Also, Arm recommends that the Embedded Cross-Trigger includes the capability to send and receive IMPLEMENTATION DEFINED system trigger events to and from other system components, including a system counter, using a system CTI. See Halt-on-debug on page I2-10726.

Note

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.
H5.1 About the Embedded Cross-Trigger

Note

CTI version 1 (CTIv1) is defined by the CoreSight™ SoC Technical Reference Manual. CTIv2 extends CTIv1 with the addition of the input channel gate. See Implementation with CTIv2.

H5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections for an A-profile implementation, see Appendix K6 Recommended External Debug Interface. See also CoreSight™ SoC Technical Reference Manual.

H5.1.2 Implementation with CTIv2

If the CTI implemented is CTIv2 then:

- The CTIDEVARCH, CTIDEVAFF0, and CTIDEVAFF1 registers must be implemented.
- If the channel gate function is implemented, it applies to both input and output channels.
- The input channel gate function must be implemented if either of the following is true:
  - The CTM is implemented and the architecture variant is Armv8.5 or higher.
  - The CTIDEVARCH.REVISION field reads as 0b0001 or higher.

Implementation of CTIv2 features in architecture variants below Armv8.5 is OPTIONAL, but Arm recommends that CTIv2 is implemented, CTIv2 must be implemented from Armv8.5.
H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The ECT might also include other CTIs for other system components. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the cross-trigger interface, CTI, are:

- The input triggers:
  - These are trigger event inputs from the PE to the CTI.
- The output triggers:
  - These are trigger event outputs from the CTI to the PE.
- The input channels:
  - These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.
- The output channels:
  - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
  - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
  - The output triggers are numbered 0-31.

If the CTI is not powered up when the Core power domain is powered up, the CTI ignores all input triggers and input channel events, and does not generate any output triggers or output channel events.

Figure H5.2 on page H5-10321 shows the logical internal structure of a CTI.
Note

- The number of triggers in IMPLEMENTATION DEFINED. Figure H5-2 shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. Figure H5-2 shows four channels.
- In Figure H5-2 the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the mapping function defined by the Input trigger→output channel mapping registers, CTIINEN[n].

The CTI also contains an application trigger and channel pulse to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.
Channel events on each internal channel are passed to a corresponding output channel that is controlled by a channel gate. The channel gate can block propagation of channel events from an internal channel to an output channel.

--- Note ---
If the CTM is implemented:
• The gate function must be implemented.
• If the CTI is CTIv1, the gate function applies to output triggers only.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the cross-trigger matrix, CTM. Therefore, the number of input channels must equal the number of output channels.

--- Note ---
The number of input triggers and output triggers is not required to be the same.

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

--- Note ---
If CTIv2 is implemented, the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the Input channel \(\rightarrow\) output trigger mapping registers, CTIOUTEN\(<n>\).

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:
• It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
• It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See Multicycle events.

However, an output trigger is asserted until acknowledged. The output trigger can be:
• Self-acknowledging. This means that no further action is required from the debugger.
• Acknowledged by the debugger writing 1 to the corresponding bit of CTIINTACK.

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

--- Note ---
Arm recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

### H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.
CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

**Note**

A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

---

**An ECT that supports multicycle trigger events**

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

**Note**

The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

---

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

**CTIAPPSET** and **CTIAPPCLEAR** can set a channel active for multiple cycles. **CTIAPPULSE** generates a single channel event. **CTICHINSTATUS** and **CTICHOUTSTATUS** can report whether a channel is active.

---

**An ECT that does not support multicycle trigger events**

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

**Note**

A single event is typically a single cycle, but there is no guarantee that this is always the case.

---

**CTIAPPSET** and **CTIAPPCLEAR** can only generate a single channel event. **CTIAPPULSE** generates a single channel event. If the ECT does not support multicycle channel events, use of **CTIAPPSET** and **CTIAPPCLEAR** is deprecated, and the debugger must only use **CTIAPPULSE**. **CTICHINSTATUS** and **CTICHOUTSTATUS** must be treated as **UNKNOWN**.
H5.3 Cross-triggers on a PE in an Arm A-profile implementation

An A-Profile PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the PE that includes the cross-trigger interface, but can also connect to additional PEs. Arm strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes other PEs that can be connected using a CoreSight CTI module.

Note

In a uniprocessor system the CTM is OPTIONAL. In a multiprocessor system the CTM is required. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. Arm recommends that the CTM is implemented.

Any CTI connected to a PE that is not an Arm PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the CoreSight™ SoC Technical Reference Manual. Arm architecture refines the generic CTI by defining roles for each of the implemented input and output triggers.
H5.4 Description and allocation of CTI triggers

Table H5-1 on page H5-10325 shows the output trigger events defined by the architecture and the related trigger numbers.

Table H5-1 Allocation of CTI output trigger events

</tr>
</tbody>
</table>

Note

Input triggers to the CTI are outputs from other blocks.

Table H5-1 on page H5-10325 and Table H5-2 on page H5-10325 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are required only if the OPTIONAL trace unit is implemented. If the OPTIONAL trace unit is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. Arm strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

From the introduction of Armv8-A, an implementation can extend the CTI with additional triggers. These start with the number eight.
H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[0].

Note

A debugger must poll CTITRIGOUTSTATUS[0] until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also External Debug Request debug event on page H3-10291.

H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is in Non-debug state, the request is ignored by the PE.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is CONstrained UNpredictable whether:

• The request is ignored by the PE. In this case the PE enters Debug state and remains in Debug state.
• The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use EDPRSR.{SDR, HALTED} to determine the Execution state of the PE.

Note

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. Debug request trigger event describes how to do this.

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. The trigger event is acknowledged even if the request is ignored by the PE. See also Exiting Debug state on page H2-10271.

H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

Note

To reduce the latency of halting, Arm recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, which might be derived from the Cross-halt trigger event, to be recorded in the EDSR.STATUS field. This applies to Debug request trigger events that are acting as inputs to the PE.

H5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts a new Performance Monitors counter overflow interrupt request. See Chapter D11 The Performance Monitors Extension.
If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared by a write to PMOVSCLR_EL0. Otherwise, the trigger event is asserted when the value of PMOVSCLR_EL0 changes from zero to a nonzero value.

**Note**
- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
- Events can be counted when ExternalNoninvasiveDebugEnabled() == FALSE, and, in Secure state, when ExternalSecureNoninvasiveDebugEnabled() == FALSE. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.

### H5.4.5 Statistical Profiling Extension sample trigger event

If the Statistical Profiling Extension is implemented, and a sample record is written to memory, CTI input trigger 2 is asserted. This trigger might also be directly connected to other IMPLEMENTATION DEFINED debug features.

For more information, see Chapter D13 *The Statistical Profiling Extension*.

### H5.4.6 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL trace unit, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:
- The PE and the OPTIONAL trace unit.
- The OPTIONAL trace unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

### H5.4.7 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL trace unit, used in conjunction with the Generic trace external input trigger events to pass trigger events between:
- The PE and the OPTIONAL trace unit.
- The OPTIONAL trace unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external output trigger events.

### H5.4.8 Generic CTI interrupt trigger event

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, trace units, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

**Note**
- Arm recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.
- GICv3 reserves a private peripheral interrupt number for this interrupt.

It is IMPLEMENTATION DEFINED whether this trigger event is:
- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.
• Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[2]. This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

Arm recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.
H5.5 CTI registers programmers’ model

The CTI registers programmers’ model is described in Chapter H8 About the External Debug Registers. The following sections contain information specific to the CTI:

- External debug register resets on page H8-10378.
- External debug interface register access permissions on page H8-10364.
- Cross-trigger interface registers on page H8-10375.
- The individual register descriptions in Cross-Trigger Interface registers on page H9-10660.

See also Memory-mapped accesses to the external debug interface on page H8-10362.

H5.5.1 CTI reset

An External Debug reset resets the CTI. See External debug register resets on page H8-10378 for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

--- Note ---

An indirect read of an output trigger might not observe the deasserted state until the processor is Cold reset. For more information, see Synchronization of changes to the external debug registers on page H8-10358.

H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

- CTRIGINSTATUS shows the status of the input triggers and CTICHINSTATUS shows the status of the input channels, regardless of the value of ExternalNoninvasiveDebugEnabled().

--- Note ---

The PE does not generate the Cross-halt trigger event and the trace unit does not generate Generic trace external output trigger events when ExternalNoninvasiveDebugEnabled() == FALSE. However, the PE can generate Performance Monitors overflow trigger events.

--- Note ---

The CTI can generate external triggers regardless of the value of ExternalInvasiveDebugEnabled().

--- Note ---

The PE ignores Debug request and Restart request trigger events when ExternalInvasiveDebugEnabled() == FALSE. The trace unit ignores Generic trace external input trigger events when ExternalNoninvasiveDebugEnabled() == FALSE. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when ExternalInvasiveDebugEnabled() == FALSE.
The Embedded Cross-Trigger Interface

H5.6 Examples

The Cross-trigger Interface (CTI) is fully programmable and allows for flexible cross-triggering of events within a Processing Element (PE) and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

**Note**

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. Arm recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the trace unit. They can do this:
  - To pass trace events between Trace Units.
  - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the PE trace unit.
  - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
  - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- **Halting a single PE.**
- **Halting all PEs in a group when any one PE halts.**
- **Synchronously restarting a group of PEs on page H5-10331.**
- **Halting a single PE on Performance Monitors overflow on page H5-10331.**

Example H5-1 Halting a single PE

To halt a single PE, set:

1. CTI$\text{GATE}[0]$ to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. CTI$\text{OUTEN}[0]$ to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

**Note**

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of CTI$\text{OUTEN}<n>$ for which $<n>$ is 0.

3. CTI$\text{APPULSE}[0]$ to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to CTI$\text{INTACK}[0]$, before restarting the PE.

Example H5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. CTI$\text{GATE}[2]$ to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. CTI$\text{INEN}[2]$ to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. **CTIOUTEN0[2]** to 1, so that each CTI generates a Debug request trigger event in response to a channel event on channel 2.

   __Note__
   The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of **CTIINEN<n>** and **CTIOUTEN<n>** for which <n> is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to **CTIINTACK[0]**, before restarting the PE.

---

**Example H5-3 Synchronously restarting a group of PEs**

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
   a. Writing 1 to **CTIINTACK[0]** to clear the Debug request trigger event.
   b. Polling **CTITRIGOUTSTATUS[0]**, until it reads as 0, to confirm that the trigger event has been deasserted.

2. Set **CTIGATE[1]** to 1, so that each CTI passes channel events on internal channel 1 to the CTM.

3. Set **CTIOUTEN1[1]** to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

   __Note__
   This example must use the instance of **CTIOUTEN<n>** for which <n> is 1.

4. Set **CTIAPPPULSE[1]** to 1 on any one PE in the group, to generate a channel event on channel 1.

---

**Example H5-4 Halting a single PE on Performance Monitors overflow**

To halt a single PE on a Performance Monitors overflow set:

1. **CTIGATE[3]** to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.

2. **CTIINEN1[3]** to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

   __Note__
   This step of this example must use the instance of **CTIINEN<n>** for which <n> is 1.

3. **CTIOUTEN0[3]** to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

   __Note__
   This step of this example must use the instance of **CTIOUTEN<n>** for which <n> is 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to **CTIINTACK[0]**, before restarting the PE. Clear the overflow status by writing to **PMOVSCLR_EL0**.
The Embedded Cross-Trigger Interface
H5.6 Examples
Chapter H6
Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- About Debug over powerdown on page H6-10334.
- Power domains and debug on page H6-10335.
- Core power domain power states on page H6-10336.
- Emulating low-power states on page H6-10340.
- Powerup request mechanism on page H6-10338.
- Debug OS Save and Restore sequences on page H6-10342.
- Reset and debug on page H6-10348.

Note
Where necessary, Table K17-1 on page K17-11836 disambiguates the general register references used in this chapter.
H6.1 About Debug over powerdown

Arm A-profile external debug defines a logical model for the hardware on which a PE executes. This hardware is logically split into the **Core power domain** and the **Debug power domain**, and the model contains descriptions of the states of those domains. See:

- *Power domains and debug* on page H6-10335.
- *Core power domain power states* on page H6-10336.

An implementation may allow power domains to be powered up and down independently. Debug over powerdown provides:

- A facility for software executing on the PE to save and restore the PE state on behalf of a self-hosted or external debugger or both. See *Debug OS Save and Restore sequences* on page H6-10342.
- A facility for an external debugger to request power up of the Core power domain. See *Powerup request mechanism* on page H6-10338.
- A facility for an external debugger, or software executing on the PE, to request emulation of powerdown of the Core power domain. See *Emulating low-power states* on page H6-10340.
H6.2 Power domains and debug

Arm A-profile external debug has two logical power domains, each with its own reset:

- The Debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a register that is implemented in the Debug power domain. Registers in this domain are reset by an External Debug reset.
- The Core power domain contains the rest of the PE, and might be allowed to power up and power down independently of the Debug power domain.

--- Note ---
- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers’ model.
- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers’ model is a valid implementation.

The Core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

For information about which groups of registers and components are in each power domain, and which registers change power domain if FEAT_DoPD is implemented, see:

- Access permissions for the External debug interface registers on page H8-10370.
- Cross-trigger interface registers on page H8-10375.
- Management register access permissions on page K6-11689.
- Access permissions for external views of the Performance Monitors on page I3-10736.
H6.3 Core power domain power states

The Arm architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. Arm A-profile external debug uses a four logical power states model for the Core power domain. *Mechanisms for entering a low-power state on page D1-4676* describes the architectural mechanisms for entering low-power states.

When the PE enters a low-power state other than Powerdown by executing a WFI, WFET, WFE, or WFET instruction, it remains in that low-power state until it receives a wake-up event. See *Mechanisms for entering a low-power state on page D1-4676* for the definition of wake-up events. When halting is allowed, an External Debug Request is a wake-up event. In addition, if the PE enters the Standby state for any reason, it will leave that state to service an External Debug Request debug event.

The four logical power states are as follows:

**Normal**

The Core power domain is fully powered up and the debug registers are accessible.

**Standby**

The Core power domain is on, but there are measures to reduce energy consumption. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby.

The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE.

Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:

- If the external debug interface is accessed, the PE must respond to that access. Arm recommends that, if the PE executed a WFI or WFE instruction to enter standby, then it does not retire that instruction.

--- Note ---

When FEAT_WFxT is implemented, this also applies to the WFET and WFIT instructions.

---

Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.

**Retention**

The PE state, including debug settings, is preserved in low-power structures, allowing the Core power domain to be at least partially turned off.

Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a software-visible retention state. It is IMPLEMENTATION DEFINED whether the value of DBGPRCR.CORENPDRQ is set to its Cold reset value on leaving the software-visible retention state. See the description of DBGPRCR.CORENPDRQ for more information.

--- Note ---

- This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.

---

**Powerdown**

These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown.

If FEAT_DoubleLock is implemented, it is used during powerdown.

Changing from powerdown to normal operation must include:

- A Cold reset of the PE after the power level has been restored.
- The OS restoring the saved PE state.

External Debug Request debug events stay pending and debug registers in the Core power domain cannot be accessed.
An implementation might support enabling and disabling threads, either dynamically or once at reset time. Threads that are disabled in this way must appear to the external debugger as either:

- Powered off, meaning they are either:
  - In a powerdown state.
  - In a retention state.
- Held in reset state.

Arm A-profile external debug uses a simpler two states model for the Debug power domain. The two states are:

**Off**
- The Debug power domain is turned off.

**On**
- The Debug power domain is turned on.

The available power states, including the cross-product of Core power domain and Debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

--- Note

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the Debug power domain to be on when the Core power domain is off.

---

If the Debug power domain is implemented but is not powered up when the Core power domain is powered up, the Reset Catch debug event and the OS Unlock Catch debug event are disabled.

**H6.4 Powerup request mechanism**

If a powerup request mechanism is implemented, asserting the powerup request requests the power controller to power up the Core power domain, and to emulate any subsequent powerdown requests, until the powerup request mechanism is deasserted.

**H6.4.1 Powerup request mechanism if FEAT_DoPD is implemented**

If FEAT_DoPD is implemented, the external debug component implements an OPTIONAL powerup request mechanism.

If the powerup request mechanism is implemented, Arm strongly recommends that the powerup request is a CoreSight Class 0x9 ROM table block that contains both:

- A parent entry for the debug registers of the PE.
- A parent entry for the PMU registers of the PE, if the OPTIONAL PMU with an external debug interface is implemented.

A parent entry of a component is an entry in a ROM table that either locates the component, or locates another ROM table that contains the parent entry for the component.

--- **Note** ---

The ROM table and any descendants might describe other debug components, including debug components for other PEs.

The ROM table might have a parent entry in a second ROM table and that parent entry might also have a powerup request mechanism in the second ROM table. This applies recursively.

---

The parent entries for the debug components have the following properties:

**For the debug registers and Performance Monitors registers:**

These components are in the Core power domain.

The POWERIDVALID bit is 1.

All parent entries must have the same IMPLEMENTATION DEFINED POWERID value.

--- **Note** ---

The IMPLEMENTATION DEFINED POWERID value does not need to be unique for each PE.

---

**For the CTI registers:**

This component is in the Debug power domain.

The POWERIDVALID bit is IMPLEMENTATION DEFINED.

If the POWERIDVALID bit is 1, the entries must have a valid POWERID value.

--- **Note** ---

If the Core power domain can be powered down independently of the Debug power domain, Arm recommends the system implements an external debug component with a powerup request mechanism which can request the Core power domain to be powered up.

---

For more information about CoreSight Class 0x9 ROM Tables, see *ARM® CoreSight™ Architecture Specification*.

On a Cold reset, if FEAT_DoPD is implemented, DBGPRCR.CORENPDRQ is set to an IMPLEMENTATION DEFINED choice between 0 and 1 if the powerup request is implemented and asserted, and 0 otherwise.

**H6.4.2 Powerup request mechanism if FEAT_DoPD is not implemented**

If FEAT_DoPD is not implemented, the bit EDPRCR.COREPURQ is the powerup request mechanism.
The control registers DBGPRCR.CORENPDRQ and EDPRCR.COREPURQ provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface.

On Cold reset, if FEAT_DoPD is not implemented, DBGPRCR.CORENPDRQ is set to the value of EDPRCR.COREPURQ.
H6.5 Emulating low-power states

DBGPRCR.CORENPDRQ and the powerup request mechanism can request the power controller to emulate states where the Core power domain is completely off or in a low-power state where the Core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.

If FEAT_DoPD is not implemented, EDPRSR.{SPD, PU} indicates the Core power domain power state. For more information, see:

• The DBGPRCR_EL1 and DBGPRCR System register descriptions.
• The EDPRCR and EDPRSR external debug register descriptions.
• Appendix K6 Recommended External Debug Interface.

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug, PMU, CTI, and trace unit registers that are accessible on the external debug interface and are in one of:

• The Debug power domain.
• The Core power domain.
• When a trace unit with a separate trace unit Core power domain is implemented, and the trace unit Core power domain is powered on, the trace unit Core power domain.

That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence.

Arm recommends that any IMPLEMENTATION DEFINED registers that are on the external debug interface and in either the Core power domain or the Debug power domain are also accessible in an emulated powerdown state.

If FEAT_DoubleLock is implemented, DoubleLockStatus() == FALSE when DBGPRCR.CORENPDRQ == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

Example H6-1 and Example H6-2 are examples of two approaches to emulating powerdown.

Example H6-1: An example of emulating powerdown

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

Example H6-2: Another example of emulating powerdown

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset. As such, the effect of accessing any register that is reset by a Warm reset while the PE is in the emulated powerdown state will have an IMPLEMENTATION DEFINED effect on that register.
Note

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, RMR_ELx is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.

- The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.

- Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.
H6.6 Debug OS Save and Restore sequences

From the introduction of Armv8-A, the following registers provide the OS Save and Restore mechanism:

- The **OS Lock Access Register**, OSLAR, locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The **OS Lock Status Register**, OSLSR, shows the status of the OS Lock.
- The PE can be configured to generate an OS Unlock Catch debug event on page H3-10292 when the OS Lock is unlocked.
- If **FEAT_DoubleLock** is implemented, the OS Double Lock locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:
- **FEAT_DoubleLock** on page A2-78
- **Reset and debug** on page H6-10348
- **Appendix K10 Example OS Save and Restore Sequences**

H6.6.1 EDPRSR.{DLK, SPD, PU} and the Core power domain

If **FEAT_DoPD** is not implemented, a debugger uses EDPRSR.{DLK, SPD, PU} to determine whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read.

If **FEAT_DoPD** is implemented, accesses to EDPRSR return an error when the Core power domain is off or in a retention state, meaning successful reads of EDPRSR always return 1 for EDPRSR.PU.

When **FEAT_Debugv8p4** is implemented, and whenever **FEAT_DoubleLock** is not implemented, EDPRSR.DLK is always 0.

If **FEAT_DoubleLock** is not implemented, **DoubleLockStatus()** always returns FALSE.

If the Core power domain is powered up and **DoubleLockStatus()** == TRUE, then:

- When **FEAT_Debugv8p2** is not implemented, EDPRSR.{DLK, SPD, PU} can read either {1, UNKNOWN, 1} or {UNKNOWN, 0, 0}.
- When **FEAT_Debugv8p2** is implemented, and **FEAT_Debugv8p4** is not implemented, EDPRSR.{DLK, SPD, PU} can only read {UNKNOWN, 0, 0}.

<table>

</table>

**Table H6-1 Interpretation of the EDPRSR.{DLK, SPD, PU} bits**
H6.6.2 EDPRSR.SPD when the Core domain is in either retention or powerdown state

If FEAT_DoPD is not implemented, when the Core power domain is in either the retention or powerdown state, EDPRSR.SPD is not cleared following a read of EDPRSR and it is IMPLEMENTATION DEFINED whether:

- EDPRSR.SPD shows whether the state of the debug registers in the Core power domain has been lost since the last time that EDPRSR was read. This means that:
  - When the Core power domain is in the powerdown state, EDPRSR.SPD is RAO, this indicates that the state of the debug registers has been lost.
  - When the Core power domain is in the retention state, EDPRSR.SPD indicates whether the state of the debug registers was lost before the Core power domain entered retention state.

- EDPRSR.SPD is RAZ, and:
  - On leaving the powerdown state, EDPRSR.SPD is set to 1 which indicates that the state of the debug registers has been lost.
  - On leaving the retention state, EDPRSR.SPD reverts the value it had on entering the retention state.

Note

If FEAT_DoPD is implemented, accesses to EDPRSR return an error when the Core power domain is off or in a retention state.

H6.6.3 EDPRSR.{DLK, R} and reset state

If FEAT_DoPD is implemented, accesses to EDPRSR return an error when the Core power domain is off or in a retention state, meaning successful reads of EDPRSR always return 1 for EDPRSR.PU.

When FEAT_Debugv8p4 is implemented, and whenever FEAT_DoubleLock is not implemented, EDPRSR.DLK is always 0.

If FEAT_DoubleLock is not implemented, DoubleLockStatus() always returns FALSE.

If FEAT_DoubleLock is implemented and enabled, the behavior of all registers and fields except EDPRSR.DLK is the same as their behavior if FEAT_Debugv8p4 is not implemented.

If FEAT_Debugv8p4 is implemented EDPRSR.DLK is always 0 and does not give any information about the OS Double Lock.

EDPRSR.R is UNKNOWN when DoubleLockStatus() == TRUE. OSDLR_EL1.DLK is cleared to 0 by a reset. If the Core power domain is powered up and entered reset state with the OS Double Lock locked, it is CONSTRAINED UNPREDICTABLE whether a read of EDPRSR while the PE is in reset state returns:

- EDPRSR.{DLK, R, PU} == {1, UNKNOWN, 1} indicating that the OS Double Lock is locked. This is not permitted from Armv8.2.
- EDPRSR.{DLK, R, PU} == {0, 1, 1} indicating that the PE is in reset state.
- EDPRSR.{DLK, R, PU} == {UNKNOWN, UNKNOWN, 0} indicating that the registers in the Core power domain cannot be accessed because the OS Double Lock is locked.

If the PE was powered up and the OS Double Lock was unlocked when the PE was reset, then EDPRSR.{DLK, R, PU} reads as {0, 1, 1} while the PE is in reset state.

On leaving reset state, EDPRSR.{DLK, R} reads as {0, 0}.

H6.6.4 Debug registers to save over powerdown

Table H6-2 on page H6-10344 shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.
The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:

- Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when OSLSR.OSLK is locked. These registers include OSECCR, OSDTRRX, and OSDTRTX.

- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. DBGVCR32_EL2 and SDER32_EL3 are only required to support AArch32.

Table H6-2 does not include registers for the optional Trace and Performance Monitor extensions.

**H6.6.5 OS Save sequence**

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

1. Lock the OS Lock by:
   - Writing the key value 0xC5ACCE55 to the DBGOSLAR in AArch32 state.
   - Writing 1 to OSLAR_EL1.OSLK in AArch64 state.

2. Execute an ISB instruction.

3. Walk through the debug registers listed in *Debug registers to save over powerdown* on page H6-10343 and save the values to the nonvolatile storage.

If the FEAT_DoubleLock is implemented, before removing power from the Core power domain, software must:

1. Lock the OS Double Lock by:
   - Writing 1 to DBGOSDLR.DLK in AArch32 state.
   - Writing 1 to OSDLR_EL1.DLK in AArch64 state.

If FEAT_DoubleLock is not implemented, OSDLR_EL1 and DBGOSDLR ignore writes.
2. Execute a Context synchronization event.

H6.6.6 OS Restore sequence

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. Lock the OS Lock, as described in OS Save sequence on page H6-10344. The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.

2. Execute an ISB instruction.

3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
   - Write 0 to MDSCR_EL1 if executing in AArch64 state.
   - Write 0 to DBGDSCRExt if executing in AArch32 state.

4. Walk through the debug registers listed in Debug registers to save over powerdown on page H6-10343, and restore the values from the nonvolatile storage. The last register to be restored must be:
   - MDSCR_EL1 if executing in AArch64 state.
   - DBGDSCRExt if executing in AArch32 state.

5. Execute an ISB instruction.

6. Unlock the OS Lock by:
   - Writing any non-key value to DBGOSLAR if executing in AArch32 state.
   - Writing 0 to OSLAR_EL1.OSLK if executing in AArch64 state.

7. Execute a Context synchronization event.

--- Note

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

H6.6.7 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

- Access to debug registers through the System register interface is mainly unchanged except that:
  - Certain registers are read and written without side-effects.
  - Fields in DSCR and OSECCR that are normally read-only become read/write.

This allows the state to be saved or restored. For more information, see the relevant register description in Chapter H9 External Debug Register Descriptions.

- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information, see External debug interface register access permissions summary on page H8-10365.

- Debug exceptions, other than Breakpoint Instruction exceptions are not generated.

- Breakpoint and Watchpoint debug events are not generated. The OS Lock has no effect on Breakpoint Instruction exceptions and other debug events.

H6.6.8 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, the PE sets EDESR.OSUC to 1 if the OS Unlock Catch debug event is enabled and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. See OS Unlock Catch debug event on page H3-10292.
H6.6.9 Debug behavior when the OS Double Lock is locked

If the FEAT_DoubleLock is implemented, software locks the OS Double Lock immediately before a powerdown sequence.

The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When DoubleLockStatus() == TRUE:
- The external debug interface has only restricted access to the debug registers, so that it is quiescent before removing power. See External debug interface register access permissions summary on page H8-10365.
- Debug exceptions, other than Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See Halting allowed and halting prohibited on page H2-10233.

Note
Pending Halting debug events might be lost when core power is removed.

- No asynchronous debug events are WFI wake-up events.

If the FEAT_DoubleLock is not implemented, the PE ensures these conditions are met before allowing power to be removed.

Software must synchronize the update to OSDLR before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the OSDLR update before issuing the WFI instruction.

OSDLR.DLK is ignored and DoubleLockStatus() == FALSE if either:
- The PE is in Debug state.
- DBGPRCR.CORENPDRQ is set to 1.

Note
It is possible to enter Debug state with OSDLR.DLK set to 1. This is because a Context synchronization event is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the OSDLR update is synchronized.

Because OSDLR.DLK is ignored when DBGPRCR.CORENPDRQ is set to 1, an external debugger can write to DBGPRCR.CORENPDRQ, and the FEAT_DoubleLock is not always implemented, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. Arm deprecates use of the OS Double Lock for these purposes, and instead recommends that software:
- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, if the FEAT_DoubleLock is implemented, it is important to avoid race conditions that defeat this purpose. Arm recommends that:
- Once the write to OSDLR.DLK has been synchronized by a Context synchronization event and DoubleLockStatus() == TRUE, a PE must:
  - Not allow a debug event generated before the Context synchronization event to cause an entry to Debug state or act as a wake-up event for a WFI or WFE instruction after the Context synchronization event has completed.

Note
When FEAT_WFxT is implemented, this also applies to the WFET and WFIT instructions.

- Complete any external debug access started before the Context synchronization event by the time the Context synchronization event completes.
--- Note ---

A debug register access might be in progress when software sets OSDLR.DLK to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets OSDLR.DLK to 1 must complete or return an error in finite time.

- If a write to DBGPRCR or EDPRCR made when OSDLR.DLK == 1 changes DBGPRCR.CORENPDRQ or EDPRCR.CORENPDRQ from 1 to 0, meaning DoubleLockStatus() changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for DoubleLockStatus() == TRUE listed in this section are met.

In a standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if DoubleLockStatus() == FALSE, an external debugger can clear the OS Lock at any time, and then write to EDPRCR.
H6.7 Reset and debug

All registers in the Core power domain are either:
• Reset by both a Cold and a Warm reset.
• Reset only by a Cold reset and are not changed by a Warm reset.

For more information, see Resets and power domains on page D1-4673.

All registers in the Debug power domain are reset by an External Debug reset.

Figure H6-1 shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:
• CORERESET, which must be asserted for a Warm reset.
• CPUPORESET, which must be asserted for a Cold reset.
• PRESETDBG, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

![Figure H6-1 Power and reset domains](image)

For more information about power domains and power states, see Power domains and debug on page H6-10335.

When power is first applied to the Debug power domain, PRESETDBG must be asserted.

When power is first applied to the Core power domain, CPUPORESET must be asserted.

Note

In this scheme, logic in the Warm reset domain is reset by asserting either CORERESET or CPUPORESET. This implies a particular implementation style that permits these approaches.

CPUPORESET is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also Emulating low-power states on page H6-10340 and the EDPFR register description.

H6.7.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:
• Writes a register, or indirectly writes a register or register field as a side-effect of an access:
  • Then, if the register or register field is reset by that reset signal, it is CONSTRAINED UNPREDICTABLE whether the register or register field takes the reset value or the value written. The reset value might be UNKNOWN.
— Otherwise, the register or register field takes the value that is written.

• Reads a register, or indirectly reads a register or register field, as part of an access:
  — Then, if the register or register field is reset by that reset signal, the value returned in UNKNOWN.
  — Otherwise, the value of the register or register field is returned.

It is IMPLEMENTATION DEFINED whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is IMPLEMENTATION DEFINED.
Debug Reset and Powerdown Support
H6.7 Reset and debug
Chapter H7
The PC Sample-based Profiling Extension

This chapter describes the OPTIONAL PC Sample-based Profiling Extension that provides a non-invasive external debug component.

It contains the following section:
- About the PC Sample-based Profiling Extension on page H7-10352.
H7.1 About the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension is an OPTIONAL extension that provides coarse-grained, non-invasive profiling by an external debugger. See also Non-invasive behavior on page D11-5248.

PC Sample-based Profiling creates samples so that tools can populate a statistical model of the performance of software executing on the PE.

Note

Data returned by periodic sampling of PC Sample-based Profiling registers is sufficient to allow tools to estimate the distribution of time spent executing software on the PE.

The delay between an instruction being executed by the PE and its address appearing in the PC Sample Register is not defined, and the architecture does not require that the sampled instruction was recently executed. For example, if a piece of software executes a load instruction that reads the PC Sample Register of the PE it is running on, there is no guaranteed relationship between the address of the load instruction and the value read. The PC Sample Register is intended only for use by an external agent to provide statistical information for software profiling.

It must be possible to sample references to branch targets. It is IMPLEMENTATION DEFINED whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. Arm does not define a reasonable degree of inaccuracy but recommends the following guidelines:

- In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.
- Under unusual non-repeating pathological cases, the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.
- Under normal operating conditions, the sample must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

Note

In the Armv7 PC Sample-based Profiling Extension, an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. From the introduction of the Armv8 PC Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

- Controlling the PC Sample-based Profiling Extension.
- Registers implemented by the PC Sample-based Profiling Extension on page H7-10353.
- Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-10354.
- Pseudocode description of PC Sample-based Profiling on page H7-10354.

H7.1.1 Controlling the PC Sample-based Profiling Extension

PC Sample-based Profiling is controlled by the IMPLEMENTATION DEFINED authentication interface ExternalNoninvasiveDebugEnabled().

PC Sample-based Profiling is prohibited unless both:

- It is allowed by the IMPLEMENTATION DEFINED authentication interface ExternalNoninvasiveDebugEnabled().
- At least one of the following applies:
  - The PE is executing in Non-secure state.
  - The PE is executing in Secure state, and non-invasive debug is allowed by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().
H7.1 About the PC Sample-based Profiling Extension

The state of the IMPLEMENTATION DEFINED authentication interface is visible through DBGAUTHSTATUS_EL1. See Recommended authentication interface on page K6-11687.

H7.1.2 Registers implemented by the PC Sample-based Profiling Extension

The options for implementing the PC Sample-based Profiling extension are:

- The extension is implemented in the external debug register space. EDDEVID.PCSample and identifies the implemented level of profiling, and EDDEVID1.PCSROffset also indicates that this option is implemented. From Armv8.2 this option is not permitted.
- FEAT_PCSRv8p2 is implemented, meaning the PC Sample-based Profiling extension is implemented in the Performance Monitors memory-mapped register space. PMDEVID.PCSample identifies the implemented level of profiling.

If PC Sample-based Profiling is implemented in the external debug register space:

- The following external debug registers can be implemented:
  - EDCIDSR.
  - EDPCSR.
  - EDVIDSR.
  - DBGAUTHSTATUS_EL1.
  - PMCCIDSR.
  - PMPCSR.
  - PMVIDSR.
  - PMVCIDSR.

See External debug interface registers on page H8-10368.

- If FEAT_VHE is implemented, EDSCR.SC2 controls what PC Sample-based Profiling samples.

If FEAT_PCSRv8p2 is implemented and the 64-bit external PMU programmers’ model extension is not implemented, the following registers can be implemented in the Performance Monitors memory-mapped register space:

- PMCID1SR and PMCID2SR.
- PMPCSR.
- PMVIDSR.

When the 64-bit external PMU programmers’ model extension is implemented, these registers are:

- PMCCIDSR.
- PMPCSR.
- PMVIDSR.
- PMVCIDSR.

See Performance Monitors external register views on page I5-10748.

If the PC Sample-based Profiling Extension is implemented with FEAT_PCSRv8p2 but the Performance Monitors Extension is not implemented, then the PC Sample-based Profiling Extension is implemented in its own memory-mapped register space, within the area that is reserved for the Performance Monitors, see Table H7-1 on page H7-10353. If CoreSight compliance is required:

- The management registers are defined as in Table K6-3 on page K6-11688.
- The support for PC Sample-based profiling is defined in the following registers:
  - PMDEVTYPEMAJOR has the value 0x0.
  - PMDEVACHR.ARCHID has the value 0x0A10.

H7.1 About the PC Sample-based Profiling Extension

H7.1.3 Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN

The architecture permits IMPLEMENTATION DEFINED extensions to external debug to define mechanisms that make the values of the PC Sample-based profiling registers UNKNOWN. However, it requires that any such mechanism is disabled by default. This means that powerup or a hard reset of the PE must leave the PE in a state where the PC Sample-based Profiling Extension, if implemented, exhibits its architecturally-defined behavior.

--- Note ---
A mechanism that, when enabled, makes the PC Sample-based profiling registers UNKNOWN might use other sample-based profiling events that are appropriate for a use that is independent of PC Sample-based Profiling.

If no branch instruction has been retired since the PE left Debug state, reset state, or a state where PC Sample-based profiling is prohibited, the sampled value is UNKNOWN. If a branch instruction has been retired but this is the first time the PMPCSR or EDPCSR is read since the PE left reset state, the sampled value is permitted but not required to return the value 0xFFFFFFF.

When FEAT_MOPS and FEAT_PCSRv8p2 are not implemented, if no branch instruction has been retired since the last read of PMPCSR[31:0], then the value of PMPCSR[31:0] is UNKNOWN.

H7.1.4 Pseudocode description of PC Sample-based Profiling

When PC Sample-based Profiling is implemented but not with FEAT_PCSRv8p2, the functionality is described by the pseudocode functions:

- CreatePCSample(), which populates a variable of type PCSample.
- EDPCSRlo[()], which writes a PC sample to the EDPCSR and associated registers.

When FEAT_PCSRv8p2 is implemented, the functionality is described by the pseudocode functions:

- CreatePCSample(), which populates a variable of type PCSample.
- PMPCSR[()], which writes a PC Sample to the PMPCSR and associated registers.

Chapter H8
About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- Relationship between external debug and System registers on page H8-10356.
- Endianness and supported access sizes on page H8-10357.
- Synchronization of changes to the external debug registers on page H8-10358.
- Memory-mapped accesses to the external debug interface on page H8-10362.
- External debug interface register access permissions on page H8-10364.
- External debug interface registers on page H8-10368.
- Cross-trigger interface registers on page H8-10375.
- External debug register resets on page H8-10378.

Note
Where necessary, Table K17-1 on page K17-11836 disambiguates the general register references used in this chapter.
H8.1 Relationship between external debug and System registers

Table H8-1 on page H8-10356 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

a. This is a word of a 64-bit register.

In addition:
- EDSCR.TXfull, RXfull are read-only aliases for DCCSR.TXfull, RXfull.
- EDPRCR.CORENPDRQ is a read/write alias for DBGPRCR.CORENPDRQ.
- EDPRSR.OSLK is a read-only alias for OSLR.OSLK.
- If the FEAT_DoubleLock is implemented, EDPRSR.DLK is a read-only function of OSDLR.DLK.
H8.2 Endianness and supported access sizes

The debug registers, Performance Monitors registers, and CTI registers are implemented as memory-mapped peripherals. The Arm architecture requires memory-mapped peripherals to be little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitors registers, and CTI registers, implementations must:

• Comply with the requirements of Supported access sizes on page I1-10716.
• Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if all components with direct memory access to the memory-mapped peripheral support making 64-bit accesses.

Note

These requirements mean that a system implementing the debug registers using a 32-bit bus, such as a AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADIv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.
H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- Synchronization and debug exceptions on page D2-4755 for exceptions taken from AArch64 state.
- Synchronization and debug exceptions on page G2-9100 for exceptions taken from AArch32 state.
- Synchronization and Halting debug events on page H3-10295.
- Synchronization of DCC and ITR accesses on page H4-10309.

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

Note

Synchronization requirements for AArch64 System registers on page D17-5547 and Synchronization of changes to AArch32 System registers on page G8-9326 define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

For general information about synchronization, access completion, ordering, and observability, see Synchronization of memory-mapped registers on page I1-10718.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, and DBGWVR<n>_EL1, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Synchronization of DCC and ITR accesses on page H4-10309 describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the Requester of the authentication interface. See Synchronization and the authentication interface on page H8-10359.

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSBB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

Note

For an external Debug Access Port, access completion is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an ISB instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to EDITR.

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, DBGBCR<n>_EL1 and DBGBVR<n>_EL1.
- The watchpoint registers, DBGWCR<n>_EL1 and DBGWVR<n>_EL1.
This guarantee applies only to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example EDSCR, or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

Note
This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in Examples of the synchronization of changes to the external debug registers.

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and System register access include DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, PMCR_EL0;{C,P}, PMOVSET_EL0, PMOVSCLR_EL0, PMCNTENSEL0, PMCNTENCCLR_EL0, PMINTENSEL1, PMINTENCLR_EL1, and PMSWINC_EL0. This last register is OPTIONAL and deprecated in the external debug interface.

H8.3.1 Synchronization and the authentication interface
Changes to the authentication interface are indirect writes to the state of the PE by the Requester of the authentication interface.

For an external debug interface read of any Authentication Status register, or an indirect read of the authentication interface made in determining the response to a subsequent external debug interface access, a change on the authentication interface must be observable following a subsequent explicit Context synchronization event, and:

• It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable in finite time.
• It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable following an entry to Debug state.

For a System register read of DBGAUTHSTATUS_EL1, a change on the authentication interface is guaranteed to be observable only after a Context synchronization event.

Note
• In some systems, the authentication interface is fixed by configuration or is changed under the control of software. These systems can require explicit synchronization for any change to the authentication interface.
• In other systems, the authentication interface is controlled dynamically by an external agent. In these systems, it is desirable that changes to the authentication interface do not require explicit synchronization by software executing on the PE to be observable by subsequent external debug interface accesses, and are either observable in finite time or are synchronized by entry to Debug state. Otherwise, there are scenarios where a debugger is not able to halt and debug the system.

H8.3.2 Examples of the synchronization of changes to the external debug registers
Example H8-1, Example H8-2 on page H8-10360, and Example H8-3 on page H8-10360 show the synchronization of changes to the external debug registers.

Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes
Initially DBGVR<n>_EL1 is 0x8000 and DBGBCR<n>_EL1 is 0x0181. This means that a breakpoint is enabled on the halfword T32 instruction at address 0x8000.
A sequence of external writes occurs in the following order:
1. $0x0000$ is written to $\text{DBGBCR}<n>_\text{EL1}$, disabling the breakpoint.
2. $0x9000$ is written to $\text{DBGBVR}<n>_\text{EL1}[31:0]$.
3. $0x061$ is written to $\text{DBGBCR}<n>_\text{EL1}$, enabling a breakpoint on the halfword at address $0x9002$.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address $0x8002$ and $0x9000$.

Similarly a breakpoint or watchpoint must be disabled:
• If both halves of a 64-bit address have to be updated.
• If any of the $\text{DBGBCR}<n>_\text{EL1}$ or $\text{DBGWCR}<n>_\text{EL1}$ fields are modified at the same time as updating the address.

---

### Example H8-2 Simultaneous accesses to DTR registers

Initially $\text{EDSCR.}\{\text{TXfull, TXU, ERR}\}$ are 0. Then:
• $0x0CDA7A$ is directly written to $\text{DBGDTRTX}_\text{EL0}$ by an MSR instruction.
• $\text{DBGDTRTX}_\text{EL0}$ is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of $0x0CDA7A$ to $\text{DBGDTRTX}_\text{EL0}$ is handled first, then:
• The external debug interface read of $\text{DBGDTRTX}_\text{EL0}$ clears $\text{EDSCR.TXfull}$ to 0.
• $\text{EDSCR.}\{\text{TXU, ERR}\}$ are unchanged.
• The external debug interface read returns $0x0CDA7A$.

If the indirect read of $\text{DBGDTRTX}_\text{EL0}$ by the external debug interface is handled first, then:
• The external debug interface read of $\text{DBGDTRTX}_\text{EL0}$ causes an underrun and as a result $\text{EDSCR.}\{\text{TXU, ERR}\}$ are both set to 1.
• The external debug interface returns an \text{UNKNOWN} value.
• Writing $0x0CDA7A$ to $\text{DBGDTRTX}_\text{EL0}$ sets $\text{DTRTX}$ to $0x0CDA7A$ and $\text{EDSCR.TXfull}$ to 1.

---

### Example H8-3 Simultaneous writes to CLAIM registers

Initially all CLAIM tag bits are 0. Then:
• $0x01$ is written to $\text{DBGCLAIMSET}_\text{EL1}$ by a direct write, followed by an explicit \text{Context synchronization event}.
• $0x02$ is written to $\text{DBGCLAIMSET}_\text{EL1}$ by an external write.

These events might happen at the same time and in either order.

After this:
• $\text{DBGCLAIMCLR}_\text{EL1}$ is read by a direct read.
• $\text{DBGCLAIMCLR}_\text{EL1}$ is read by an external read.

In this case, a direct read can return either $0x01$ or $0x03$, and the external read can return either $0x02$ or $0x03$.

The only permitted final result for the CLAIM tags is the value $0x03$, because this would be the result regardless of whether $0x01$ or $0x02$ is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See \text{Synchronization requirements for AArch64 System registers} on page D17-5547.

It is not possible for a direct read to return $0x01$ and the external read to return $0x02$, because the writes to $\text{DBGCLAIMCLR}_\text{EL1}$ are serialized.
In the following scenario, there is only one permitted result. Both observers observe the value 0x03, and then, at the same time, two writes occur:

- 0x04 is written to DBGCLAIMSET_EL1 by a direct write, followed by an explicit *Context synchronization event*.
- 0x01 is written to DBGCLAIMCLR_EL1 by an external write.

In this case, the only permitted final result for the CLAIM tags is the value 0x06.
H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL. When memory-mapped access to the external debug interface is supported, the external debug interface is accessed as a little-endian memory-mapped peripheral.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component.

The Software Lock is OPTIONAL and deprecated. If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented. If it is not implemented, the behavior is as if it is unlocked. The Software Locks are controlled by EDLSR and EDLAR, PMLSR and PMLAR, and CTILSR and CTILAR. See Management registers and CoreSight compliance on page K6-11688.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components in the Core power domain.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

Note: The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in Armv7. In particular:

- The memory map is different.
- Memory-mapped accesses do not behave differently to Debug Access Port accesses when OSLSR.OSLK == 1, meaning that the OS Lock is locked.

The following sections give more information about these memory-mapped accesses:

- Register access permissions for memory-mapped accesses.
- Synchronization of memory-mapped accesses to external debug registers on page H8-10363.

See also Supported access sizes on page I1-10716.

H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If FEAT_Debugv8p4 is implemented, the Secure view of a debug component is mapped into Secure physical memory and the Non-secure view is mapped into Non-secure physical memory.

If FEAT_Debugv8p4 is implemented, the access permissions are different in each Security state, but Secure and Non-secure views of the debug components are identical. Arm recommends the views are located at the same address in the Secure and Non-secure physical address maps.

If memory-mapped accesses are made through an ADIv5 interface, the Debug Access Port can block the access using DBGSWENABLE. This is outside the scope of the Arm architecture. See Arm® Debug Interface Architecture Specification ADIv5.0 to ADIv5.2.

Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and EDLSR.SLK, PMLSR.SLK, or CTILSR.SLK is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
  - Read/write (RW) registers become read-only, writes ignored (RO/WI).
  - Write-only (WO) registers become writes ignored (WI).
- Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.
• Writes to EDLAR, PMLAR, and CTILAR are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if EDLSR.SLK is set to 1:
• EDSCR.\{TXfull, TXU, ERR\} are unchanged by a memory-mapped read from DBGDTRTX_EL0.
• EDSCR.\{RXfull, RXO, ERR\} are unchanged by a memory-mapped write to DBGDTRRX_EL0 that is ignored.
• EDSCR.\{ITE, ITO, ERR\} are unchanged by a memory-mapped write to EDITR that is ignored.
• OSLSR.OSLK is unchanged by a memory-mapped write to OSLAR_EL1 that is ignored.
• EDPCSR[63:32], EDCIDSR, and EDVIDSR are unchanged by a memory-mapped read from EDPCSR[31:0].

--- Note ---
Updating EDVIDSR, EDCIDSR, and EDPCSRhi are side-effects of reading EDPCSRlo, such that these registers contain the matching context for EDPCSRlo. The process that updates EDPCSRlo with PC samples is not a side-effect of the access. Reads of EDPCSRlo made when the Software Lock is locked can be used to profile software.

--- Note ---
Updating PMVDSR, PMCID1SR/PMCID2SR, and PMVIDSR are unchanged by a memory-mapped read from PMPCSR[31:0].

--- Note ---
Updating PMVDSR, PMCID1SR/PMCID2SR, and PMPCSR[31:0] are side-effects of reading PMPCSR[63:32], such that these registers contain the matching context for PMPCSR[63:32]. The process that updates PMPCSR[63:32] with PC samples is not a side-effect of the access. Reads of PMPCSR[63:32] made when the Software Lock is locked can be used to profile software.

• EDPRSR.\{SDR, SPMAD, SDAD, SR, SPD\} are unchanged by a memory-mapped read from EDPRSR.
• EDPRSR.SDAD is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the EDAD field.
• The CLAIM tags are unchanged by memory-mapped writes to DBGCLAIMSET_EL1 and DBGCLAIMCLR_EL1 which are ignored.

Similarly, if PMLSR.SLK is set to 1, then EDPRSR.SPMAD is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the EPMAD field.

**Behavior of a not permitted memory-mapped access**

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

Arm recommends that the error is returned as either:
• A synchronous external Data Abort.
• An SError interrupt.

**H8.4.2 Synchronization of memory-mapped accesses to external debug registers**

The synchronization requirements for memory-mapped accesses to the external debug interface is described in *Synchronization of changes to the external debug registers* on page H8-10358 and *Synchronization of memory-mapped registers* on page I1-10718.

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.
H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- OSLSR.OSLK == 1. The OS Lock is locked.
- FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. The OS Double Lock is locked.
- The access is disabled by either the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For more information, see External debug interface register access permissions summary on page H8-10365.

H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case, all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- OSLSR.OSLK == 1, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.
- FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. This means that the OS Double Lock is locked. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

If FEAT_DoubleLock is not implemented, the hardware must provide another method to safely remove Core power.

The OS Lock condition does not apply to the following debug registers:

- OSLAR_EL1. This means that an external debugger can override this lock.
- EDESR. This means that an external debugger can program a debug event for when software unlocks the OS Lock. See OS Unlock Catch debug event on page H3-10292.
- The ID registers that describe the PE to the debugger.

See also Debug registers to save over powerdown on page H6-10343.

H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then SDCR provides additional external access controls for those registers.

The disable applies to:

- The DBGVR<el1>, DBGBCR<el1>, DBGWVR<el1>, and DBGWCR<el1> registers.
- From Armv8.2, the OSLAR_EL1 register.

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether the disable applies to OSLAR_EL1.

If FEAT_Debugv8p4 is not implemented, the external debug interface cannot access these registers if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the PE behaves as if the Security state is Secure.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is implemented and SDCR.EDAD == 1.

If FEAT_Debugv8p4 is implemented, Non-secure accesses from the external debug interface to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.
• EL3 is implemented and SDCR.EDAD == 1.

The AllowExternalDebugAccess() pseudocode function describes these accessibility rules.

PEs might also provide an OPTIONAL external debug interface to the Performance Monitor registers. The authentication interface and SDCR provide similar external access disable controls for those registers.

If FEAT_Debugv8p4 is not implemented, the external debug interface cannot access the Performance Monitor registers if any of the following are true:
• ExternalNoninvasiveDebugEnabled() == FALSE.
• ExternalSecureNoninvasiveDebugEnabled() == FALSE, EL3 is not implemented and the PE behaves as if the Security state is Secure.
• ExternalSecureNoninvasiveDebugEnabled() == FALSE, EL3 is implemented and SDCR.EPMAD == 1.

Note
• Arm recommends that Secure software that is not making use of debug hardware does not lock out the external debug interface.
• The Arm architecture does not provide the equivalent control over access to Trace extension registers, which means if FEAT_Debugv8p4 is implemented, the Non-secure and Secure views are identical.

If FEAT_Debugv8p4 is implemented, Non-secure accesses from the external debug interface to these registers are not permitted if any of the following are true:
• EL3 is not implemented and the PE behaves as if the Security state is Secure.
• EL3 is implemented and SDCR.EPMAD == 1.

The AllowExternalPMUAccess() pseudocode function describes these accessibility rules.

H8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIv5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in EDPRSR is indirectly written to 1 as a side-effect of the access:
• For a debug register access when AllowExternalDebugAccess() == FALSE, EDPRSR.SDAD is indirectly written to 1.
• For Performance Monitor register access when AllowExternalPMUAccess() == FALSE, EDPRSR.SPMAD is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see Register access permissions for memory-mapped accesses on page H8-10362.

If no error is returned, or the error is returned because of a higher priority error condition, the flag in EDPRSR is unchanged.

See also Behavior of a not permitted memory-mapped access on page H8-10363.

For more information, see Arm® Debug Interface Architecture Specification.

H8.5.4 External debug interface register access permissions summary

For accesses to:
• IMPLEMENTATION DEFINED registers, see IMPLEMENTATION DEFINED registers on page H8-10366.
• OPTIONAL registers for CoreSight compliance, see Management registers and CoreSight compliance on page K6-11688.
• Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see Reserved and unallocated registers on page H8-10366.
For all other external debug interface, CTI, and Performance Monitor registers, Table H8-3 on page H8-10371, Table H8-4 on page H8-10373, Table H8-6 on page H8-10376 and Table I3-2 on page I3-10738, show the response of the PE to accesses by the external debug interface.

H8.5.5 IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, register access permissions for IMPLEMENTATION DEFINED registers are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers. For more information, see Register access permissions for memory-mapped accesses on page H8-10362.

If FEAT_DoPD is not implemented, the power domain of these registers in which these registers are implemented is also IMPLEMENTATION DEFINED. The registers must apply the constraint that if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects.

If FEAT_DoPD is implemented, then:

- For debug registers and Performance Monitors registers, IMPLEMENTATION DEFINED registers are implemented in the Core power domain. Accesses return an error when the Core power domain is off or in a low-power state.
- For CTI registers, IMPLEMENTATION DEFINED registers are implemented in the Debug power domain.

H8.5.6 Reserved and unallocated registers

The default access requirements for reserved and unallocated registers are described in Access requirements for reserved and unallocated registers on page I1-10720.

Note

Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- All reserved CTI registers.
- For the debug registers, and Performance Monitors registers, if the implementation is CoreSight architecture compliant, and either FEAT_DoPD is not implemented or the Core power domain is on, all reserved registers in the range 0xF00 - 0xFFC. See Management register access permissions on page K6-11689.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.

2. For reserved debug registers and Performance Monitors registers, if FEAT_DoPD is implemented, and the Core power domain is off or in a low-power state, the response is an error. Otherwise, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:

   - Off: The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.
   - DLK: FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. The OS Double Lock is locked.
   - OSLK: OSLSR.OSLK == 1. The OS Lock is locked.

3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

   - EDAD: AllowExternalDebugAccess() == FALSE. External debug is disabled.

Note

See also Behavior of a not permitted access on page H8-10365.
4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0xEFC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

   EPMAD AllowExternalPMUAccess() == FALSE. External Performance Monitor access is disabled.

   **Note**

   See also *Behavior of a not permitted access* on page H8-10365.

5. For reads of WO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a write to the location to return an error.

6. For writes of RO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a read to the location to return an error.

7. For reads and writes of locations for features that are not implemented, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires an access to the location to return an error if the feature is implemented.
## H8.6 External debug interface registers

The external debug interface register map is described by:
- *External debug interface register map on page H8-10368.*
- *Cross-trigger interface registers on page H8-10375.*
- *Performance Monitors external register views on page I5-10748.*

About the External Debug Registers

H8.6 External debug interface registers

DBGBVR<n>_EL1 and DBGWVR<n>_EL1 are 64-bit registers mapped to pairs of 32-bit locations. Doubleword accesses to these registers are not guaranteed to be 64-bit single copy atomic. Software must ensure a breakpoint or watchpoint is disabled before altering the value registers. See Endianness and supported access sizes on page H8-10357 for more information.

H8.6.1 Access permissions for the External debug interface registers

Table H8-3 on page H8-10371 and Table H8-4 on page H8-10373 show the access permissions for the external debug interface registers in an Arm A-profile Debug implementation. The terms are defined as follows:

<table>
<thead>
<tr>
<th>Domain</th>
<th>Conditions</th>
<th>Description</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed, and if FEAT_DoPD is not implemented, EDPRSR.PU will read as 0.</td>
<td>The Core power domain is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.</td>
<td>RO</td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>If FEAT_DoPD is implemented, most External debug interface registers are in the Core power domain, as shown in Table H8-3 on page H8-10371. If FEAT_DoPD is not implemented, most of the registers are in the Debug Power Domain, as shown in Table H8-4 on page H8-10373.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>To determine the access permissions for a register, read these columns from left to right, and stop at first column that lists the condition as being true.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DLK</td>
<td>FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. The OS Double Lock is locked. If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented and so Table H8-3 on page H8-10371 does not include this column.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>OSLK</td>
<td>OSLSR.OSLK == 1. The OS Lock is locked.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EDAD</td>
<td>AllowExternalDebugAccess() == FALSE. External debug access is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure accesses to the register. See also Behavior of a not permitted access on page H8-10365.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EPMAD</td>
<td>AllowExternalPMUAccess() == FALSE. Access to the external Performance Monitors is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure accesses to the register. See also Behavior of a not permitted access on page H8-10365.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SLK</td>
<td>The Software Lock is implemented and SoftwareLockStatus() == TRUE. This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See Register access</td>
<td></td>
</tr>
</tbody>
</table>

Table H8-2 External debug interface register map (continued)

Offset | Name | Description | Access |
--------|------|-------------|--------|
0xFF4   | EDCIDR1 | External Debug Component Identification Register 1 | RO |
0xFF8   | EDCIDR2 | External Debug Component Identification Register 2 | RO |
0xFFC   | EDCIDR3 | External Debug Component Identification Register 3 | RO |
permissions for memory-mapped accesses on page H8-10362. If FEAT_DoPD is implemented, the Software Lock is not locked or not implemented, this column is ignored.

Default  This provides the default access permissions, if there are no conditions that prevent access to the register.

The access permissions are:

- This means that the default access permission applies. See the Default column, or the SLK column, if applicable.

RO  This means that the register or field is read-only, and:

  - Unless the register description states otherwise, a RO field in an RW register ignores writes.
  - Where the SLK control makes a RW register RO, the register ignores writes.

RW  This means that the register or field is read/write. Individual fields within the register might be RO or WO. See the relevant register description for details.

RC  This means that a read of the register bit clears the field to 0.

WO  This means that the register or field is write-only. Unless the register description states otherwise, a WO field in a RW register returns an UNKNOWN value on a read of the register.

WI  This means that the register or field ignores writes.

IMP DEF  This means that the access permissions are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See Register access permissions for memory-mapped accesses on page H8-10362.

For the reset values for the external debug interface registers, see Table H8-7 on page H8-10378.

\(^a\) When embroidery is used, any access to this register causes a debug exception.

\(^b\) When embroidery is used, any access to this register changes the value of SLK.

\(^c\) A register with the Core and Debug domain is readable by the core and debug interface.

\(^d\) An access to the register is allowed when the corresponding access control bit is enabled.

\(^e\) Access control to the register is disabled.

- a. Implemented only if the PC Sample-based Profiling Extension is implemented.
- b. If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether an error is returned. See External access disabled on page H8-10364. If no error is returned, the access is permitted.
- c. Some bits are in the Debug power domain and some bits are in the Core power domain. See register field descriptions for information.
- d. Implemented breakpoints and watchpoints only. \( n \) is the breakpoint or watchpoint number.
- e. It is IMPLEMENTATION DEFINED whether an error is returned. See External debug over powerdown and locks on page H8-10364. If no error is returned, the access is permitted.
H8.7 Cross-trigger interface registers

The Embedded Cross-Trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the CTIDEV AFF0 or CTIDEV AFF1 registers it must be located 64KB above the debug registers in the external debug interface.

When FEAT_Debugv8p4 is implemented, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

Table H8-5 on page H8-10375 shows the CTI register map.

For the reset values of the CTI registers, see Table H8-8 on page H8-10380.
H8.8 External debug register resets

Each register or field has a defined reset domain:
- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.
- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.
- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

A reset might change the value of a register. Specific rules apply to the observability of registers in the External Debug reset domain by indirect reads from the Core power domain when an External Debug reset is asserted without a coincident Cold reset. For more information, see Synchronization of changes to the external debug registers on page H8-10358.

Table H8-2 on page H8-10368 and Table H8-5 on page H8-10375 show the external debug register and CTI register resets. For other debug registers, see Management register resets on page K6-11695.

Note

By reference to Figure H6-1 on page H6-10348 the power domain can be deduced from the reset domain. Table K6-9 on page K6-11695 also shows reset power domains.

Table H8-2 on page H8-10368 and Table H8-5 on page H8-10375 do not include:
- Read-only identification registers, such as Processor ID Registers and PMCFGR, that have a fixed value from reset.
- Read-only status registers, such as EDSCR.RW, that are evaluated each time the register is read and that have no meaningful reset value.
- Write-only registers, such as EDRCR, that only have an effect on writes, and have no meaningful reset value.
- Read/write registers, such as breakpoint and watchpoint registers, and EDPRCR.CORENPDRQ, that alias other registers. The reset values are described by the descriptions of those other registers.
- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value that can be UNKNOWN. The register is in the specified reset domain.

Note

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

</tbody>
</table>

a. If FEAT_DoPD is not implemented, the powerup request is the EDPRCR.COREPURQ control bit.

b. If FEAT_DoPD is not implemented, on a Cold reset into AArch64 state, DBGPRCR_EL1.CORENPDRQ resets to the value of EDPRCR.COREPURQ. On a Cold reset into AArch32 state, DBGPRCR.CORENPDRQ resets to the value of EDPRCR.COREPURQ. If an External Debug reset and a Cold reset coincide, both EDPRCR.COREPURQ and the CORENPDRQ field of the appropriate System register are reset to 0.

Table H8-5 on page H8-10375 shows the reset values for the CTI registers

Chapter H9
External Debug Register Descriptions

This chapter provides a description of the external debug registers. It contains the following sections:

• About the debug registers on page H9-10382.
• External debug registers on page H9-10383.
• Cross-Trigger Interface registers on page H9-10660.
H9.1 About the debug registers

The following sections describe the registers that are accessible through the external debug interface:

- External debug registers on page H9-10383.
- Cross-Trigger Interface registers on page H9-10660.
H9.2  External debug registers

This section describes the debug registers that are accessible through the external debug interface and are used for external debug.
H9.2.1 **DBGAUTHSTATUS_EL1, Debug Authentication Status register**

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configurations**

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:28</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>27:26</td>
<td>RTNID, Root non-invasive debug.</td>
</tr>
<tr>
<td>25:24</td>
<td>RTID, Root invasive debug.</td>
</tr>
<tr>
<td>15:14</td>
<td>RLNID, Realm non-invasive debug.</td>
</tr>
<tr>
<td>13:12</td>
<td>RLID, Realm invasive debug.</td>
</tr>
<tr>
<td>8:0</td>
<td>NSID</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**RTNID, bits [27:26]**

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

**RTID, bits [25:24]**

Root invasive debug.

- **0b00**: Not implemented.
- **0b10**: Implemented and disabled.
  
  ```
  static bool ExternalRootInvasiveDebugEnabled() { return false; }
  ```

- **0b11**: Implemented and enabled.
  
  ```
  static bool ExternalRootInvasiveDebugEnabled() { return true; }
  ```

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

**Bits [23:16]**

Reserved, RES0.

**RLNID, bits [15:14]**

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

**RLID, bits [13:12]**

Realm invasive debug.

- **0b00**: Not implemented.
0b10  Implemented and disabled.
     ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled.
     ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

**Bits [11:8]**

Reserved, RES0.

**SNID, bits [7:6]**

- **When FEAT_Debugv8p4 is implemented:**
  - Secure non-invasive debug.
  - This field has the same value as DBGAUTHSTATUS_EL1.SID.
- **Otherwise:**
  - Secure non-invasive debug.
  
    - 0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
    - 0b10  Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
    - 0b11  Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

**SID, bits [5:4]**

- Secure invasive debug.
  
    - 0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
    - 0b10  Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
    - 0b11  Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

**NSNID, bits [3:2]**

- **When FEAT_Debugv8p4 is implemented:**
  - Non-secure non-invasive debug.
    
      - 0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
      - 0b11  Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.
  
     If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.
  
     All other values are reserved.
- **Otherwise:**
  - Non-secure non-invasive debug.
    
      - 0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
      - 0b10  Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
      - 0b11  Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

**NSID, bits [1:0]**

- Non-secure invasive debug.
  
    - 0b00  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
    - 0b10  Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
    - 0b11  Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.
All other values are reserved.

**Accessing the DBGAUTHSTATUS_EL1:**

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB8</td>
<td>DBGAUTHSTATUS_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

**Configurations**

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

DBGBCR<n>_EL1 is a 32-bit register.

**Field descriptions**

| 31 | 28 | 23 | 20 | 19 | 16 | 15 | 14 | 13 | 12 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BT | LBN | SSC | RES0 | BAS | RES0 | PMC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:

- **0b0000**: Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
- **0b0001**: As 0b0000 but linked to a Context matching breakpoint.
- **0b0010**: Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.
- **0b0011**: As 0b0010, with linking enabled.
- **0b0100**: Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped.
- **0b0101**: As 0b0100, but linked to a Context matching breakpoint.
- **0b0110**: Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.
- **0b0111**: As 0b0110, with linking enabled.
- **0b1000**: Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an **UNKNOWN** value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see **Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values** on page D2-4722.

For more information on the operation of the SSC, HMC, and PMC fields, see **Execution conditions for which a breakpoint generates Breakpoint exceptions** on page D2-4717.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see **DBGBCR<n>_EL1.SSC description**.

For more information on the operation of the SSC, HMC, and PMC fields, see **Execution conditions for which a breakpoint generates Breakpoint exceptions** on page D2-4717.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [12:9]**

Reserved, **RES0**.
BAS, bits [8:5]

When AArch32 is supported:
Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.
The permitted values depend on the breakpoint type.
For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;(n)&gt;_EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;(n)&gt;_EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;(n)&gt;_EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved.
For more information, see Using the BAS field in Address Match breakpoints on page G2-9067.
For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;(n)&gt;_EL1</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;(n)&gt;_EL1 + 2</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;(n)&gt;_EL1</td>
<td>Use for stepping A64 and A32 instructions</td>
</tr>
</tbody>
</table>

For more information, see Using the BAS field in Address Match breakpoints on page G2-9067.
For Context matching breakpoints, this field is RES1 and ignored.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES1.

Bits [4:3]
Reserved, RES0.

PMC, bits [2:1]
Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the \{HMC, SSC, PMC\} fields. For more information see the DBGBCR<\(n\)>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-4717.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]
Enable breakpoint DBGBVR<\(n\)>_EL1. Possible values are:
0b0 Breakpoint disabled.
0b1 Breakpoint enabled.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DBGBCR<n>_EL1:**

_____ Note _______
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new
definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x408 + (16 * n)</td>
<td>DBGBCR&lt;n&gt;_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
• Otherwise accesses to this register generate an error response.
H9.2.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

**Configurations**

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:0].

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

If the breakpoint is context-aware and EL2 is implemented then External register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register DBGBXVR<n>. Otherwise, there is no External register access to DBGBVR<n>_EL1[63:32] from AArch32 state.

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is 0b000x, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

DBGBVR<n>_EL1 is a 64-bit register.

**Field descriptions**

*When DBGBCR<n>_EL1.BT == 0b000x:*

<table>
<thead>
<tr>
<th>63</th>
<th>53</th>
<th>49</th>
<th>48</th>
<th>32</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [52:49]</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA[48:2]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>30</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

VA[52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

• This field contains bits[48:2] of the address for comparison.

• When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), EL2 is using AArch64, HCR_EL2.E2H is 1, and either:

• The PE is executing at EL2.

• HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

• CONTEXTIDR when the PE is executing at AArch32.

• CONTEXTIDR_EL1 when the PE is executing at AArch64.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.
When DBGBCR<\(n\)_EL1.BT == 0b011x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

Bits [63:32]  
Reserved, RES0.

ContextID, bits [31:0]  
Context ID value for comparison against CONTEXTIDR_EL1.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<\(n\)_EL1.BT == 0b100x and EL2 is implemented:

Bits [63:48]  
Reserved, RES0.

VMID[15:8], bits [47:40]  
When FEAT_VHE is implemented and VTCR_EL2.VS == 1:  
Extension to VMID[7:0]. For more information, see DBGBVR<\(n\)_EL1.VMID[7:0].
If EL2 is using AArch32, this field is RES0.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

VMID[7:0], bits [39:32]  
VMID value for comparison.
The VMID is 8 bits when any of the following are true:
• EL2 is using AArch32.
• VTCR_EL2.VS is 0.
• FEAT_VMID16 is not implemented.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]  
Reserved, RES0.
When DBGBCR<{}>_EL1.BT == 0b101x and EL2 is implemented:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47-40</td>
<td>VMID[15:8]</td>
</tr>
<tr>
<td>39-32</td>
<td>VMID[7:0]</td>
</tr>
<tr>
<td>31-0</td>
<td>ContextID</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBCR<{}>_EL1.VMID[7:0].
If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.
The reset behavior of this field is:
  • On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.
The VMID is 8 bits when any of the following are true:
• EL2 is using AArch32.
• VTCR_EL2.VS is 0.
• FEAT_VMID16 is not implemented.
The reset behavior of this field is:
  • On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.
The reset behavior of this field is:
  • On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<{}>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>ContextID2</td>
</tr>
<tr>
<td>31-0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.
The reset behavior of this field is:
  • On a Cold reset, this field resets to an architecturally UNKNOWN value.
Bits [31:0]

Reserved, RES0.

*When DBGBCRₙ_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented)*:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextID2</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextID</td>
<td></td>
</tr>
</tbody>
</table>

**ContextID2, bits [63:32]**

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

### Accessing the DBGBVRₙ_EL1:

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVRₙ_EL1[63:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x400 + (16 * n)</td>
<td>DBGBVRₙ_EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.4  DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software. Used in conjunction with the DBGCLAIMSET_EL1 register.

Configurations

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/WI</td>
<td>CLAIM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing the DBGCLAIMCLR_EL1:

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA4</td>
<td>DBGCLAIMCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
• When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are RW.
• Otherwise accesses to this register generate an error response.
H9.2.5  DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

--- **Note** ---

CLAIM tags are typically used for communication between the debugger and target software.

---

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

**Configurations**

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RAZ/WI</td>
</tr>
<tr>
<td>8</td>
<td>Claim, bits [7:0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/WI.

**CLAIM, bits [7:0]**

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

**Accessing the DBGCLAIMSET_EL1:**

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA0</td>
<td>DBGCLAIMSET_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.

• Otherwise accesses to this register generate an error response.
H9.2.6  DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configurations**

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain.

**Attributes**

DBGDTRRX_EL0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Update DTRRX</th>
</tr>
</thead>
</table>

**Bits [31:0]**

Update DTRRX.

Writes to this register:
- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:
- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRRX_EL0:**

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.
DBGDTRRX_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x80</td>
<td>DBGDTRRX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.7 DBGDTTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configurations**

External register DBGDTTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

External register DBGDTTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

DBGDTTX_EL0 is in the Core power domain.

**Attributes**

DBGDTTX_EL0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Return DTRTX</td>
</tr>
</tbody>
</table>

- **Bits [31:0]**
  - Return DTRTX.
  - Reads of this register:
    - If TXfull is set to 1, return the last value written to DTRTX.
    - If TXfull is set to 0, return an UNKNOWN value.
  - After the read, TXfull is cleared to 0.
  - Writes to this register:
    - If TXfull is set to 1, set DTRTX to UNKNOWN.
    - If TXfull is set to 0, update the value in DTRTX.
  - After the write, TXfull remains unchanged.

- For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

- The reset behavior of this field is:
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTTX_EL0:**

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.
DBGDTRTX_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x08C</td>
<td>DBGDTRTX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.8  **DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15**

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Configurations**

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWCR<n>_EL1 is a 32-bit register.

**Field descriptions**

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

- 0b00000  No mask.
- 0b00001  Reserved.
- 0b00010  Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b0000011 masking 3 address bits (0x00000007 mask for address) to 0b1111111 masking 31 address bits (0xFFFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:21]**

Reserved, RES0.
WT, bit [20]
Watchpoint type. Possible values are:
0b0 Unlinked data address match.
0b1 Linked data address match.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]
Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]
Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.
For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-4728.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]
Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.
For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-4728.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]
Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxxxxx1</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1</td>
</tr>
<tr>
<td>xxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 1</td>
</tr>
<tr>
<td>xxxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 2</td>
</tr>
<tr>
<td>xxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n>_EL1 addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;_EL1[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 4</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See Reserved DBGWCR<\textit{n}>, BAS values on page G2-9089.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:
0b01 Match instructions that load from a watchpointed address.
0b10 Match instructions that store to a watchpointed address.
0b11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint \textit{n} is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-4728.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Enable watchpoint \textit{n}. Possible values are:
0b0 Watchpoint disabled.
0b1 Watchpoint enabled.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGWCR<\textit{n}> EL1:**

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
DBGWCRₙ_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x888 + (16 * n)</td>
<td>DBGWCRₙ_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.9 **DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15**

The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

**Configurations**

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[63:0].

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

DBGWVR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA[52:49], bits [52:49]**

*When FEAT_LVA is implemented:*

VA[52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

RESS[3:0]

Extension to RESS[14:4]. For more information, see RESS[14:4].
VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESV.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>_EL1:

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1[63:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x800 + (16 * n)</td>
<td>DBGWVR&lt;n&gt;_EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.

• Otherwise accesses to this register generate an error response.
H9.2.10 EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

**Purpose**

Provides information about implemented PE features.

--- **Note** ---

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D17-5551.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDAA32PFR is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:20]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[19:16]</td>
<td>MSA_frac</td>
</tr>
<tr>
<td>[15:12]</td>
<td>EL3</td>
</tr>
<tr>
<td>[11:8]</td>
<td>EL2</td>
</tr>
<tr>
<td>[7:4]</td>
<td>PMSA</td>
</tr>
<tr>
<td>[3:0]</td>
<td>VMSA</td>
</tr>
</tbody>
</table>

**Bits [63:20]**

Reserved, RES0.

**MSA_frac, bits [19:16]**

When **EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:**

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

- 0b0001: PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
- 0b0010: PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

**Otherwise:**

Reserved, RES0.

**EL3, bits [15:12]**

When **EDPFR.EL3 == 0b0000:**

AArch32 EL3 Exception level handling. Defined values are:

- 0b0000: EL3 is not implemented or can be executed in AArch64 state.
- 0b0001: EL3 can be executed in AArch32 state only.

All other values are reserved.
EDPF.R.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:
Reserved, RAZ.

EL2, bits [11:8]

When EDPFR.EL2 == 0b0000:
AArch32 EL2 Exception level handling. Defined values are:
0b0000   EL2 is not implemented or can be executed in AArch64 state.
0b0001   EL2 can be executed in AArch32 state only.
All other values are reserved.

Note: EDPFR.EL1, EL0 indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:
Reserved, RAZ.

PMSA, bits [7:4]
Indicates support for a 32-bit PMSA. Defined values are:
0b0000   PMSA-32 not supported.
0b0100   PMSAv8-32 supported.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

When EDAA32PFR.PMSA != 0b0000:
Indicates support for a VMSA in addition to a 32-bit PMSA. Defined values are:
0b0000   VMSA not supported.
All other values are reserved.

When EDAA32PFR.PMSA == 0b0000:
Defined values are:
0b0000   VMSAv8-64 supported.
0b1111   Memory system architecture described by EDAA32PFR.MSA_frac.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

Otherwise:
Reserved, RAZ.

Accessing the EDAA32PFR:
EDAA32PFR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x060</td>
<td>EDAA32PFR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()` accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
H9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

**Purpose**

Allows implementations to support IMPLEMENTATION DEFINED controls.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is only implemented if DBGDEVID.AuxRegs == 0b0001.

If FEAT_DoPD is implemented, this register is implemented in the Core power domain.

If FEAT_DoPD is not implemented, the power domain that this register is implemented in is IMPLEMENTATION DEFINED.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK == 1, and when the Core is powered off.

**Attributes**

EDACR is a 32-bit register.

**Field descriptions**

| 31 | IMPLEMENTATION DEFINED | 0 |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- The following resets apply:
  - If the register is implemented in the Core power domain:
    - On a Cold reset, this field resets to an architecturally UNKNOWN value.
    - On an External debug reset, the value of this field is unchanged.
    - On a Warm reset, the value of this field is unchanged.
  - If the register is implemented in the External debug power domain:
    - On a Cold reset, the value of this field is unchanged.
    - On an External debug reset, this field resets to an architecturally UNKNOWN value.
    - On a Warm reset, the value of this field is unchanged.
Accessing the EDACR:

EDACR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x094</td>
<td>EDACR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
H9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-0</td>
<td>PRMBL_0, bits [7:0]</td>
</tr>
</tbody>
</table>

**PRMBL_0, bits [7:0]**

Preamble.

Reads as 0x0D.

Access to this field is RO.

**Accessing the EDCIDR0:**

EDCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFFF0</td>
<td>EDCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme on page K6-11699.*

**Configurations**

Implementation of this register is OPTIONAL.

If `FEAT_DoPD` is implemented, this register is in the Core power domain. If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
</tr>
<tr>
<td>7-4</td>
<td>CLASS</td>
</tr>
<tr>
<td>3-0</td>
<td>PRMBL_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

0b1001 CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Preamble.

Reads as 0b0000.

Access to this field is RO.

**Accessing the EDCIDR1:**

EDCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF4</td>
<td>EDCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.14   EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme* on page K6-11699.

**Configurations**

Implementation of this register is OPTIONAL.

If `FEAT_DoPD` is implemented, this register is in the Core power domain. If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
<th>RES0</th>
<th>PRMBL_2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0 0 0 0 0 1 0 1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.
Reads as 0x05.
Access to this field is RO.

**Accessing the EDCIDR2:**

EDCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF8</td>
<td>EDCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.15 EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme* on page K6-11699.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR3 is a 32-bit register.

**Field descriptions**

```
+-----+-----+-----+-----+-----+-----+-----+
| 31  | 30  | 29  | 28  | 27  | 26  | 25  |
|-----+-----+-----+-----+-----+-----+-----|
| RES0|     |     |     |     |     |     |
| 0 1 0 1 1 0 0 1|
|   | PRMBL_3|
```

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

Access to this field is RO.

**Accessing the EDCIDR3:**

EDCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFFC</td>
<td>EDCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.16 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

**Purpose**
Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

**Configurations**
EDCIDSR is in the Core power domain.
This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.
Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

--- Note ---
FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**
EDCIDSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>CONTEXTIDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**CONTEXTIDR, bits [31:0]**
Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is constrained unpredictable whether EDCIDSR is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the EDCIDSR:**
IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-10354.
EDCIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A4</td>
<td>EDCIDS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.17 EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVAFF0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1lo</td>
<td>MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.</td>
</tr>
</tbody>
</table>

**Accessing the EDDEVAFF0:**

EDDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF8</td>
<td>EDDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.18 EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVAFF1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1hi</td>
<td>31 0  MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.</td>
</tr>
</tbody>
</table>

**Accessing the EDDEVAFF1:**

EDDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFAC</td>
<td>EDDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.19   EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers’ model architecture of the external debug component.

Configurations

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>[31:21]</td>
<td>Defines the architecture of the component. For debug, this is Arm Limited.</td>
</tr>
<tr>
<td>REVISION</td>
<td>[19:16]</td>
<td>Defines the architecture revision. For architectures defined by Arm this is the minor revision. For debug, the revision defined by Armv8 is 0x0. All other values are reserved.</td>
</tr>
<tr>
<td>ARCHVER</td>
<td>[15:12]</td>
<td>Architecture Version. Defines the architecture version of the component. Defined values are:</td>
</tr>
<tr>
<td></td>

<td>0b1010 Armv8.8 debug architecture, FEAT_Debugv8p8.</td>
</tr>
<tr>
<td>ARCHPART</td>
<td>[11:0]</td>
<td>EDDEVARCH.ARCHVER and EDDEVARCH.ARCHID are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].</td>
</tr>
</tbody>
</table>

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision. For debug, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.
FEAT_VHE adds the functionality identified by the value 0b0111.
FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.
FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.
FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.
From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.
From Armv8.2, the values 0b0110 and 0b0111 are not permitted.
From Armv8.4, the value 0b1000 is not permitted.
From Armv8.8, the value 0b1001 is not permitted.

ARCHPART, bits [11:0]
Architecture Part. Defines the architecture of the component.
0xA15 Armv8-A debug architecture.
EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].
Armv8-A debug architecture.
Access to this field is RO.

Accessing the EDDEVARCH:
EDDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF8C</td>
<td>EDDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configurations

If FEAT_DoPD is implemented, this register is in the Core power domain.
If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit 31</th>
<th>Bit 28</th>
<th>Bit 27</th>
<th>Bit 24</th>
<th>Bit 23</th>
<th>Bit 8</th>
<th>Bit 7</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 0</th>

</thead>
<tbody>
<tr>
<td>RES0</td>
<td>AuxRegs</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>PCSample</td>
<td>DebugPower</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Defined values are:
0b0000 None supported.
0b0001 Support for External Debug Auxiliary Control Register, EDACR.
All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature. Defined values are:
0b0000 FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
0b0001 FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.
FEAT_DoPD implements the functionality added by the value 0b0001.
All other values are reserved.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:
0b0000 PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010 Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011 EDPCSR, EDCIDSR, and EDVIDSR are implemented.
All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.
External Debug Register Descriptions
H9.2 External debug registers

--- Note ---
FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Accessing the EDDEVID:

EDDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC8</td>
<td>EDDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.21  EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[7:4]</td>
<td>HSR</td>
</tr>
<tr>
<td>[3:0]</td>
<td>PCSROffset</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**HSR, bits [7:4]**

Indicates support for the External Debug Halt Status Register (EDHSR). Defined values are:

- **0b0000**  EDHSR is not implemented. The PE follows behaviors consistent with the EDHSR fields having a zero value.
- **0b0001**  EDHSR is implemented.

All other values are reserved.

If FEAT_SME is implemented, the permitted values are **0b0000** and **0b0001**.

If FEAT_SME is not implemented, the only permitted value is **0b0000**.

**PCSROffset, bits [3:0]**

Indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

- **0b0000**  EDPCSR not implemented.
- **0b0010**  EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is **0b0000**.

---

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

---

**Accessing the EDDEVID1:**

EDDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC4</td>
<td>EDDEVID1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### H9.2.22 EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID2 is a 32-bit register.

**Field descriptions**

| Bits [31:0] | RES0 |

Reserved, RES0.

**Accessing the EDDEVID2:**

EDDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC0</td>
<td>EDDEVID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.23 EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE's debug logic.

**Configurations**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVTYPE is a 32-bit register.

**Field descriptions**

| Bits [31:8] | Reserved, RES0. |
| SUB, bits [7:4] | Subtype. Indicates this is a component within a PE. Reads as 0b0001. Access to this field is RO. |
| MAJOR, bits [3:0] | Major type. Indicates this is a debug logic component. Reads as 0b0101. Access to this field is RO. |

**Accessing the EDDEVTYPE:**

EDDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFCC</td>
<td>EDDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
E2DFR, External Debug Feature Register

The E2DFR characteristics are:

**Purpose**

Provides top level information about the debug system.

--- Note ---

Debuggers must use EDDEVARCH to determine the Debug architecture version.

---

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

It is **IMPLEMENTATION DEFINED** whether E2DFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

E2DFR is a 64-bit register.

**Field descriptions**

<table>
<thead>

</table>
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Bits [27:24]**
Reserved, RES0.

**WRPs, bits [23:20]**
Number of watchpoints, minus 1. The value of 0b0000 is reserved.
In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.WRPs.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Bits [19:16]**
Reserved, RES0.

**BRPs, bits [15:12]**
Number of breakpoints, minus 1. The value of 0b0000 is reserved.
In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.BRPs.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**PMUVer, bits [11:8]**
Performance Monitors Extension version.
This field does not follow the standard ID scheme, but uses the alternative ID scheme described in Alternative ID scheme used for the Performance Monitors Extension version on page D17-5553.
Defined values are:

- **0b0000**: Performance Monitors Extension not implemented.
- **0b0001**: Performance Monitors Extension, PMUv3 implemented.
- **0b0100**: PMUv3 for Armv8.1. As 0b0001, and adds support for:
  - Extended 16-bit PMEVTYPE<El0>.evtCount field.
  - If EL2 is implemented, the MDCR_EL2.HPMD control.
- **0b0101**: PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
- **0b0110**: PMUv3 for Armv8.5. As 0b0101, and adds support for:
  - 64-bit event counters.
  - If EL2 is implemented, the MDCR_EL2.HCCD control.
  - If EL3 is implemented, the MDCR_EL3.SCCD control.
- **0b0111**: PMUv3 for Armv8.7. As 0b0110, and adds support for:
  - The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls.
  - If EL3 is implemented, the MDCR_EL3.\{MPMX,MCCD\} controls.
- **0b1000**: PMUv3 for Armv8.8. As 0b0111, and:
  - Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF.
  - Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
- **0b1111**: IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.
All other values are reserved.

**FEAT_PMUv3** implements the functionality identified by the value \(0b0001\).

**FEAT_PMUv3p1** implements the functionality identified by the value \(0b0100\).

**FEAT_PMUv3p4** implements the functionality identified by the value \(0b0101\).

**FEAT_PMUv3p5** implements the functionality identified by the value \(0b0110\).

**FEAT_PMUv3p7** implements the functionality identified by the value \(0b0111\).

**FEAT_PMUv3p8** implements the functionality identified by the value \(0b1000\).

From Armv8.1, if **FEAT_PMUv3** is implemented, the value \(0b0001\) is not permitted.

From Armv8.4, if **FEAT_PMUv3** is implemented, the value \(0b0100\) is not permitted.

From Armv8.5, if **FEAT_PMUv3** is implemented, the value \(0b0101\) is not permitted.

From Armv8.7, if **FEAT_PMUv3** is implemented, the value \(0b0110\) is not permitted.

From Armv8.8, if **FEAT_PMUv3** is implemented, the value \(0b0111\) is not permitted.

**TraceVer, bits [7:4]**

Trace support. Indicates whether System register interface to a trace unit is implemented. Defined values are:

- \(0b0000\) Trace unit System registers not implemented.
- \(0b0001\) Trace unit System registers implemented.

All other values are reserved.

A value of \(0b0000\) only indicates that no System register interface to a trace unit is implemented. A trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

**Bits [3:0]**

Reserved, UNKNOWN.

**Accessing the EDDFR:**

EDDFR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x028</td>
<td>EDDFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDDFR[31:0] are RO.
- Otherwise accesses to EDDFR[31:0] are IMPDEF.

EDDFR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x02C</td>
<td>EDDFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDDFR[63:32] are RO.
- Otherwise accesses to EDDFR[63:32] are IMPDEF.
H9.2.25  EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

**Purpose**

Controls Exception Catch debug events. For more information, see Exception Catch debug event on page H3-10287.

**Configurations**

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

EDECCR is in the Core power domain.

**Attributes**

EDECCR is a 32-bit register.

**Field descriptions**

Bits [31:23]

Reserved, RES0.

RLR2, bit [22]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLE2.

0b0  If EDECCR.RLE2 is 0, then Exception Catch debug events are disabled for Realm EL2.

0b1  If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.
RLR1, bit [21]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLE1.

0b0 If EDECCR.RLE1 is 0, then Exception Catch debug events are disabled for Realm EL1.
If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.

0b1 If EDECCR.RLE1 is 0, then Exception Catch debug events are enabled for exception entry to Realm EL1.
If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behavior of this field is:
• On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

RLR0, bit [20]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL0.

0b0 Exception Catch debug events are disabled for Realm EL0.

0b1 Exception Catch debug events are enabled for exception returns to Realm EL0.

The reset behavior of this field is:
• On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [19]

Reserved, RES0.

RLE2, bit [18]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL2. Also controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLR2.

0b0 If EDECCR.RLR2 is 0, then Exception Catch debug events are disabled for Realm EL2.
If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL2.

0b1 If EDECCR.RLR2 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2.
If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behavior of this field is:
• On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

RLE1, bit [17]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL1. Also controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLR1.

0b0 If EDECCR.RLR1 is 0, then Exception Catch debug events are disabled for Realm EL1.
If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL1.

- If EDECCR.RLR1 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.
- If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**RLE0, bit [16]**
Access to this field is RES0.

**NSR3, bit [15]**
Access to this field is RES0.

**NSR2, bit [14]**

*When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:*
Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

- If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2.
- If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**NSR1, bit [13]**

*When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:*
Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

- If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1.
- If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.
NSR0, bit [12]

When `FEAT_Debugv8p2` is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

- **0b0**: Exception Catch debug events are disabled for Non-secure EL0.
- **0b1**: Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

When `FEAT_Debugv8p2` is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

- **0b0**: If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3.
  
  If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.

- **0b1**: If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3.
  
  If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

SR2, bit [10]

When `FEAT_Debugv8p2` is implemented and `FEAT_SEL2` is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

- **0b0**: If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2.
  
  If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.

- **0b1**: If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2.
  
  If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

SR1, bit [9]

When `FEAT_Debugv8p2` is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

- **0b0**: If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1.
  
  If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.

- **0b1**: If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1.
If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

SR0, bit [8]

When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:
Controls exception catch on exception return to Secure EL0.
0b0 Exception Catch debug events are disabled for Secure EL0.
0b1 Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

NSE3, bit [7]
Access to this field is RES0.

NSE2, bit [6]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:
Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.
0b0 If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2.
0b1 If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.

Note
It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

When Non-secure EL2 is implemented:
Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.
0b0 Exception Catch debug events are disabled for Non-secure EL2.
0b1 Exception Catch debug events are enabled for Non-secure EL2.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Otherwise:
Reserved, RES0.
NSE1, bit \[5\]

*When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:*

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

0b0  
If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1.
If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.

0b1  
If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.
If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

--- Note ---

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

---

The reset behavior of this field is:

* On a Cold reset, this field resets to 0.

NSE0, bit \[4\]

Access to this field is RES0.

SE3, bit \[3\]

*When FEAT_Debugv8p2 is implemented and EL3 is implemented:*

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

0b0  
Exception Catch debug events are disabled for Non-secure EL1.

0b1  
Exception Catch debug events are enabled for Non-secure EL1.

The reset behavior of this field is:

* On a Cold reset, this field resets to 0.

--- Note ---

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

---

The reset behavior of this field is:

* On a Cold reset, this field resets to 0.
When FEAT_Debugv8p2 is not implemented and EL3 is implemented:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

- 0b0: Exception Catch debug events are disabled for EL3.
- 0b1: Exception Catch debug events are enabled for EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

- 0b0: If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
- 0b1: If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

--- Note ---

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

- 0b0: If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
- 0b1: If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

--- Note ---

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.
**When Secure EL1 is implemented:**

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

- **0b0** Exception Catch debug events are disabled for Secure EL1.
- **0b1** Exception Catch debug events are enabled for Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SE0, bit [0]**

Access to this field is RES0.

**Accessing the EDECCR:**

EDECCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x098</td>
<td>EDECCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.26   EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose
Controls Halting debug events.

Configurations
- If FEAT_DoPD is implemented, this register is in the Core power domain.
- If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes
- EDECR is a 32-bit register.

Field descriptions

Res0  SS  RCE  OSUCE

Bits [31:3]
Reserved, RES0.

SS, bit [2]
- Halting step enable. Possible values of this field are:
  - 0b0  Halting step debug event disabled.
  - 0b1  Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in Changing the value of EDECR.SS when not in Debug state on page H3-10283.

The reset behavior of this field is:
- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.

RCE, bit [1]
When FEAT_DoPD is not implemented:
- Reset Catch Enable.
  - 0b0  Reset Catch debug event disabled.
  - 0b1  Reset Catch debug event enabled.

The reset behavior of this field is:
- On an External debug reset, this field resets to 0.

Otherwise:
- Reserved, RES0.

OSUCE, bit [0]
When FEAT_DoPD is not implemented:
- OS Unlock Catch Enable.
  - 0b0  OS Unlock Catch debug event disabled.
  - 0b1  OS Unlock Catch debug event enabled.
The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Accessing the EDECR:**

EDECR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x024</td>
<td>EDECR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.

- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.

- Otherwise accesses to this register generate an error response.
H9.2.27  EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configurations

EDESR is in the Core power domain.

Attributes

EDESR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

EC, bit [3]

When FEAT_Debugv8p8 is implemented:

Exception Catch debug event pending.

0b0  Exception Catch debug event is not pending.

0b1  Exception Catch debug event is pending.

The reset behavior of this field is:

•  On a Warm reset, this field resets to 0.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

SS, bit [2]

When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

0b0  Reading this means that a Halting step debug event is not pending. Writing this means no action.

0b1  Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

•  On a Cold reset, this field resets to 0.

Otherwise:

Halting step debug event pending. Possible values of this field are:

0b0  Reading this means that a Halting step debug event is not pending. Writing this means no action.

0b1  Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.
The reset behavior of this field is:

- On a Warm reset, this field resets to the value in EDECR.SS.

**RC, bit [1]**

Reset Catch debug event pending. Possible values of this field are:

0b0 Reading this means that a Reset Catch debug event is not pending. Writing this means no action.

0b1 Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_DoPD is implemented, this field resets to the value in CTIDEVCTL.RCE.
  - When FEAT_DoPD is not implemented, this field resets to the value in EDECR.RCE.

**OSUC, bit [0]**

OS Unlock Catch debug event pending. Possible values of this field are:

0b0 Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.

0b1 Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

**Accessing the EDESR:**

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONstrained UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x020</td>
<td>EDESR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.28  EDHSR, External Debug Halt Status Register

The EDHSR characteristics are:

**Purpose**

Provides Debug Halt Status information.

**Configurations**

EDHSR is in the Core power domain.

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to EDHSR are RES0.

This register is only valid when the PE is in Debug state and \texttt{EDSCR.STATUS} is 0b101011, indicating a Watchpoint debug event. Otherwise, it has an UNKNOWN value.

The field \texttt{EDDEVID1.HSR} indicates support for this register.

**Attributes**

EDHSR is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-24</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>31-23</td>
<td>WPT</td>
<td>0 to 15</td>
</tr>
<tr>
<td>18-16</td>
<td>All other values</td>
<td>Reserved</td>
</tr>
<tr>
<td>15-10</td>
<td>The reset behavior of this field is:</td>
<td></td>
</tr>
<tr>
<td>9-0</td>
<td>WPTV</td>
<td>0b0</td>
</tr>
<tr>
<td>10-9</td>
<td>The WPT field is invalid, and holds an UNKNOWN value.</td>
<td></td>
</tr>
<tr>
<td>9-0</td>
<td>WPTV</td>
<td>0b1</td>
</tr>
<tr>
<td>10-9</td>
<td>The WPT field is valid, and holds the number of a watchpoint that triggered an entry to Debug state.</td>
<td></td>
</tr>
</tbody>
</table>

When an entry to Debug state is triggered by a watchpoint match:

- If the PE sets any of \texttt{FnV}, \texttt{FnP}, or \texttt{WPF} to 1, then the PE sets \texttt{WPTV} to 1.
- If the PE sets all of \texttt{FnV}, \texttt{FnP}, and \texttt{WPF} to 0, then the PE sets \texttt{WPTV} to an IMPLEMENTATION DEFINED value, 0 or 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
WPF, bit [16]

Watchpoint might be false-positive.

0b0 The watchpoint matched the original access or set of contiguous accesses.
0b1 The watchpoint matched an access or set of contiguous accesses where the lowest accessed address was rounded down to the nearest multiple of 16 bytes and the highest accessed address was rounded up to the nearest multiple of 16 bytes minus 1, but the watchpoint might not have matched the original access or set of contiguous accesses.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

FnP, bit [15]

FAR not Precise.

This field only has meaning if the EDWAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

0b0 If the FnV field is 0, the EDWAR holds the virtual address of an access or set of contiguous accesses that triggered an entry to Debug state.
0b1 The EDWAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered an entry to Debug state.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [14:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid.

0b0 The EDWAR is valid, and its value is as described by the FnP field.
0b1 The EDWAR is invalid, and holds an UNKNOWN value.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing the EDHSR:

EDHSR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x038</td>
<td>EDHSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDHSR[31:0] are RO.
• Otherwise accesses to EDHSR[31:0] generate an error response.
EDHSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x03C</td>
<td>EDHSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDHSR[63:32] are RO.
- Otherwise accesses to EDHSR[63:32] generate an error response.
H9.2.29 EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

**Purpose**

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

EDITCTRL is a 32-bit register.

**Field descriptions**

![Field description diagram](image)

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

The reset behavior of this field is:

- The following resets apply:
  - Whichever power domain the register is implemented in, this field resets to 0.
  - Otherwise, the value of this field is unchanged.

**Accessing the EDITCTRL:**

EDITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF00</td>
<td>EDITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
• Otherwise accesses to this register are IMPDEF.
H9.2.30   EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

**Purpose**

Used in Debug state for passing instructions to the PE for execution.

**Configurations**

EDITR is in the Core power domain.

**Attributes**

EDITR is a 32-bit register.

**Field descriptions**

*When AArch32 is supported and in AArch32 state:*

| 31 | hw2 | 16 | 15 | hw1 | 0 |

**hw2, bits [31:16]**

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see Behavior in Debug state on page H2-10242.

**Note**

The hw2 field is displayed on the left. This is not the usual convention for display of T32 instruction halfwords.

**hw1, bits [15:0]**

First halfword of the T32 instruction to be executed on the PE.

**Note**

The hw1 field is displayed on the right. This is not the usual convention for display of T32 instruction halfwords.

*When AArch64 is supported and in AArch64 state:*

| 31 | A64 instruction to be executed on the PE | 0 |

**Bits [31:0]**

A64 instruction to be executed on the PE.

**Accessing the EDITR:**

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x004</td>
<td>EDITR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
H9.2.31   EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface. The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td>Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface. Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.</td>
</tr>
</tbody>
</table>

Otherwise:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Accessing the EDLAR:

EDLAR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB0</td>
<td>EDLAR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
H9.2.32 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>nTT, bit [2] Not thirty-two bit access required. RAZ.</td>
</tr>
<tr>
<td>2</td>
<td>SLK, bit [1] When Software Lock is implemented:</td>
</tr>
<tr>
<td></td>
<td>Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.</td>
</tr>
<tr>
<td></td>
<td>For memory-mapped accesses when Software Lock is implemented, possible values of this field are:</td>
</tr>
<tr>
<td></td>
<td>0b0 Lock clear. Writes are permitted to this component's registers.</td>
</tr>
<tr>
<td></td>
<td>0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.</td>
</tr>
<tr>
<td></td>
<td>The reset behavior of this field is:</td>
</tr>
<tr>
<td></td>
<td>• On a Cold reset, when FEAT_DoPD is implemented, this field resets to 1.</td>
</tr>
<tr>
<td></td>
<td>• On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 1.</td>
</tr>
<tr>
<td>1</td>
<td>SLI, bit [0] Otherwise:</td>
</tr>
<tr>
<td></td>
<td>Reserved, RAZ.</td>
</tr>
<tr>
<td>0</td>
<td>SLI, bit [0] Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:</td>
</tr>
<tr>
<td></td>
<td>0b0 Software Lock not implemented or not memory-mapped access.</td>
</tr>
</tbody>
</table>
Software Lock implemented and memory-mapped access.

**Accessing the EDLSR:**

EDLSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF84</td>
<td>EDLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.33  **EDPCSR, External Debug Program Counter Sample Register**

The EDPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configurations**

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

--- **Note** ---

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDPCSR is a 64-bit register.

**Field descriptions**

*When FEAT_VHE is not implemented or EDSCR.SC2 == 0:*

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PC Sample high word, EDPCSRhi</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>PC Sample low word</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xffffffff when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xffffffff.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
• No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
• No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values. Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.\{NS,E2,E3\}. For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When FEAT_VHE is implemented and EDSCR.SC2 == 1:**

```
<table>
<thead>
<tr>
<th>NS</th>
<th>EL</th>
<th>RES0</th>
<th>PC Sample high word, EDPCSRhi</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
</tr>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
</tr>
</tbody>
</table>
```

**NS, bit [63]**
Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.\{NS,EL\}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

0b0  Sample is from Secure state.
0b1  Sample is from Non-secure state.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**EL, bits [62:61]**
Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.\{NS,EL\}.

0b00  Sample is from EL0.
0b01  Sample is from EL1.
0b10  Sample is from EL2.
0b11  Sample is from EL3.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [60:56]**
Reserved, RES0.

**Bits [55:32]**
PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.\{NS,EL\}.
The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:
- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:
- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.[NS,EL].

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the EDPCSR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-10354

EDPCSR[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A0</td>
<td>EDPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDPCSR[31:0] are RO.
- Otherwise accesses to EDPCSR[31:0] generate an error response.

EDPCSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0AC</td>
<td>EDPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDPCSR[63:32] are RO.
- Otherwise accesses to EDPCSR[63:32] generate an error response.
H9.2.34  EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

**Purpose**

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers on page D17-5551.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDPFR is a 64-bit register.

**Field descriptions**

**Bits [63:60]**

*From Armv8.5:*

Reserved, UNKNOWN.

*Otherwise:*

Reserved, RES0.

**Bits [59:56]**

*From Armv8.5:*

Reserved, UNKNOWN.

*Otherwise:*

Reserved, RES0.

**Bits [55:52]**

Reserved, RES0.

**Bits [51:48]**

*From Armv8.4:*

Reserved, UNKNOWN.

*Otherwise:*

Reserved, RES0.

**AMU, bits [47:44]**

Indicates support for Activity Monitors Extension. Defined values are:

0b0000  Activity Monitors Extension is not implemented.

0b0001  FEAT_AMUv1 is implemented.

0b0010  FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.
All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

**Bits [43:40]**

*From Armv8.2:*

Reserved, UNKNOWN.

*Otherwise:*

Reserved, RES0.

**SEL2, bits [39:36]**

Secure EL2. Defined values are:

- 0b0000 Secure EL2 is not implemented.
- 0b0001 Secure EL2 is implemented.

All other values are reserved.

**SVE, bits [35:32]**

Scalable Vector Extension. Defined values are:

- 0b0000 SVE is not implemented.
- 0b0001 SVE is implemented.

All other values are reserved.

**Bits [31:28]**

*From Armv8.2:*

Reserved, UNKNOWN.

*Otherwise:*

Reserved, RES0.

**GIC, bits [27:24]**

System register GIC interface support. Defined values are:

- 0b0000 GIC CPU interface system registers not implemented.
- 0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- 0b0011 System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.GIC.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

- 0b0000 Advanced SIMD is implemented, including support for the following SISD and SIMD operations:
  - Integer byte, halfword, word and doubleword element operations.
  - Single-precision and double-precision floating-point arithmetic.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111        Advanced SIMD is not implemented.
All other values are reserved.
This field must have the same value as the FP field.
The permitted values are:
  • 0b0000 in an implementation with Advanced SIMD support, that does not include the
    FEAT_FP16 extension.
  • 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16
    extension.
  • 0b1111 in an implementation without Advanced SIMD support.
In an Armv8-A implementation that supports AArch64, this field returns the value of
ID_AA64PFR0_EL1.AdvSIMD.

FP, bits [19:16]
Floating-point. Defined values are:
0b0000  Floating-point is implemented, and includes support for:
    • Single-precision and double-precision floating-point types.
    • Conversions between single-precision and half-precision data types, and
      double-precision and half-precision data types.
0b0001  As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111  Floating-point is not implemented.
All other values are reserved.
This field must have the same value as the AdvSIMD field.
The permitted values are:
  • 0b0000 in an implementation with floating-point support, that does not include the
    FEAT_FP16 extension.
  • 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16
    extension.
  • 0b1111 in an implementation without floating-point support.
In an Armv8-A implementation that supports AArch64, this field returns the value of
ID_AA64PFR0_EL1.FP.

EL3, bits [15:12]
AArch64 EL3 Exception level handling. Defined values are:
0b0000  EL3 is not implemented or cannot be executed in AArch64 state.
0b0001  EL3 can be executed in AArch64 state only.
0b0010  EL3 can be executed in both Execution states.
When the value of EDAA32PFR.EL3 is non-zero, this field must be 0b0000.
All other values are reserved.
In an Armv8-A implementation that supports AArch64, this field returns the value of
ID_AA64PFR0_EL1.EP.

EL2, bits [11:8]
AArch64 EL2 Exception level handling. Defined values are:
0b0000  EL2 is not implemented or cannot be executed in AArch64 state.
0b0001  EL2 can be executed in AArch64 state only.
0b0010  EL2 can be executed in both Execution states.
When the value of EDAA32PFR.EL2 is non-zero, this field must be 0b0000.
All other values are reserved.
In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL2.

**EL1, bits [7:4]**

AArch64 EL1 Exception level handling. Defined values are:

- **0b0000**  EL1 cannot be executed in AArch64 state.
  EL1 can be executed in AArch32 state only.
- **0b0001**  EL1 can be executed in AArch64 state only.
- **0b0010**  EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL1.

**EL0, bits [3:0]**

AArch64 EL0 Exception level handling. Defined values are:

- **0b0000**  EL0 cannot be executed in AArch64 state.
  EL0 can be executed in AArch32 state only.
- **0b0001**  EL0 can be executed in AArch64 state only.
- **0b0010**  EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL0.

**Accessing the EDPFR:**

EDPFR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x20</td>
<td>EDPFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDPFR[31:0] are RO.
- Otherwise accesses to EDPFR[31:0] are IMPDEF.

EDPFR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x24</td>
<td>EDPFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDPFR[63:32] are RO.
- Otherwise accesses to EDPFR[63:32] are IMPDEF.
H9.2.35  **EDPIDR0, External Debug Peripheral Identification Register 0**

The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

**Field descriptions**

![Diagram of EDPIDR0 register]

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:0</td>
<td>Part number, least significant byte. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the EDPIDR0:**

EDPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE0</td>
<td>EDPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.36  EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see About the Peripheral identification scheme on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>

</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**PART_1, bits [3:0]**

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the EDPIDR1:**

EDPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE4</td>
<td>EDPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.37   EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is optional.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>

</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVISION</td>
<td>1</td>
<td>DES_1</td>
<td>JEDEC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an implementation defined value.

Access to this field is RO.

**JEDEC, bit [3]**

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is RO.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b11.

This field has an implementation defined value.

Access to this field is RO.

**Accessing the EDPIDR2:**

EDPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE8</td>
<td>EDPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
H9.2.38   EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>REVAND, bits [7:4]</td>
<td>Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.</td>
</tr>
<tr>
<td>CMOD, bits [3:0]</td>
<td>Customer modified. Indicates someone other than the Designer has modified the component.</td>
</tr>
</tbody>
</table>

**Accessing the EDPIDR3:**

EDPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component Offset Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug 0xFEC EDPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.39 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Peripheral identification scheme on page K6-11696*.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>SIZE</td>
<td>Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers. Reads as $0b0000. Access to this field is RO.</td>
</tr>
<tr>
<td>3</td>
<td>DES_2</td>
<td>Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is $0b0100. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the EDPIDR4:**

EDPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFD0</td>
<td>EDPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.40   EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

**Purpose**

Controls the PE functionality related to powerup, reset, and powerdown.

**Configurations**

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

**Attributes**

EDPRCR is a 32-bit register.

**Field descriptions**

*When FEAT_DoPD is implemented:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0, reserved</td>
</tr>
<tr>
<td>30-2</td>
<td>CWRR, bit [1]</td>
</tr>
<tr>
<td>1</td>
<td>CORENPDRQ, reserved</td>
</tr>
</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**CWRR, bit [1]**

*When FEAT_RME is implemented:*

The PE ignores all writes to this bit.

*Otherwise:*

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action</td>
</tr>
<tr>
<td>0b1</td>
<td>Request Warm reset</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.
The reset behavior of this field is:
  • On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:
  • RAZ/WI if any of the following are true:
    — `OSLockStatus()`
    — `SoftwareLockStatus()`
  • Otherwise, access to this field is WO/RAZ

**CORENPDRQ**, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

- 0b0 If the system responds to a powerdown request, it powers down Core power domain.
- 0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the `DBGPRCR.CORENPDRQ` and `DBGPRCR_EL1.CORENPDRQ` fields.

In an implementation that includes the recommended external debug interface, this bit drives the `DBGNOPWRDWN` signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see *Core power domain power states on page H6-10336*.

---

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

---

The reset behavior of this field is:
  • On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:
  • When `OSLockStatus()`, access to this field is UNKNOWN/WI.
  • When `SoftwareLockStatus()`, access to this field is RO.
  • Otherwise, access to this field is RW

**Otherwise:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CORENPDRQ | COREPURQ | RES0 | CWRR |

**Bits [31:4]**

Reserved, RES0.
COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 Do not request power up of the Core power domain.
0b1 Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

--- Note ---

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:
• On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RW

Bit [2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:
• The request is ignored.
• Only this PE is Warm reset.
• This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

0b0 No action.
0b1 Request Warm reset.

This field is in the Core power domain.

The PE ignores writes to this bit if any of the following are true:
• ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.
The reset behavior of this field is:
• On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:
• RAZ/WI if any of the following are true:
  — !IsCorePowered()
  — DoubleLockStatus()
  — OSLockStatus()
  — SoftwareLockStatus()
• Otherwise, access to this field is WO/RAZ

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.
This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.
0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.
This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.
It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPCCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see Core power domain power states on page H6-10336.

——- Note ———
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:
• On a Cold reset, this field resets to the value in EDPCCR.COREPURQ.

Accessing this field has the following behavior:
• UNKNOWN/WI if any of the following are true:
  — !IsCorePowered()
  — DoubleLockStatus()
  — OSLockStatus()
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RW

Accessing the EDPCCR:

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPCCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x310</td>
<td>EDPCCR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.41 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

**Purpose**

Holds information about the reset and powerdown state of the PE.

**Configurations**

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

**Attributes**

EDPRSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>29</td>
<td>EPMADE, bit [16]</td>
</tr>
<tr>
<td>28</td>
<td>ETADE, bit [15]</td>
</tr>
</tbody>
</table>

**EPMADE, bit [16]**

*When FEAT_RME is implemented, FEAT_PMUv3 is implemented and external debugger access to the Performance Monitors Extension registers is implemented:*

External Performance Monitors Access Disable Extended Status. Together with EDPRSRE.PMAD, reports whether access to Performance Monitor registers by an external debugger is permitted.

For a description of the values derived by evaluating PMAD and EPMADE together, see EDPRSRE.PMAD.

*Otherwise:*

Reserved, RES0.

**ETADE, bit [15]**

*When FEAT_RME is implemented, external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:*

External Trace Access Disable Extended Status. Together with EDPRSRE.TAD, reports whether access to trace unit registers by an external debugger is permitted.

For a description of the values derived by evaluating TAD and ETADE together, see EDPRSRE.TAD.

*Otherwise:

Reserved, RES0.*
EDADE, bit [14]

When FEAT_RME is implemented:

External Debug Access Disable Extended Status. Together with EDPRSR.EDAD, reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is permitted.

For a description of the values derived by evaluating EDAD and EDADE together, see EDPRSR.EDAD.

Otherwise:

Reserved, RES0.

STAD, bit [13]

When external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external trace register returns an error because AllowExternalTraceAccess () == FALSE for the access.

0b0 Since EDPRSR was last read, no external accesses to the trace unit registers have failed because AllowExternalTraceAccess () was FALSE for the access.

0b1 Since EDPRSR was last read, at least one external access to the trace unit registers has failed because AllowExternalTraceAccess () was FALSE for the access.

If IsCorePowered () == TRUE, the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus () == FALSE then this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus () == TRUE then it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - DoubleLockStatus()
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - EDPRSR.R == 1

- Otherwise, access to this field is RC/WI

Otherwise:

Reserved, RES0.
ETAD, bit [12]

When FEAT_RME is implemented, external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Status. Together with EDPRSR.ETADE, reports whether access to trace unit registers by an external debugger is permitted.

<table>
<thead>
<tr>
<th>ETAEDE</th>
<th>ETAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Access to trace unit registers by an external debugger is permitted.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Root and Secure access to trace unit registers by an external debugger is permitted. Realm and Non-secure access to trace unit registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root and Realm access to trace unit registers by an external debugger is permitted. Secure and Non-secure access to trace unit registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Root access to trace unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to trace unit registers by an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

When external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable status.

| 0b0 | External Non-secure trace unit accesses enabled. AllowExternalTraceAccess() == TRUE for a Non-secure access. |
| 0b1 | External Non-secure trace unit accesses disabled. AllowExternalTraceAccess() == FALSE for a Non-secure access. |

This bit is in the Core power domain.

Note
If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Accessing this field has the following behavior:
- UNKNOWN/WI if any of the following are true:
  - DoubleLockStatus()
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - EDPRSR.R == 1
- Otherwise, access to this field is RO

Otherwise:
Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.
Permitted values are:

| 0b0 | The PE has not restarted since EDPRSR was last read. |
| 0b1 | The PE has restarted since EDPRSR was last read. |

Note
If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If the Core power domain is powered up, then following a read of EDPRSR:
- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
• If `FEAT_DoubleLock` is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
• UNKNOWN/WI if any of the following are true:
  — `FEAT_DoPD` is not implemented and !IsCorePowered()
  — `DoubleLockStatus()`
  — `EDPRSR.R == 1`
• When `SoftwareLockStatus()`, access to this field is RO.
• Otherwise, access to this field is RC/WI

**SPMAD, bit [10]**

*When `FEAT_Debugv8p4` is implemented, `FEAT_PMUv3` is implemented and external debugger access to the Performance Monitors Extension registers is implemented:*

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because `AllowExternalPMUAccess()` == FALSE.

Permitted values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because <code>AllowExternalPMUAccess()</code> == FALSE for the access since <code>EDPRSR</code> was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because <code>AllowExternalPMUAccess()</code> == FALSE for the access since <code>EDPRSR</code> was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then following a read of `EDPRSR`:
• If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus()` == FALSE, this bit clears to 0.
• If `FEAT_DoubleLock` is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:
• On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:
• UNKNOWN/WI if any of the following are true:
  — `FEAT_DoPD` is not implemented and !IsCorePowered()
  — `DoubleLockStatus()`
  — `EDPRSR.R == 1`
• When `SoftwareLockStatus()`, access to this field is RO.
• Otherwise, access to this field is RC/WI

*When `FEAT_PMUv3` is implemented and external debugger access to the Performance Monitors Extension registers is implemented:*

Sticky EPMAD error.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No external debug interface accesses to the Performance Monitors registers have failed because <code>AllowExternalPMUAccess()</code> == FALSE since <code>EDPRSR</code> was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one external debug interface access to the Performance Monitors registers has failed and returned an error because <code>AllowExternalPMUAccess()</code> == FALSE since <code>EDPRSR</code> was last read.</td>
</tr>
</tbody>
</table>
If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - OSLockStatus()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC/WI

**Otherwise:**

Reserved, RES0.

**EPMAD, bit [9]**

*When FEAT_RME is implemented, FEAT_PMUv3 is implemented and external debugger access to the Performance Monitors Extension registers is implemented:*

External Performance Monitors Access Disable Status. Together with EDPRSR.EPMADE, reports whether access to Performance Monitor registers by an external debugger is permitted.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Access to Performance Monitor registers by an external debugger is permitted.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

*When FEAT_Debugv8p4 is implemented, FEAT_PMUv3 is implemented and external debugger access to the Performance Monitors Extension registers is implemented:*

External Performance Monitors Non-secure Access Disable status.

- 0b0 External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
- 0b1 External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered()
— DoubleLockStatus()
— EDPRS.R == 1

• Otherwise, access to this field is RO

When FEAT_PMUv3 is implemented, external debugger access to the Performance Monitors Extension registers is implemented and FEAT_Debugv8p4 is not implemented:

External Performance Monitors access disable status.

0b0 External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
0b1 External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

• UNKNOW/NWI if any of the following are true:
  — FEAT_DoPD is not implemented and !IsCorePowered()
  — OSI LockStatus()
  — DoubleLockStatus()
  — EDPRS.R == 1

• Otherwise, access to this field is RO

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

0b0 No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRS.R was last read.
0b1 At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRS.R was last read.

If the Core power domain is powered up, then, following a read of EDPRS.R:

• If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
• If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

• On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

• UNKNOWN/WI if any of the following are true:
  — FEAT_DoPD is not implemented and !IsCorePowered()
  — DoubleLockStatus()
  — EDPRS.R == 1

• Otherwise, access to this field is RO

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

0b0 No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRS.R was last read.
At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is RO

**EDAD, bit [7]**

*When FEAT_RME is implemented:*

External Debug Access Disable Status. Together with EDPRSR.EDADE, reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is permitted.

<table>
<thead>
<tr>
<th>EDADE</th>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Access to Debug registers by an external debugger is permitted.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

*When FEAT_Debugv8p4 is implemented:*

External Debug Access Disable status.

- 0b0: External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.
- 0b1: External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is RO
When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status.

0b0  External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.

0b1  External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is RO

Otherwise:

External Debug Access Disable status.

0b0  External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.

0b1  External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is RO

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- RAZ/WI if all of the following are true:
  - IsCorePowered()
  - !DoubleLockStatus()
- Otherwise, access to this field is UNKNOWN/WI

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
• EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.
  This field is in the Core power domain.
  0b0   DoubleLockStatus() returns FALSE.
  0b1   DoubleLockStatus() returns TRUE and the Core power domain is powered up.
  Accessing this field has the following behavior:
  • UNKNOWN/WI if all of the following are true:
    — FEAT_DoPD is not implemented
    — !IsCorePowered()
    — EDPRSR.R == 1
  • Otherwise, access to this field is RO

Otherwise:
  Reserved, RES0.

OSLK, bit [5]
  OS Lock status bit.
  A read of this bit returns the value of OSLSR_EL1.OSLK.
  This field is in the Core power domain.
  Accessing this field has the following behavior:
  • UNKNOWN/WI if all of the following are true:
    — FEAT_DoPD is not implemented
    — !IsCorePowered()
    — DoubleLockStatus()
  • Otherwise, access to this field is RO

HALTED, bit [4]
  Halted status bit.
  0b0   PE is in Non-debug state.
  0b1   PE is in Debug state.
  This field is in the Core power domain.
  Accessing this field has the following behavior:
  • UNKNOWN/WI if all of the following are true:
    — FEAT_DoPD is not implemented
    — !IsCorePowered()
  • Otherwise, access to this field is RO

SR, bit [3]
  Sticky core Reset status bit.
  Permitted values are:
  0b0   The non-debug logic of the PE is not in reset state and has not been reset since the last
time EDPRSR was read.
  0b1   The non-debug logic of the PE is in reset state or has been reset since the last time
EDPRSR was read.
  If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is
in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read
of EDPRSR:
  • If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to
  0.
  • If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED
  UNPREDICTABLE whether this bit clears to 0 or is unchanged.
This field is in the Core power domain.
The reset behavior of this field is:
• On a Warm reset, this field resets to 1.
Accessing this field has the following behavior:
• UNKNOWN/WI if any of the following are true:
  — FEAT_DoPD is not implemented and !IsCorePowered()
  — DoubleLockStatus()
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RC/WI

R, bit [2]
PE Reset status bit.
Permitted values are:
0b0 The non-debug logic of the PE is not in reset state.
0b1 The non-debug logic of the PE is in reset state.
If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with
the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more
information, see EDPRSR.{DLK, R} and reset state on page H6-10343.
This field is in the Core power domain.
Accessing this field has the following behavior:
• UNKNOWN/WI if any of the following are true:
  — FEAT_DoPD is not implemented and !IsCorePowered()
  — DoubleLockStatus()
• Otherwise, access to this field is RO

SPD, bit [1]
Sticky core Powerdown status bit.
If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:
• If FEAT_Debugv8p2 is implemented, this bit reads as 0.
• If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.
For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-10342.
0b0 If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core
power domain is lost.
  If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not
been lost.
0b1 The state of the debug registers in the Core power domain has been lost.
If the Core power domain is powered up, then, following a read of EDPRSR:
• If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to
  0.
• If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED
  UNPREDICTABLE whether this bit clears to 0 or is unchanged.
When FEAT_DoPD is not implemented and the Core power domain is in either retention or
powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information,
see EDPRSR.SPD when the Core domain is in either retention or powerdown state on page H6-10343.
EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed,
and whether their state has been lost since the last time the register was read. For more information,
see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-10342.
This field is in the Core power domain.
The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- RAZ/WI if all of the following are true:
  - FEAT_DoPD is not implemented
  - !IsCorePowered()
- UNKNOWN/WI if all of the following are true:
  - !IsCorePowered()
  - DoubleLockStatus()
- Otherwise, access to this field is RO

**PU, bit [0]**

*When FEAT_DoPD is implemented:*

Core powerup status bit.
Access to this field is RAO/WI.

*When FEAT_Debugv8p2 is implemented:*

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

- 0b0  Either the Core power domain is in a low-power or powerdown state, or
  FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.

- 0b1  The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see EDPRSR.{DLK, R} and reset state on page H6-10343

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-10342

Access to this field is RO.

*Otherwise:*

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

- 0b0  Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.

- 0b1  Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see EDPRSR.{DLK, R} and reset state on page H6-10343

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-10342.
Access to this field is RO.

**Accessing the EDPRSR:**

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If **FEAT_DoubleLock** is not implemented or **DoubleLockStatus() == FALSE**, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).

- If **FEAT_DoubleLock** is implemented and **DoubleLockStatus() == TRUE**, it is **CONSTRAINED UNPREDICTABLE** whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all **UNKNOWN**, and are either reset or restored on being powered up.

- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x314</td>
<td>EDPRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.

- Otherwise accesses to this register generate an error response.
H9.2.42  EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

**Purpose**

This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

**Configurations**

EDRCR is in the Core power domain.

**Attributes**

EDRCR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:5]</td>
<td>Reserved, RES0</td>
<td></td>
<td></td>

<tr>
<td>[1:0]</td>
<td>Reserved, RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Accessing the EDRCR:

EDCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x090</td>
<td>EDR CR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
H9.2.43  EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configurations**

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

EDSCR is in the Core power domain.

**Attributes**

EDSCR is a 32-bit register.

**Field descriptions**

TFO, bit [31]

*When FEAT_TRF is implemented:*

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

- **0b0** Trace Filter controls are not affected.
- **0b1** Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored.
  Trace Filter controls TRFCR and HTRFCR are ignored.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRExt.

This bit is ignored by the PE when any of the following is true:

- ExternalSecureNoninvasiveDebugEnabled() is FALSE and the Effective value of MDCR_EL3.STE is 1.
- FEAT_RME is implemented, ExternalRealmNoninvasiveDebugEnabled() is FALSE, and the Effective value of MDCR_EL3.RLTE is 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

RXfull, bit [30]

DTRRX full.
The reset behavior of this field is:
- On a Cold reset, this field resets to 0.
Access to this field is RO.

**TXfull, bit [29]**

DTRTX full.
The reset behavior of this field is:
- On a Cold reset, this field resets to 0.
Access to this field is RO.

**ITO, bit [28]**

ITR overrun. Set to 0 on entry to Debug state.
Accessing this field has the following behavior:
- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO

**RXO, bit [27]**

DTRRX overrun.
The reset behavior of this field is:
- On a Cold reset, this field resets to 0.
Access to this field is RO.

**TXU, bit [26]**

DTRTX underrun.
The reset behavior of this field is:
- On a Cold reset, this field resets to 0.
Access to this field is RO.

**PipeAdv, bit [25]**

Pipeline Advance. Indicates that software execution is progressing.

0b0  No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.

0b1  Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

When FEAT_MOPS is implemented, CPY, CPYF, SET, and SETG are examples of instructions that periodically make forward progress.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Access to this field is RO.

**ITE, bit [24]**

ITR empty.
Accessing this field has the following behavior:
- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO
INTdis, bits [23:22]

When FEAT_RME is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

0b00  This bit has no effect on the masking of interrupts.
0b01  If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked.
      If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.
      If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts taken to Root state are masked.
      If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts taken to Realm state are masked.

——— Note ————
All interrupts includes virtual and SError interrupts.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

• MDSCR_EL1.
• DBGDSCRext.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

• On a Cold reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

0b00  Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01  If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked.
      If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

——— Note ————
All interrupts includes virtual and SError interrupts.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

• MDSCR_EL1.
• DBGDSCRext.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

• On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable. Disables taking interrupts in Non-debug state.

0b00  Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01  If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure EL1 are masked.
0b10  If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked.
If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure EL1 are masked.

0b11  If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked.
If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

**Note**
All interrupts includes virtual and SError interrupts.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:
- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

**TDA, bit [21]**
Traps accesses to the following debug System registers:
- AArch64: DBGBCR<\n>_EL1, DBGBVR<\n>_EL1, DBGWCR<\n>_EL1, DBGWVR<\n>_EL1.
- AArch32: DBGBCR<\n>, DBGBVR<\n>, DBGBXVR<\n>, DBGWCR<\n>, DBGWVR<\n>.

0b0  Accesses to debug System registers do not generate a Software Access Debug event.
0b1  Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

**MA, bit [20]**
Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:
- 0b0  Normal access mode.
- 0b1  Memory access mode.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

**SC2, bit [19]**
*When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:*
Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

0b0  Sample VTTBR_EL2.VMID.
0b1  Sample CONTEXTIDR_EL2.
The reset behavior of this field is:
  • On a Cold reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**NS, bit [18]**

*When FEAT_RME is implemented:*
Non-secure status. Together with the NSE field, gives the current Security state:

<table>
<thead>
<tr>
<th>NSE</th>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Realm.</td>
</tr>
</tbody>
</table>

Accessing this field has the following behavior:
  • When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
  • Otherwise, access to this field is RO

**Otherwise:**
Non-secure status. In Debug state, gives the current Security state:
0b0 Secure state.
0b1 Non-secure state.

Accessing this field has the following behavior:
  • When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
  • Otherwise, access to this field is RO

**Bit [17]**
Reserved, RES0.

**SDD, bit [16]**

*When FEAT_RME is implemented:*
EL3 debug disabled.
On entry to Debug state:
  • If entering from EL3, SDD is set to 0.
  • Otherwise, SDD is set to the inverse of ExternalRootInvasiveDebugEnabled ()

In Debug state, the value of SDD does not change, even if ExternalRootInvasiveDebugEnabled () changes.
In Non-debug state, SDD returns the inverse of ExternalRootInvasiveDebugEnabled ().

Access to this field is RO.

**Otherwise:**
Secure debug disabled.
On entry to Debug state:
  • If entering in Secure state, SDD is set to 0.
  • If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled ().
In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:
- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is RO.

NSE, bit [15]

*When FEAT_RME is implemented:*
Together with the NS field, this field gives the current Security state.
For a description of the values derived by evaluating NS and NSE together, see EDSCR.NS.

In Non-debug state, this bit is UNKNOWN.
Access to this field is RO.

*Otherwise:*
Reserved, RES0.

HDE, bit [14]
Halting debug enable.
0b0 Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1 Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.
The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

RW, bits [13:10]
Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

0b1111 Any of the following:
- The PE is in Non-debug state.
- The PE is at EL0 using AArch64.
- The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64.

0b1110 When AArch32 is supported:
The PE is in Debug state at EL0. EL0 is using AArch32. EL1, EL2, and EL3 are using AArch64.

0b110x When AArch32 is supported and EL2 is implemented:
The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.

0b10xx When AArch32 is supported and EL3 is implemented:
The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.

0b0xxx When AArch32 is supported:
The PE is in Debug state. All Exception levels are using AArch32.

Accessing this field has the following behavior:
- When the PE is in Non-debug state, access to this field is RAO/WI.
- Otherwise, access to this field is RO.
EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is RAZ/WI.
- Otherwise, access to this field is RO

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If $HCR_{EL2}.\{AMO, TGE\} = \{1, 0\}$, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

0b0 No SError interrupt pending.
0b1 SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is RO.

STATUS, bits [5:0]

Debug status flags.

0b000001 PE is restarting, exiting Debug state.
0b000010 PE is in Non-debug state.
0b000111 Breakpoint.
0b010011 External debug request.
0b011011 Halting step, normal.
0b011111 Halting step, exclusive.
0b100011 OS Unlock Catch.
0b101111 HLT instruction.
0b110011 Reset Catch.
0b101011 Watchpoint.
0b111111 Software access to debug register.
0b110111 Exception Catch.
0b111011 Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is RO.
**Accessing the EDSCR:**

EDSCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x88</td>
<td>EDSCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

**Purpose**
Contains sampled values captured on reading EDPCSR[31:0].

**Configurations**
EDVIDSR is in the Core power domain.
This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.
If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.
Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.
When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

**Note**
FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**
EDVIDSR is a 32-bit register.

**Field descriptions**

*When FEAT_VHE is not implemented or EDSCR.SC2 == 0:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>NS</td>
<td>Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.</td>
</tr>
<tr>
<td>30</td>
<td>EZ</td>
<td>Non-secure state. Indicates whether the most recent EDPCSR sample was associated with EL2.</td>
</tr>
<tr>
<td>29</td>
<td>E3</td>
<td>Non-secure state. Indicates whether the most recent EDPCSR sample was associated with EL2.</td>
</tr>
<tr>
<td>28</td>
<td>HV</td>
<td>High Voltage</td>
</tr>
<tr>
<td>27</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>16</td>
<td>VMID[15:8]</td>
<td>VMID</td>
</tr>
<tr>
<td>15</td>
<td>VMID</td>
<td>VMID</td>
</tr>
<tr>
<td>8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>

<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This format applies in all Armv8.0 implementations.

**NS, bit [31]**
Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.
If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

*0b0* Sample is from Secure state.

*0b1* Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E2, bit [30]**

*When EL2 is implemented:*
Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

*0b0* Sample is not from EL2.

*0b1* Sample is from EL2.
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**E3, bit [29]**

*When EL3 is implemented and AArch64 is supported:*

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

- 0b0 Sample is not from EL3 using AArch64.
- 0b1 Sample is from EL3 using AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**HV, bit [28]**

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

- 0b0 Bits[63:32] of the most recent EDPCSR sample are zero.
- 0b1 Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:16]**

Reserved, RES0.

**VMID[15:8], bits [15:8]**

*When FEAT_VMID16 is implemented and EL2 is implemented:*

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**VMID, bits [7:0]**

*When EL2 is implemented:*

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
— If EL2 is using AArch64, `FEAT_VMID16` is implemented, and `VTCR_EL2.VS` is 0, `PMVIDSR.VMID[7:0]` is set to `VTTBR_EL2.VMID[7:0]` and `PMVIDSR.VMID[15:8]` is `RES0`.

— If EL2 is using AArch32, this field is set to `VTTBR.VMID`.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, `RES0`.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:

### CONTEXTIDR_EL2

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXTIDR_EL2</td>
<td></td>
</tr>
</tbody>
</table>

Context ID. The value of `CONTEXTIDR_EL2` that is associated with the most recent `EDPCSR` sample. When the most recent `EDPCSR` sample is generated:

• If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from `CONTEXTIDR_EL2`.

• Otherwise, this field is set to an `UNKNOWN` value.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally `UNKNOWN` value.

Accessing the EDVIDSR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register `UNKNOWN`, see Permitted behavior that might make the PC Sample-based profiling registers `UNKNOWN` on page H7-10354.

EDVIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A8</td>
<td>EDVIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()` accesses to this register are RO.

• Otherwise accesses to this register generate an error response.
H9.2.45  EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configurations

EDWAR is in the Core power domain.

Attributes

EDWAR is a 64-bit register.

Field descriptions

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits</td>
</tr>
<tr>
<td>[63:0]</td>
</tr>
</tbody>
</table>

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See Determining the memory location that caused a Watchpoint exception on page D2-4734.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDWAR:

EDWAR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x030</td>
<td>EDWAR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDWAR[31:0] are RO.
- Otherwise accesses to EDWAR[31:0] generate an error response.

EDWAR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x034</td>
<td>EDWAR</td>
<td>63:32</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDWAR[63:32] are RO.
- Otherwise accesses to EDWAR[63:32] generate an error response.
H9.2.46 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configurations**

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

**Attributes**

MIDR_EL1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>28 [23]</th>
<th>20 [19]</th>
<th>16 [15]</th>
<th>4</th>
<th>3</th>
<th>0</th>
<th>Architecture</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementer</td>
<td>Variant</td>
<td>PartNum</td>
<td>Revision</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

- 0x00: Reserved for software use.
- 0x41: Arm Limited.
- 0x42: Broadcom Corporation.
- 0x43: Cavium Inc.
- 0x44: Digital Equipment Corporation.
- 0x46: Fujitsu Ltd.
- 0x49: Infineon Technologies AG.
- 0x4D: Motorola or Freescale Semiconductor Inc.
- 0x4E: NVIDIA Corporation.
- 0x50: Applied Micro Circuits Corporation.
- 0x51: Qualcomm Inc.
- 0x56: Marvell International Ltd.
- 0x69: Intel Corporation.
- 0xC0: Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version. Defined values are:

- `0b0001` Armv4.
- `0b0010` Armv4T.
- `0b0011` Armv5 (obsolete).
- `0b0100` Armv5T.
- `0b0101` Armv5TE.
- `0b0110` Armv5TEJ.
- `0b0111` Armv6.
- `0b1111` Architectural features are individually identified in the ID_* registers.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are `0x0` or `0x7`, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the MIDR_EL1:

MIDR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x00</td>
<td>MIDR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
**H9.2.47 OSLAR_EL1, OS Lock Access Register**

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS Lock.

**Configurations**

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

OSLAR_EL1 is in the Core power domain.

The OS Lock can also be locked or unlocked using DBGOSLR.

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

**Attributes**

OSLAR_EL1 is a 32-bit register.

**Field descriptions**

![Field Description Diagram]

**Bits [31:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use EDPRSR.OSLK to check the current status of the lock.

**Accessing the OSLAR_EL1:**

______ Note _______

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x300</td>
<td>OSLAR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are WO.
• When IsCorePowered(), !DoubleLockStatus(), !AllowExternalDebugAccess() and FEAT_Debugv8p2 is not implemented accesses to this register are IMPDEF.

• Otherwise accesses to this register generate an error response.
H9.3 **External trace registers**

This section lists the external Trace unit registers.
H9.3.1 TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures
the context type, Exception levels, alignment, masking that is applied by the Address Comparator,
and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configurations

External register TRCACATR<n> bits [63:0] are architecturally mapped to AArch64 System
register TRCACATR<n>[63:0].

This register is present only when FEAT_ETE is implemented and
UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACATR<n> are RES0.

Attributes

TRCACATR<n> is a 64-bit register.

Field descriptions

Bits [63:19]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [18]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm
state.

0b0 When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs
comparisons in Realm EL2.
When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not
perform comparisons in Realm EL2.

0b1 When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not
perform comparisons in Realm EL2.
When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs
comparisons in Realm EL2.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EXLEVEL_RL_EL1, bit [17]

When TRCIDR6.EXLEVEL_RL_EL1 == 1:

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

\[0b0\] When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1.
When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.

\[0b1\] When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1.
When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]

When TRCIDR6.EXLEVEL_RL_EL0 == 1:

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

\[0b0\] When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0.
When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.

\[0b1\] When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0.
When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]

When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

\[0b0\] The Address Comparator performs comparisons in Non-secure EL2.
\[0b1\] The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EXLEVEL_NS_EL1, bit [13]

When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

0b0 The Address Comparator performs comparisons in Non-secure EL1.
0b1 The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]

When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

0b0 The Address Comparator performs comparisons in Non-secure EL0.
0b1 The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL3, bit [11]

When EL3 is implemented:

EL3 address comparison control. Controls whether a comparison can occur at EL3.

0b0 The Address Comparator performs comparisons in EL3.
0b1 The Address Comparator does not perform comparisons in EL3.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL2, bit [10]

When EL2 is implemented and FEAT_SEL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

0b0 The Address Comparator performs comparisons in Secure EL2.
0b1 The Address Comparator does not perform comparisons in Secure EL2.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL1, bit [9]

When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

0b0 The Address Comparator performs comparisons in Secure EL1.
The Address Comparator does not perform comparisons in Secure EL1.
The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKOWN value.

**Otherwise:**
Reserved, RES0.

**EXLEVEL_S_EL0, bit [8]**

*When Secure EL0 is implemented:*
Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

- **0b0** The Address Comparator performs comparisons in Secure EL0.
- **0b1** The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKOWN value.

**Otherwise:**
Reserved, RES0.

**Bit [7]**
Reserved, RES0.

**CONTEXT, bits [6:4]**

*When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:*
Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

- **0b000** Comparator 0.
- **0b001** *When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1:*
  Comparator 1.
- **0b010** *When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2:*
  Comparator 2.
- **0b011** *When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3:*
  Comparator 3.
- **0b100** *When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4:*
  Comparator 4.
- **0b101** *When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5:*
  Comparator 5.
- **0b110** *When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6:*
  Comparator 6.
- **0b111** *When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7:*
  Comparator 7.

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKOWN value.

**Otherwise:**
Reserved, RES0.
CONTEXTTYPE, bits [3:2]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

0b00 When TRCIDR4.NUMCIDC != 0b0000:
The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.

0b01 When TRCIDR4.NUMCIDC != 0b0000:
The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.

0b10 When TRCIDR4.NUMVMIDC != 0b0000:
The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.

0b11 When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000:
The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.
If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [1:0]
Reserved, RES0.

Accessing the TRCACATR<n>: 
Must be programmed if any of the following are true:

• TRCBBCTRL.RANGE[n/2] == 1.
• TRCRSCTRL<n>.GROUP == 0b0100 and TRCRSCTRL<n>.SAC[n] == 1.
• TRCRSCTRL<n>.GROUP == 0b0101 and TRCRSCTRL<n>.ARC[n/2] == 1.
• TRCVIIECTRL.EXCLUDE[n/2] == 1.
• TRCVIIECTRL.INCLUDE[n/2] == 1.
• TRCVISSCTRL.START[n] == 1.
• TRCVISSCTRL.STOP[n] == 1.
• TRCSSCCR<>.ARC[n/2] == 1.
• TRCSSCCR<>.SAC[n] == 1.
• TRCQCTRL.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
TRCACATR<\textit{n}> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>$0x480 + (8 \times n)$</td>
<td>TRCACATR&lt;\textit{n}&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.2 TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

**Purpose**
Contains the address value.

**Configurations**
External register TRCACVR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCACVR<n>[63:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACVR<n> are RES0.

**Attributes**
TRCACVR<n> is a 64-bit register.

**Field descriptions**

ADDRESS, bits [63:0]
Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then
the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the
PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always
programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an
UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value,
and a read of the register returns the written value.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCACVR<n>:**
Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<n>.GROUP == 0b0100 and TRCRSCTLR<n>.SAC[n] == 1.
- TRCRSCTLR<n>.GROUP == 0b0101 and TRCRSCTLR<n>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.
- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
• TRCVISSCTRL.STOP[n] == 1.
• TRCSSCCR<>.ARC[n/2] == 1.
• TRCSSCCR<>.SAC[n] == 1.
• TRCQCTRL.RANGE[n/2] == 1.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

TRCACVR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x400 + (8 * n)</td>
<td>TRCACVR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
H9.3.3 TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configurations

External register TRCAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register TRCAUTHSTATUS[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are RES0.

Attributes

TRCAUTHSTATUS is a 32-bit register.

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

0b00 Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

0b00 Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

0b00 Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.

0b10 Implemented and disabled.

0b11 Implemented and enabled.
All other values are reserved.
This field reads as 0b00.

**HID, bits [9:8]**

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

- 0b00: Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
- 0b10: Implemented and disabled.
- 0b11: Implemented and enabled.

All other values are reserved.
This field reads as 0b00.

**SNID, bits [7:6]**

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

- 0b00: Secure non-invasive debug features not implemented.
- 0b10: Implemented and disabled.
- 0b11: Implemented and enabled.

All other values are reserved.
When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.
When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.
When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

**SID, bits [5:4]**

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

- 0b00: Secure invasive debug features not implemented.
- 0b10: Implemented and disabled.
- 0b11: Implemented and enabled.

All other values are reserved.
This field reads as 0b00.

**NSNID, bits [3:2]**

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

- 0b00: Non-secure non-invasive debug features not implemented.
- 0b10: Implemented and disabled.
- 0b11: Implemented and enabled.

All other values are reserved.
When EL3 is implemented, this field reads as 0b11.
When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.
When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

**NSID, bits [1:0]**

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

- 0b00: Non-secure invasive debug features not implemented.
0b10 Implemented and disabled.
0b11 Implemented and enabled.
All other values are reserved.
This field reads as 0b00.

**Accessing the TRCAUTHSTATUS:**

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

External debugger accesses to this register are unaffected by the OS Lock.

TRCAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xF8</td>
<td>TRCAUTHSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.4 TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose
The function of this register is IMPLEMENTATION DEFINED.

Configurations
External register TRCAUXCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCAUXCTLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUXCTLR are RES0.

Attributes
TRCAUXCTLR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.
This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to 0.

Accessing the TRCAUXCTLR:
If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

TRCAUXCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x018</td>
<td>TRCAUXCTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
H9.3.5 TRCBBCTRLR, Branch Broadcast Control Register

The TRCBBCTRLR characteristics are:

**Purpose**

Controls the regions in the memory map where branch broadcasting is active.

**Configurations**

External register TRCBBCTRLR bits [31:0] are architecturally mapped to AArch64 System register TRCBBCTRLR[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR0.TRCBB == 1 and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTRLR are RES0.

**Attributes**

TRCBBCTRLR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-9</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>MODE, bit [8]</td>
<td></td>
</tr>
<tr>
<td>7-0</td>
<td>RANGE[m], for m = 7 to 0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:9]**

Reserved, RES0.

**MODE, bit [8]**

Mode.

0b0  Exclude Mode.

Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTRLR.RANGE.

If TRCBBCTRLR.RANGE == 0x00 then branch broadcasting is active for all instructions.

0b1  Include Mode.

Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTRLR.RANGE.

If TRCBBCTRLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE[m], bit [m], for m = 7 to 0**

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

0b0  The address range that Address Range Comparator <m> defines, is not selected.

0b1  The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCBBCTLRL:**

Must be programmed if TRCCONFIGR.BB == 1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

TRCBBCTLRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x03C</td>
<td>TRCBBCTLRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

- Otherwise accesses to this register are RW.
H9.3.6  TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose
Set the threshold value for cycle counting.

Configurations
External register TRCCCCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCCCCTLR[31:0].
This register is present only when FEAT_ETE is implemented and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are RES0.

Attributes
TRCCCCTLR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>31-12</td>
</tr>
<tr>
<td>THRESHOLD</td>
<td>11-0</td>
</tr>
</tbody>
</table>

Bits [31:12]
Reserved, RES0.

THRESHOLD, bits [11:0]
Sets the threshold value for instruction trace cycle counting.
The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.
Writing a value of zero when TRCCONFIGR.CCI enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCCCTLR:
Must be programmed if TRCCONFIGR.CCI == 1.
Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCCCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x038</td>
<td>TRCCCCTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
H9.3.7 TRCCIDCCTRL0, Context Identifier Comparator Control Register 0

The TRCCIDCCTRL0 characteristics are:

**Purpose**

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

**Configurations**

External register TRCCIDCCTRL0 bits [31:0] are architecturally mapped to AArch64 System register TRCCIDCCTRL0[31:0].

This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMCIDC) > 0x0 and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTRL0 are RES0.

**Attributes**

TRCCIDCCTRL0 is a 32-bit register.

**Field descriptions**

```
<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>24</th>
<th>16</th>
<th>15</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP3[&lt;m&gt;]</td>
<td>COMP2[&lt;m&gt;]</td>
<td>COMP1[&lt;m&gt;]</td>
<td>COMP0[&lt;m&gt;]</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**COMP3[<m>], bit [m+24], for m = 7 to 0**

*When UInt(TRCIDR4.NUMCIDC) > 3:*

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

- **0b0** The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
- **0b1** The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COMP2[<m>], bit [m+16], for m = 7 to 0**

*When UInt(TRCIDR4.NUMCIDC) > 2:*

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

- **0b0** The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
- **0b1** The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COMP1[<m>], bit [m+8], for m = 7 to 0**

*When UInt(TRCIDR4.NUMCIDC) > 1:*

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

- **0b0** The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP0[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 0:
TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing the TRCCIDCCTRL0:

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTRL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x680</td>
<td>TRCCIDCCTRL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
### H9.3.8 TRCCIDCCTRL1, Context Identifier Comparator Control Register 1

The TRCCIDCCTRL1 characteristics are:

**Purpose**

Contains Context identifier mask values for the TRCCIDCVR\(<n>\) registers, for \(n = 4\) to \(7\).

**Configurations**

External register TRCCIDCCTRL1 bits [31:0] are architecturally mapped to AArch64 System register TRCCIDCCTRL1\[31:0\].

This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMCIDC) > 0x4 and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTRL1 are RES0.

**Attributes**

TRCCIDCCTRL1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP7(&lt;m&gt;), bit [m+24], for m = 7 to 0</td>
</tr>
</tbody>
</table>

*When UInt(TRCIDR4.NUMCIDC) > 7:*

- TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

  \- 0b0 The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

  \- 0b1 The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

- This bit is RES0 if m >= TRCIDR2.CIDSIZE.

  The reset behavior of this field is:

  - On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

<table>
<thead>
<tr>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP6(&lt;m&gt;), bit [m+16], for m = 7 to 0</td>
</tr>
</tbody>
</table>

*When UInt(TRCIDR4.NUMCIDC) > 6:*

- TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

  \- 0b0 The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

  \- 0b1 The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

- This bit is RES0 if m >= TRCIDR2.CIDSIZE.

  The reset behavior of this field is:

  - On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

<table>
<thead>
<tr>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP5(&lt;m&gt;), bit [m+8], for m = 7 to 0</td>
</tr>
</tbody>
</table>

*When UInt(TRCIDR4.NUMCIDC) > 5:*

- TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

  \- 0b0 The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1 The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP4[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4,NUMCIDC) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

0b0 The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

0b1 The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCIDCCTLR1:

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

 Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTLR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x684</td>
<td>TRCCIDCCTLR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

• Otherwise accesses to this register are RW.
H9.3.9 TRCCIDCVR<\text{n}>, Context Identifier Comparator Value Registers <\text{n}>, n = 0 - 7

The TRCCIDCVR<\text{n}> characteristics are:

**Purpose**

Contains a Context identifier value.

**Configurations**

External register TRCCIDCVR<\text{n}> bits [63:0] are architecturally mapped to AArch64 System register TRCCIDCVR<\text{n}>[63:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMCIDC) > \text{n}. Otherwise, direct accesses to TRCCIDCVR<\text{n}> are RES0.

**Attributes**

TRCCIDCVR<\text{n}> is a 64-bit register.

**Field descriptions**

![Field descriptions diagram]

**VALUE**, bits [63:0]

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCIDCVR<\text{n}>:**

Must be programmed if any of the following are true:

- TRCRSCTLR<\text{n}>,GROUP == 0b0110 and TRCRSCTLR<\text{n}>,CID[\text{n}] == 1.
- TRCACATR<\text{n}>,CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<\text{n}>,CONTEXT == \text{n}.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCVR<\text{n}> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x600 + (8 * \text{n})</td>
<td>TRCCIDCVR&lt;\text{n}&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.10 TRCCIDR0, Component Identification Register 0

The TRCCIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR0 are RES0.

**Attributes**

TRCCIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>00001101</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRMBL_0, bits [7:0]</td>
<td>00001101</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.
Reads as 0x0D.
Access to this field is RO.

**Accessing the TRCCIDR0:**

External debugger accesses to this register are unaffected by the OS Lock.
TRCCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFF0</td>
<td>TRCCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.11 TRCCIDR1, Component Identification Register 1

The TRCCIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR1 are RES0.

**Attributes**

TRCCIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:4</td>
<td>CLASS, component class.</td>
</tr>
<tr>
<td>0b1001</td>
<td>CoreSight peripheral. Other values are defined by the CoreSight Architecture. This field reads as 0x9.</td>
</tr>
<tr>
<td>3:0</td>
<td>PRMBL_1, component identification preamble, segment 1. Reads as 0b0000. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the TRCCIDR1:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFF4</td>
<td>TRCCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.12 TRCCIDR2, Component Identification Register 2

The TRCCIDR2 characteristics are:

**Purpose**

Provides discovery information about the component. 
For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR2 are RES0.

**Attributes**

TRCCIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved</td>
<td>RES0</td>
</tr>
<tr>
<td>[7:0]</td>
<td>PRMBL_2</td>
<td>0x05</td>
</tr>
</tbody>
</table>

Access to this field is RO.

**Accessing the TRCCIDR2:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFF8</td>
<td>TRCCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.13   TRCCIDR3, Component Identification Register 3

The TRCCIDR3 characteristics are:

**Purpose**

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR3 are RES0.

**Attributes**

TRCCIDR3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Field</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0</td>
<td>RES0</td>
</tr>
<tr>
<td>[7:0]</td>
<td>PRMBL_3, Component identification preamble, segment 3.</td>
<td>0xB1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Component identification preamble, segment 3.
Reads as 0xB1.
Access to this field is RO.

**Accessing the TRCCIDR3:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFFF</td>
<td>TRCCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.14  TRCCLAIMCLR, Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

**Purpose**

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMCLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are RES0.

**Attributes**

TRCCLAIMCLR is a 32-bit register.

**Field descriptions**

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

- **0b0**  On a read: Claim Tag bit <m> is not set.
  On a write: Ignored.

- **0b1**  On a read: Claim Tag bit <m> is set.
  On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Access to this field is W1C.
Accessing the TRCCLAIMCLR:

TRCCLAIMCLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFA4</td>
<td>TRCCLAIMCLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.15 TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

**Purpose**

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMSET[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are RES0.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

**Attributes**

TRCCLAIMSET is a 32-bit register.

**Field descriptions**

```
SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

0b0   On a read: Claim Tag bit <m> is not implemented.
     On a write: Ignored.

0b1   On a read: Claim Tag bit <m> is implemented.
     On a write: Set Claim Tag bit <m> to 1.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.
Access to this field is RAO/W1S.
```
Accessing the TRCCLAIMSET:

TRCCLAIMSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFA0</td>
<td>TRCCLAIMSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.16 TRCCNTCTLR<n>, Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

**Purpose**
Controls the operation of Counter <n>.

**Configurations**
External register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTCTLR<n> are RES0.

**Attributes**
TRCCNTCTLR<n> is a 32-bit register.

**Field descriptions**

![Register Diagram]

**Bits [31:18]**
- **Reserved, RES0.**

**CNTCHAIN, bit [17]**
For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

- **0b0** The Counter does not decrement when a reload event for Counter <n-1> occurs.
- **0b1** Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value.

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RLDSELF, bit [16]**
Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

- **0b0** Normal mode.
  - The Counter is in Normal mode.

- **0b1** Self-reload mode.
  - The Counter is in Self-reload mode.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RLDEVENT_TYPE, bit [15]**
Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

- **0b0** A single Resource Selector.
  - TRCCNTCTLR<n>.RLDEVENT_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
A Boolean-combined pair of Resource Selectors.

TRCCNTCTLR<\text{n}>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<\text{n}>.RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [14:13]**

Reserved, RES0.

**RLDEVENT_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors.

TRCCNTCTLR<\text{n}>.RLDEVENT.TYPE controls whether TRCCNTCTLR<\text{n}>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter \(<\text{n}>\).

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**CNTEVENT_TYPE, bit [7]**

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter \(<\text{n}>\) to decrement.

- **0b0** A single Resource Selector.
  
  TRCCNTCTLR<\text{n}>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

- **0b1** A Boolean-combined pair of Resource Selectors.
  
  TRCCNTCTLR<\text{n}>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<\text{n}>.CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**CNTEVENT_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors.

TRCCNTCTLR<\text{n}>.CNTEVENT.TYPE controls whether TRCCNTCTLR<\text{n}>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter \(<\text{n}>\) to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Accessing the TRCCNTCTRL<n>:

Must be programmed if \( \text{TRCRSCTRL}<n> \).GROUP == 0b0010 and \( \text{TRCRSCTRL}<n> \).COUNTERS\[n\] == 1.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

TRCCNTCTRL<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x150 + (4 * n)</td>
<td>TRCCNTCTRL&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.17 TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

**Purpose**

This sets or returns the reload count value for Counter <n>.

**Configurations**

External register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTRLDVR<n>[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are RES0.

**Attributes**

TRCCNTRLDVR<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:16]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[15:0]</td>
<td>VALUE, bits [15:0]</td>
</tr>
</tbody>
</table>

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCNTRLDVR<n>:**

Must be programmed if TRCRSCTLR<n>.GROUP == 0b0010 and TRCRSCTLR<n>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTRLDVR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x140 + (4 * n)</td>
<td>TRCCNTRLDVR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.18 TRCCNTVR<n>, Counter Value Register <n>, n = 0 - 3

The TRCCNTVR<n> characteristics are:

Purpose

This sets or returns the value of Counter <n>.

Configurations

External register TRCCNTVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTVR<n>[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTVR<n> are RES0.

Attributes

TRCCNTVR<n> is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VALUE</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the count value of Counter.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCNTVR<n>:

Must be programmed if TRCRSCTLR<n>.GROUP == 0b0010 and TRCRSCTLR<n>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCCNTVR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x160 + (4 * n)</td>
<td>TRCCNTVR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.19 TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

**Purpose**

Controls the tracing options.

**Configurations**

External register TRCCONFIGR bits [31:0] are architecturally mapped to AArch64 System register TRCCONFIG[R][31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCONFIGR are RES0.

**Attributes**

TRCCONFIGR is a 32-bit register.

**Field descriptions**

- **Bits [31:16]**
  - Reserved, RES0.
- **VMIDOPT, bit [15]**
  - When TRCIDR2.VMIDOPT == 0b01:
    - Virtual context identifier selection control.
    - 0b0 VTTBR_EL2.VMID is used as the Virtual context identifier.
    - 0b1 CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.
  - When TRCIDR2.VMIDOPT == 0b00:
    - Reserved, RES0.
  - Virtual context identifier selection control.
    - VTTBR_EL2.VMID is used as the Virtual context identifier.
  - When TRCIDR2.VMIDOPT == 0b10:
    - Reserved, RES1.
  - Virtual context identifier selection control.
    - CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.
- **Otherwise:**
  - Reserved, RES0.
- **QE, bits [14:13]**
  - When TRCIDR0.QSUPP == 0b01:
    - Q element generation control.
    - 0b0 Q elements are disabled.
    - 0b1 Q elements with instruction counts are enabled.
    - Q elements without instruction counts are disabled.
  - All other values are reserved.
When TRCIDR0.QSUPP == 0b10:
  Q element generation control.
  0b00 Q elements are disabled.
  0b11 Q elements with instruction counts are enabled.
  Q elements without instruction counts are enabled.
  All other values are reserved.

When TRCIDR0.QSUPP == 0b11:
  Q element generation control.
  0b00 Q elements are disabled.
  0b01 Q elements with instruction counts are enabled.
  Q elements without instruction counts are disabled.
  0b11 Q elements with instruction counts are enabled.
  Q elements without instruction counts are enabled.
  All other values are reserved.

Otherwise:
  Reserved, RES0.

RS, bit [12]
When TRCIDR0.RETSTACK == 1:
  Return stack control.
  0b0 Return stack is disabled.
  0b1 Return stack is enabled.
  The reset behavior of this field is:
  • On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
  Reserved, RES0.

TS, bit [11]
When TRCIDR0.TSSIZE != 0b00000:
  Global timestamp tracing control.
  0b0 Global timestamp tracing is disabled.
  0b1 Global timestamp tracing is enabled.
  The reset behavior of this field is:
  • On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
  Reserved, RES0.

Bits [10:8]
Reserved, RES0.

VMID, bit [7]
When TRCIDR2.VMIDSIZE != 0b00000:
  Virtual context identifier tracing control.
  0b0 Virtual context identifier tracing is disabled.
  0b1 Virtual context identifier tracing is enabled.
  The reset behavior of this field is:
  • On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

CID, bit [6]

When TRCIDR2.CIDSIZE != 0b00000:

Context identifier tracing control.

0b0   Context identifier tracing is disabled.
0b1   Context identifier tracing is enabled.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]

When TRCIDR0.TRCCCI == 1:

Cycle counting instruction tracing control.

0b0   Cycle counting instruction tracing is disabled.
0b1   Cycle counting instruction tracing is enabled.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]

When TRCIDR0.TRCBB == 1:

Branch broadcasting control.

0b0   Branch broadcasting is disabled.
0b1   Branch broadcasting is enabled.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing the TRCCONFIGR:

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
TRCCONFIGR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x10</td>
<td>TRCCONFIGR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
**H9.3.20 TRCDEVAFF, Device Affinity Register**

The TRCDEVAFF characteristics are:

**Purpose**

For additional information, see the CoreSight Architecture Specification.

Reads the same value as the MPIDR_EL1 register for the PE that this trace unit has affinity with.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVAFF are RES0.

**Attributes**

TRCDEVAFF is a 64-bit register.

**Field descriptions**

- **MPIDR_EL1, bits [63:0]**
  
  Read-only copy of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the TRCDEVAFF:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVAFF can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFA8</td>
<td>TRCDEVAFF</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.21 TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

**Configurations**

External register TRCDEVARCH bits [31:0] are architecturally mapped to AArch64 System register TRCDEVARCH[31:0].
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are RES0.

**Attributes**

TRCDEVARCH is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>21</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>REVISION</td>
<td>ARCHVER</td>
<td>ARCHPART</td>
<td>PRESENT</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

0b01000111011 JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.
Other values are defined by the JEDEC JEP106 standard.
This field reads as 0x23B.

**PRESENT, bit [20]**

DEVARCH Present. Defines that the DEVARCH register is present.

0b0 Device Architecture information not present.
0b1 Device Architecture information present.
This field reads as 1.

**REVISION, bits [19:16]**

Revision. Defines the architecture revision of the component.

0b0000 ETEv1.0, FEAT_ETE.
0b0001 ETEv1.1, FEAT_ETEv1p1.
0b0010 ETEv1.2, FEAT_ETEv1p2.
All other values are reserved.

**ARCHVER, bits [15:12]**

Architecture Version. Defines the architecture version of the component.

0b010 ETEv1.
ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].
This field reads as 0x5.
ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.
0xA13 Arm PE trace architecture.
ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].
This field reads as 0xA13.

**Accessing the TRCDEVARCH:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFBC</td>
<td>TRCDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.22 TRCDEVID, Device Configuration Register

The TRCDEVID characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

External register TRCDEVID bits [31:0] are architecturally mapped to AArch64 System register TRCDEVID[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID are RES0.

**Attributes**

TRCDEVID is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCDEVID:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFC8</td>
<td>TRCDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.23   TRCDEVID1, Device Configuration Register 1

The TRCDEVID1 characteristics are:

**Purpose**

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID1 are RES0.

**Attributes**

TRCDEVID1 is a 32-bit register.

**Field descriptions**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [31:0]

Reserved, RES0.

**Accessing the TRCDEVID1:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFc4</td>
<td>TRCDEVID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.24 TRCDEVID2, Device Configuration Register 2

The TRCDEVID2 characteristics are:

**Purpose**

Provides discovery information for the component. For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID2 are RES0.

**Attributes**

TRCDEVID2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>

**Accessing the TRCDEVID2:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xF0</td>
<td>TRCDEVID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.25 TRCDEVTYPE, Device Type Register

The TRCDEVTYPE characteristics are:

**Purpose**

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by TRCDEVTYPE about the component instead.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVTYPE are RES0.

**Attributes**

TRCDEVTYPE is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>6</th>
<th>0</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Component sub-type.

- **0b0001**: When MAJOR == 0x3 (Trace source): Associated with a PE. This field reads as 0x1.

**MAJOR, bits [3:0]**

Component major type.

- **0b0011**: Trace source. Other values are defined by the CoreSight Architecture. This field reads as 0x3.

**Accessing the TRCDEVTYPE:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFCC</td>
<td>TRCDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.26 TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configurations

External register TRCEVENTCTL0R bits [31:0] are architecturally mapped to AArch64 System register TRCEVENTCTL0R[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are RES0.

Attributes

TRCEVENTCTL0R is a 32-bit register.

Field descriptions

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

0b0 A single Resource Selector.

TRCEVENTCTL0R.EVENT3.TYPE[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

TRCEVENTCTL0R.EVENT3.TYPE[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.TYPE[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

 Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.
When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### EVENT2_TYPE, bit [23]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Chooses the type of Resource Selector.

- 0b0 A single Resource Selector. TRCEVENTCTL0R.EVENT2.TYPE selects the single Resource Selector, from 0-31, used to activate the resource event.

- 0b1 A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2_SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

### EVENT2_SEL, bits [20:16]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2_SEL controls whether TRCEVENTCTL0R.EVENT2_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### EVENT1_TYPE, bit [15]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

- 0b0 A single Resource Selector. TRCEVENTCTL0R.EVENT1_SEL[4] selects the single Resource Selector, from 0-31, used to activate the resource event.

- 0b1 A Boolean-combined pair of Resource Selectors.
TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]
Reserved, RES0.

EVENT1_SEL, bits [12:8]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Defines the selected Resource Selector or pair of Resource Selectors.

TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

0b0 A single Resource Selector.

TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]
Reserved, RES0.

EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors.

TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.
If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TRCEVENTCTL0R:**

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL0R can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x020</td>
<td>TRCEVENTCTL0R</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.27 TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

**Purpose**

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

**Configurations**

External register TRCEVENTCTL1R bits [31:0] are architecturally mapped to AArch64 System register TRCEVENTCTL1R[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are RES0.

**Attributes**

TRCEVENTCTL1R is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>LPOVERRIDE</td>
<td>Low-power Override Mode select.</td>
</tr>
<tr>
<td>12</td>
<td>When TRCIDR5.LPOVERRIDE == 1:</td>
<td>Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.</td>
</tr>
<tr>
<td>11</td>
<td>ATB</td>
<td>AMBA Trace Bus (ATB) trigger enable.</td>
</tr>
<tr>
<td></td>
<td>When TRCIDR5.ATBTRIG == 1:</td>
<td>AMBA Trace Bus (ATB) trigger enable.</td>
</tr>
</tbody>
</table>

When TRCIDR5.LPOVERRIDE == 1:

- **LPOVERRIDE**
  - **0b0**: Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
  - **0b1**: Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

When TRCIDR5.ATBTRIG == 1:

- **ATB**
  - AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- **ATID** = 0x7D.
- **ATDATA** to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.
If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

- 0b0: ATB trigger is disabled.
- 0b1: ATB trigger is enabled.

**Otherwise:**
- Reserved, RES0.

**Bits [10:4]**
- Reserved, RES0.

**INSTEN[_m_], bit [m], for m = 3 to 0**
- Event element control.
  - 0b0: The trace unit does not generate an Event element <m>.
  - 0b1: The trace unit generates an Event element <m>.

This bit is RES0 if m >= the number indicated by TRCIDR0.NUMEVENT.

**Accessing the TRCEVENTCTL1R:**

Must be programmed.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

TRCEVENTCTL1R can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x824</td>
<td>TRCEVENTCTL1R</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSlockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.28 TRCEXTINSELR<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

**Purpose**

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

**Configurations**

External register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCEXTINSELR<n>[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR5.NUMEXTINSEL) > n. Otherwise, direct accesses to TRCEXTINSELR<n> are RES0.

**Attributes**

TRCEXTINSELR<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>evtCount</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00FF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Accessing the TRCEXTINSELR\langle n\rangle:

Must be programmed if any of the following is true: TRCRSCTRLR\langle n\rangle.GROUP == 0b0000 and TRCRSCTRLR\langle n\rangle.EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEXTINSELR\langle n\rangle can be accessed through the external debug interface:

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x120 + (4 \times n)</td>
<td>TRCEXTINSELR\langle n\rangle</td>
</tr>
</tbody>
</table>
H9.3.29 TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR0[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR0 are RES0.

**Attributes**

TRCIDR0 is a 32-bit register.

**Field descriptions**

![Diagram of TRCIDR0 register]

**Bit [31]**

Reserved, RES0.

**COMMTRANS, bit [30]**

Transaction Start element behavior.

- 0b0: Transaction Start elements are P0 elements.
- 0b1: Transaction Start elements are not P0 elements.

**COMMOPT, bit [29]**

Indicates the contents and encodings of Cycle count packets.

- 0b0: Commit mode 0.
- 0b1: Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- RAO/WI if all of the following are true:
  - TRCIDR0.TRCCCI == 1
  - UInt(TRCIDR8.MAXSPEC) == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is RAZ/WI.
- Otherwise, access to this field is RO
TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

- **0b00000**: Global timestamping not implemented.
- **0b01000**: Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as **0b01000**.

TSMARK, bit [23]

*When FEAT_ETEv1p1 is implemented:*

Indicates whether Timestamp Marker elements are generated.

- **0b0**: Timestamp Marker elements are not generated.
- **0b1**: Timestamp Marker elements are generated.

*Otherwise:*

Reserved, RES0.

Bits [22:18]

Reserved, RES0.

TRCEXDATA, bit [17]

*When TRCIDR0.TRCDATA != 0b00:*

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

- **0b0**: Tracing of data transfers for exceptions and exception returns not implemented.
- **0b1**: Tracing of data transfers for exceptions and exception returns implemented.

*Otherwise:*

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

- **0b00**: Q element support is not implemented.
- **0b01**: Q element support is implemented, and only supports Q elements with instruction counts.
- **0b10**: Q element support is implemented, and only supports Q elements without instruction counts.
- **0b11**: Q element support is implemented, and supports:
  - Q elements with instruction counts.
  - Q elements without instruction counts.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

- **0b0**: Q element filtering is not implemented.
- **0b1**: Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.
CONDTYPE, bits [13:12]

When TRCIDR0.TRCCOND == 1:
Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

0b00  Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01  Conditional instructions are traced with an indication of the APSR condition flags.
All other values are reserved.

Otherwise:
Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:
Indicates the number of ETEEvents implemented.
0b00  The trace unit supports 0 ETEEvents.
All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:
Indicates the number of ETEEvents implemented.
0b00  The trace unit supports 1 ETEEvent.
0b01  The trace unit supports 2 ETEEvents.
0b10  The trace unit supports 3 ETEEvents.
0b11  The trace unit supports 4 ETEEvents.

Otherwise:
Reserved, RES0.

RETSTACK, bit [9]
Indicates if the trace unit supports the return stack.
0b0  Return stack not implemented.
0b1  Return stack implemented.

Bit [8]
Reserved, RES0.

TRCCCI, bit [7]
Indicates if the trace unit implements cycle counting.
0b0  Cycle counting not implemented.
0b1  Cycle counting implemented.
This field reads as 1.

TRCCOND, bit [6]
Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.
0b0  Conditional instruction tracing not implemented.
0b1  Conditional instruction tracing implemented.
This field reads as 0.

TRCBB, bit [5]
Indicates if the trace unit implements branch broadcasting.
0b0  Branch broadcasting not implemented.
0b1       Branch broadcasting implemented.
This field reads as 1.

**TRCDATA, bits [4:3]**
Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this
field is reserved for other trace architectures.
0b00       Data tracing not implemented.
0b11       Data tracing implemented.
All other values are reserved.
This field reads as 0b00.

**INSTP0, bits [2:1]**
Indicates if load and store instructions are P0 instructions. Load and store instructions as P0
instructions is not implemented in ETE and this field is reserved for other trace architectures.
0b00       Load and store instructions are not P0 instructions.
0b11       Load and store instructions are P0 instructions.
All other values are reserved.
This field reads as 0b00.

**Bit [0]**
Reserved, RES1.

**Accessing the TRCIDR0:**
TRCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1E0</td>
<td>TRCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.30 TRCIDR1, ID Register 1

The TRCIDR1 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR1 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR1[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR1 are RES0.

**Attributes**

TRCIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>

**DESIGNER, bits [31:24]**

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1.Implementer.

**Bits [23:16]**

Reserved, RES0.

**Bits [15:12]**

Reserved, RES1.

**TRCARCHMAJ, bits [11:8]**

Major architecture version.

0b1111 If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

**TRCARCHMIN, bits [7:4]**

Minor architecture version.

0b1111 If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

**REVISION, bits [3:0]**

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.
**Accessing the TRCIDR1:**

TRCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1E4</td>
<td>TRCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.31 TRCIDR10, ID Register 10

The TRCIDR10 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configurations

External register TRCIDR10 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR10[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR10 are RES0.

Attributes

TRCIDR10 is a 32-bit register.

Field descriptions

NUMP1KEY, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing the TRCIDR10:

TRCIDR10 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x188</td>
<td>TRCIDR10</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.32 TRCIDR11, ID Register 11

The TRCIDR11 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR11 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR11[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR11 are RES0.

**Attributes**

TRCIDR11 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMP1SPC</td>
<td>bits [31:0]</td>
</tr>
</tbody>
</table>

When TRCIDR0.TRCDATA ! = 0b00:

Indicates the number of special P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

**Accessing the TRCIDR11:**

TRCIDR11 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x18C</td>
<td>TRCIDR11</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.33 TRCIDR12, ID Register 12

The TRCIDR12 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR12 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR12[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR12 are RES0.

**Attributes**

TRCIDR12 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th></th>
<th>NUMCONDKEY</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

NUMCONDKEY, bits [31:0]

*When TRCIDR0.TRCCOND == 1:*

Indicates the number of conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

*Otherwise:*

Reserved, RES0.

**Accessing the TRCIDR12:**

TRCIDR12 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x190</td>
<td>TRCIDR12</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.34 TRCIDR13, ID Register 13

The TRCIDR13 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR13 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR13[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR13 are RES0.

**Attributes**

TRCIDR13 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMCONDSPC</td>
<td>Indicates the number of special conditional instruction right-hand keys.</td>
</tr>
<tr>
<td></td>
<td>Conditional instruction tracing is not implemented in ETE and this field is</td>
</tr>
<tr>
<td></td>
<td>reserved for other trace architectures. Allocated in other trace architectures.</td>
</tr>
</tbody>
</table>

When TRCIDR0.TRCCOND == 1:

Indicates the number of special conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

**Otherwise:**

Reserved, RES0.

**Accessing the TRCIDR13:**

TRCIDR13 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x194</td>
<td>TRCIDR13</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.35   TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configurations

External register TRCIDR2 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR2[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR2 are RES0.

Attributes

TRCIDR2 is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| WFXMODE | VMIDOPT |

WFXMODE, bit [31]

Indicates whether WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions:

- 0b0: WFI, WFIT, WFE, and WFET instructions are not classified as P0 instructions.
- 0b1: WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

- 0b00: Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.
- 0b01: Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.
- 0b10: Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b00000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b00000 then this field is 0b10.

CCSIZE, bits [28:25]

Indicates the size of the cycle counter.

When TRCIDR0.TRCCCI == 1:

- 0b0000: The cycle counter is 12 bits in length.
- 0b0001: The cycle counter is 13 bits in length.
- 0b0010: The cycle counter is 14 bits in length.
- 0b0011: The cycle counter is 15 bits in length.
- 0b0100: The cycle counter is 16 bits in length.
- 0b0101: The cycle counter is 17 bits in length.
- 0b0110: The cycle counter is 18 bits in length.
- 0b0111: The cycle counter is 19 bits in length.
- 0b1000: The cycle counter is 20 bits in length.
All other values are reserved.

**Otherwise:**
Reserved, RES0.

**DVSIZE, bits [24:20]**

*When TRCIDR0.TRCDATA != 0b00:*
Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.
- 0b00000: Data value tracing not implemented.
- 0b00100: Data value tracing has a maximum of 32-bit data values.
- 0b01000: Data value tracing has a maximum of 64-bit data values.
All other values are reserved.

**Otherwise:**
Reserved, RES0.

**DASIZE, bits [19:15]**

*When TRCIDR0.TRCDATA != 0b00:*
Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.
- 0b00000: Data address tracing not implemented.
- 0b00100: Data address tracing has a maximum of 32-bit data addresses.
- 0b01000: Data address tracing has a maximum of 64-bit data addresses.
All other values are reserved.

**Otherwise:**
Reserved, RES0.

**VMIDSIZE, bits [14:10]**
Indicates the trace unit Virtual context identifier size.
- 0b00000: Virtual context identifier tracing is not supported.
- 0b00001: 8-bit Virtual context identifier size.
- 0b00010: 16-bit Virtual context identifier size.
- 0b00100: 32-bit Virtual context identifier size.
All other values are reserved.
If the PE does not implement EL2 then this field is 0b00000.
If the PE implements EL2 then this field is 0b00100.

**CIDSIZE, bits [9:5]**
Indicates the Context identifier size.
- 0b00000: Context identifier tracing is not supported.
- 0b00100: 32-bit Context identifier size.
All other values are reserved.
This field reads as 0b00100.

**IASIZE, bits [4:0]**
Virtual instruction address size.
- 0b00100: Maximum of 32-bit instruction address size.
- 0b01000: Maximum of 64-bit instruction address size.
All other values are reserved.
This field reads as 0b01000.

**Accessing the TRCIDR2:**

TRCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1E8</td>
<td>TRCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.36 TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

**Purpose**

Returns the base architecture of the trace unit.

**Configurations**

External register TRCIDR3 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR3[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR3 are RES0.

**Attributes**

TRCIDR3 is a 32-bit register.

**Field descriptions**

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

- 0b0: Overflow prevention is not implemented.
- 0b1: Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

- 0b00000: The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

- 0b0: Stalling of the PE is not permitted.
- 0b1: Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.
STALLCTL, bit [26]
Indicates if trace unit implements stalling of the PE.
0b0  Stalling of the PE is not implemented.
0b1  Stalling of the PE is implemented.

SYNCR, bit [25]
Indicates if an implementation has a fixed synchronization period.
0b0  TRCSYNCR is read/write so software can change the synchronization period.
0b1  TRCSYNCR is read-only so the synchronization period is fixed.
This field reads as 0.

TRCERR, bit [24]
Indicates forced tracing of System Error exceptions is implemented.
0b0  Forced tracing of System Error exceptions is not implemented.
0b1  Forced tracing of System Error exceptions is implemented.
This field reads as 1.

Bit [23]
Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]
Indicates if Non-secure EL2 is implemented.
0b0  Non-secure EL2 is not implemented.
0b1  Non-secure EL2 is implemented.

EXLEVEL_NS_EL1, bit [21]
Indicates if Non-secure EL1 is implemented.
0b0  Non-secure EL1 is not implemented.
0b1  Non-secure EL1 is implemented.

EXLEVEL_NS_EL0, bit [20]
Indicates if Non-secure EL0 is implemented.
0b0  Non-secure EL0 is not implemented.
0b1  Non-secure EL0 is implemented.

EXLEVEL_S_EL3, bit [19]
Indicates if EL3 is implemented.
0b0  EL3 is not implemented.
0b1  EL3 is implemented.

EXLEVEL_S_EL2, bit [18]
Indicates if Secure EL2 is implemented.
0b0  Secure EL2 is not implemented.
0b1  Secure EL2 is implemented.

EXLEVEL_S_EL1, bit [17]
Indicates if Secure EL1 is implemented.
0b0  Secure EL1 is not implemented.
0b1  Secure EL1 is implemented.
**EXLEVEL_S_EL0, bit 16**

Indicates if Secure EL0 is implemented.
- `0b0` Secure EL0 is not implemented.
- `0b1` Secure EL0 is implemented.

**Bits [15:14]**

Reserved, RES0.

**CCITMIN, bits [11:0]**

Indicates the minimum value that can be programmed in TRCCCTRLR.THRESHOLD.
- If TRCIDR0.TRCCCI == 1 then the minimum value of this field is 0x001.
- If TRCIDR0.TRCCCI == 0 then this field is zero.

**Accessing the TRCIDR3:**

TRCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1EC</td>
<td>TRCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.37 TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR4 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR4[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR4 are RES0.

**Attributes**

TRCIDR4 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>NUMVMIDC</th>
<th>NUMCIDC</th>
<th>NUMSSCC</th>
<th>NUMPC</th>
<th>RES0</th>
<th>NUMDVC</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 28 23 20 16 15 12 11 9 8 7 6 3 0</td>

</tr>
<tr>
<td>NUMRPAIR</td>
<td>SUPPDA</td>
<td>NUMACPAIRS</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NUMVMIDC, bits [31:28]**

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

- 00000: No Virtual Context Identifier Comparators are available.
- 00001: The implementation has one Virtual Context Identifier Comparator.
- 00010: The implementation has two Virtual Context Identifier Comparators.
- 00011: The implementation has three Virtual Context Identifier Comparators.
- 00100: The implementation has four Virtual Context Identifier Comparators.
- 00101: The implementation has five Virtual Context Identifier Comparators.
- 00110: The implementation has six Virtual Context Identifier Comparators.
- 00111: The implementation has seven Virtual Context Identifier Comparators.
- 01000: The implementation has eight Virtual Context Identifier Comparators.

All other values are reserved.

**NUMCIDC, bits [27:24]**

Indicates the number of Context Identifier Comparators that are available for tracing.

- 00000: No Context Identifier Comparators are available.
- 00001: The implementation has one Context Identifier Comparator.
- 00010: The implementation has two Context Identifier Comparators.
- 00011: The implementation has three Context Identifier Comparators.
- 00100: The implementation has four Context Identifier Comparators.
- 00101: The implementation has five Context Identifier Comparators.
- 00110: The implementation has six Context Identifier Comparators.
- 00111: The implementation has seven Context Identifier Comparators.
- 01000: The implementation has eight Context Identifier Comparators.

All other values are reserved.
NUMSSCC, bits [23:20]
Indicates the number of Single-shot Comparator Controls that are available for tracing.
0b0000 No Single-shot Comparator Controls are available.
0b0001 The implementation has one Single-shot Comparator Control.
0b0010 The implementation has two Single-shot Comparator Controls.
0b0011 The implementation has three Single-shot Comparator Controls.
0b0100 The implementation has four Single-shot Comparator Controls.
0b0101 The implementation has five Single-shot Comparator Controls.
0b0110 The implementation has six Single-shot Comparator Controls.
0b0111 The implementation has seven Single-shot Comparator Controls.
0b1000 The implementation has eight Single-shot Comparator Controls.
All other values are reserved.

NUMRSPAIR, bits [19:16]
Indicates the number of resource selector pairs that are available for tracing.
0b0000 The implementation has zero resource selectors.
0b0001 The implementation has two resource selector pairs.
0b0010 The implementation has three resource selector pairs.
0b0011 The implementation has four resource selector pairs.
0b0100 The implementation has five resource selector pairs.
0b0101 The implementation has six resource selector pairs.
0b0110 The implementation has seven resource selector pairs.
0b0111 The implementation has eight resource selector pairs.
0b1000 The implementation has nine resource selector pairs.
0b1001 The implementation has ten resource selector pairs.
0b1010 The implementation has eleven resource selector pairs.
0b1011 The implementation has twelve resource selector pairs.
0b1100 The implementation has thirteen resource selector pairs.
0b1101 The implementation has fourteen resource selector pairs.
0b1110 The implementation has fifteen resource selector pairs.
0b1111 The implementation has sixteen resource selector pairs.
All other values are reserved.

NUMPC, bits [15:12]
Indicates the number of PE Comparator Inputs that are available for tracing.
0b0000 No PE Comparator Inputs are available.
0b0001 The implementation has one PE Comparator Input.
0b0010 The implementation has two PE Comparator Inputs.
0b0011 The implementation has three PE Comparator Inputs.
0b0100 The implementation has four PE Comparator Inputs.
0b0101 The implementation has five PE Comparator Inputs.
0b0110 The implementation has six PE Comparator Inputs.
0b0111 The implementation has seven PE Comparator Inputs.
0b1000 The implementation has eight PE Comparator Inputs.
All other values are reserved.
Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS \neq 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not
implemented in ETE and are reserved for other trace architectures. Allocated in other trace
architectures.

0b0 Data address comparisons not implemented.
0b1 Data address comparisons implemented.

This field reads as 0.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in
ETE and are reserved for other trace architectures. Allocated in other trace architectures.

0b0000 No data value comparators implemented.
0b0001 One data value comparator implemented.
0b0010 Two data value comparators implemented.
0b0011 Three data value comparators implemented.
0b0100 Four data value comparators implemented.
0b0101 Five data value comparators implemented.
0b0110 Six data value comparators implemented.
0b0111 Seven data value comparators implemented.
0b1000 Eight data value comparators implemented.

All other values are reserved.

This field reads as 0b0000.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

0b0000 No Address Comparator pairs are available.
0b0001 The implementation has one Address Comparator pair.
0b0010 The implementation has two Address Comparator pairs.
0b0011 The implementation has three Address Comparator pairs.
0b0100 The implementation has four Address Comparator pairs.
0b0101 The implementation has five Address Comparator pairs.
0b0110 The implementation has six Address Comparator pairs.
0b0111 The implementation has seven Address Comparator pairs.
0b1000 The implementation has eight Address Comparator pairs.

All other values are reserved.
Accessing the TRCIDR4:

TRCIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1F0</td>
<td>TRCIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
### H9.3.38 TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR5 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR5[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR5 are RES0.

**Attributes**

TRCIDR5 is a 32-bit register.

**Field descriptions**

![Field descriptions diagram]

- **Bit [31]**
  - Reserved, RES0.

- **NUMCNTR, bits [30:28]**
  - Indicates the number of Counters that are available for tracing.
  - 0b000 No Counters are available.
  - 0b001 One Counter implemented.
  - 0b010 Two Counters implemented.
  - 0b011 Three Counters implemented.
  - 0b100 Four Counters implemented.
  - All other values are reserved.
  - If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

- **NUMSEQSTATE, bits [27:25]**
  - Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.
  - 0b000 The Sequencer is not implemented.
  - 0b100 Four Sequencer states are implemented.
  - All other values are reserved.
  - If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

- **Bit [24]**
  - Reserved, RES0.

- **LPOVERRIDE, bit [23]**
  - Indicates support for Low-power Override Mode.
  - 0b0 The trace unit does not support Low-power Override Mode.
  - 0b1 The trace unit supports Low-power Override Mode.
ATBTRIG, bit [22]
Indicates if the implementation can support ATB triggers.
0b0    The implementation does not support ATB triggers.
0b1    The implementation supports ATB triggers.
If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]
Indicates the trace ID width.
0b000000    The external trace interface is not implemented.
0b000111    The implementation supports a 7-bit trace ID.
All other values are reserved.
Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]
Reserved, RES0.

NUMEXTINSEL, bits [11:9]
Indicates how many External Input Selector resources are implemented.
0b000    No External Input Selector resources are available.
0b001    1 External Input Selector resource is available.
0b010    2 External Input Selector resources are available.
0b011    3 External Input Selector resources are available.
0b100    4 External Input Selector resources are available.
All other values are reserved.

NUMEXTIN, bits [8:0]
Indicates how many External Inputs are implemented.
0b111111111    Unified PMU event selection.
All other values are reserved.

Accessing the TRCIDR5:
TRCIDR5 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xF4</td>
<td>TRCIDR5</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.39 TRCIDR6, ID Register 6

The TRCIDR6 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR6 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR6[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR6 are RES0.

**Attributes**

TRCIDR6 is a 32-bit register.

**Field descriptions**

![Field diagram]

*Bits [31:3]*

Reserved, RES0.

*EXLEVEL_RL_EL2, bit [2]*

Indicates if Realm EL2 is implemented.

- **0b0**: Realm EL2 is not implemented.
- **0b1**: Realm EL2 is implemented.

*EXLEVEL_RL_EL1, bit [1]*

Indicates if Realm EL1 is implemented.

- **0b0**: Realm EL1 is not implemented.
- **0b1**: Realm EL1 is implemented.

*EXLEVEL_RL_EL0, bit [0]*

Indicates if Realm EL0 is implemented.

- **0b0**: Realm EL0 is not implemented.
- **0b1**: Realm EL0 is implemented.

**Accessing the TRCIDR6:**

TRCIDR6 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xF8</td>
<td>TRCIDR6</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.40 TRCIDR7, ID Register 7

The TRCIDR7 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configurations

External register TRCIDR7 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR7[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR7 are RES0.

Attributes

TRCIDR7 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Accessing the TRCIDR7:

TRCIDR7 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1FC</td>
<td>TRCIDR7</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.41 TRCIDR8, ID Register 8

The TRCIDR8 characteristics are:

**Purpose**

Returns the maximum speculation depth of the instruction trace element stream.

**Configurations**

External register TRCIDR8 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR8[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR8 are RES0.

**Attributes**

TRCIDR8 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXSPEC</td>
<td></td>
</tr>
</tbody>
</table>

**MAXSPEC, bits [31:0]**

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

**Accessing the TRCIDR8:**

TRCIDR8 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x180</td>
<td>TRCIDR8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.42 TRCIDR9, ID Register 9

The TRCIDR9 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configurations**

External register TRCIDR9 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR9[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR9 are RES0.

**Attributes**

TRCIDR9 is a 32-bit register.

**Field descriptions**

NUMP0KEY, bits [31:0]

*When TRCIDR0.TRCDATA != 0b00:*

Indicates the number of P0 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

*Otherwise:*

Reserved, RES0.

**Accessing the TRCIDR9:**

TRCIDR9 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x184</td>
<td>TRCIDR9</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.43 TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

**Purpose**

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

**Configurations**

External register TRCIMSPEC0 bits [31:0] are architecturally mapped to AArch64 System register TRCIMSPEC0[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC0 are RES0.

**Attributes**

TRCIMSPEC0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>EN</td>
<td>Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.</td>
</tr>
<tr>
<td>SUPPORT</td>
<td>The reset behavior of this field is:</td>
</tr>
<tr>
<td></td>
<td>• On a Trace unit reset, this field resets to 0.</td>
</tr>
</tbody>
</table>

When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

- 0b0000 The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
- 0b0001 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b0010 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b0011 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b0100 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b0101 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b0110 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b0111 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1000 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1001 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1010 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1011 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1100 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1101 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1110 The trace unit behavior is IMPLEMENTATION DEFINED.
- 0b1111 The trace unit behavior is IMPLEMENTATION DEFINED.
Otherwise:

Reserved, RES0.

**SUPPORT, bits [3:0]**

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

- **0b0000** No IMPLEMENTATION DEFINED features are supported.
- **0b0001** IMPLEMENTATION DEFINED features are supported.
- **0b0010** IMPLEMENTATION DEFINED features are supported.
- **0b0011** IMPLEMENTATION DEFINED features are supported.
- **0b0100** IMPLEMENTATION DEFINED features are supported.
- **0b0101** IMPLEMENTATION DEFINED features are supported.
- **0b0110** IMPLEMENTATION DEFINED features are supported.
- **0b0111** IMPLEMENTATION DEFINED features are supported.
- **0b1000** IMPLEMENTATION DEFINED features are supported.
- **0b1001** IMPLEMENTATION DEFINED features are supported.
- **0b1010** IMPLEMENTATION DEFINED features are supported.
- **0b1011** IMPLEMENTATION DEFINED features are supported.
- **0b1100** IMPLEMENTATION DEFINED features are supported.
- **0b1101** IMPLEMENTATION DEFINED features are supported.
- **0b1110** IMPLEMENTATION DEFINED features are supported.
- **0b1111** IMPLEMENTATION DEFINED features are supported.

Use of nonzero values requires written permission from Arm.

Access to this field is RO.

**Accessing the TRCIMSPEC0:**

TRCIMSPEC0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1C0</td>
<td>TRCIMSPEC0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.44 TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

**Purpose**
These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

**Configurations**
External register TRCIMSPEC<n> bits [31:0] are architecturally mapped to AArch64 System register TRCIMSPEC<n>[31:0].
This register is present only when the trace unit implements this OPTIONAL register and FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are RES0.

**Attributes**
TRCIMSPEC<n> is a 32-bit register.

**Field descriptions**

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.
This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

**Accessing the TRCIMSPEC<n>:**
TRCIMSPEC<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1C0 + (4 * n)</td>
<td>TRCIMSPEC&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.45 TRCITCTRL, Integration Mode Control Register

The TRCITCTRL characteristics are:

**Purpose**

A component can use TRCITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCITCTRL are RES0.

**Attributes**

TRCITCTRL is a 32-bit register.

**Field descriptions**

![Field diagram](image)

Bits [31:1]

Reserved, RES0.

IME, bit [0]

When topology detection or integration functionality is implemented:

Integration Mode Enable.

- 0b0 Component functional mode.
- 0b1 Component integration mode. Support for topology detection and integration testing is enabled.

Otherwise:

Reserved, RES0.

**Accessing the TRCITCTRL:**

External debugger accesses to this register are IMPLEMENTATION DEFINED when the trace unit is not in the Idle state.

TRCITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xF00</td>
<td>TRCITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.46 TRCLAR, Lock Access Register

The TRCLAR characteristics are:

Purpose

Used to lock and unlock the Software Lock.
Note that ETE does not implement the Software Lock.
For additional information, see the CoreSight Architecture Specification.

Configurations

This register is present only when FEAT_ETE is implemented and the Software Lock is implemented. Otherwise, direct accesses to TRCLAR are RES0.

Attributes

TRCLAR is a 32-bit register.

Field descriptions

KEY, bits [31:0]

When Software Lock is implemented:
Software Lock Key.
A value of 0xC5ACCE55 unlocks the Software Lock.
Any other value locks the Software Lock.

Otherwise:
Reserved, RES0.

Accessing the TRCLAR:

External debugger accesses to this register are unaffected by the OS Lock.

TRCLAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFB0</td>
<td>TRCLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are WO.
H9.3.47 TRCLSR, Lock Status Register

The TRCLSR characteristics are:

**Purpose**

Indicates whether the Software Lock is implemented, and the current status of the Software Lock.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCLSR are RES0.

**Attributes**

TRCLSR is a 32-bit register.

**Field descriptions**

![Field descriptions diagram]

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Software lock size.

Reads as 0b0.

Access to this field is RO.

**SLK, bit [1]**

The current Software Lock status.

0b0  Software Lock is unlocked.

0b1  Software Lock is locked. Writes to the other registers in this component, except for the TRCLAR, are ignored.

This field reads as 0.

**SLI, bit [0]**

Indicates whether the Software Lock is implemented.

0b0  Software Lock is not implemented. Writes to the TRCLAR are ignored.

0b1  Software Lock is implemented.

This field reads as 0.

**Accessing the TRCLSR:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCLSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFB4</td>
<td>TRCLSR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.48 TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

**Purpose**

Returns the status of the Trace OS Lock.

**Configurations**

External register TRCOSLSR bits [31:0] are architecturally mapped to AArch64 System register TRCOSLSR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCOSLSR are RES0.

**Attributes**

TRCOSLSR is a 32-bit register.

**Field descriptions**

```
  31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
   RES0
```

**Bits [31:5]**

Reserved, RES0.

**OSLM, bits [4:3, 0]**

OS Lock model.

- **0b00**  Trace OS Lock is not implemented.
- **0b01**  Trace OS Lock is implemented.
- **0b10**  Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

**Bit [2]**

Reserved, RES0.

**OSLK, bit [1]**

OS Lock status.

- **0b**  The OS Lock is unlocked.
- **0b1**  The OS Lock is locked.

Note that this field indicates the state of the PE OS Lock.

**Accessing the TRCOSLSR:**

External debugger accesses to this register are unaffected by the OS Lock.
TRCOSLSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x304</td>
<td>TRCOSLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.49 TRCPDCR, PowerDown Control Register

The TRCPDCR characteristics are:

**Purpose**
Requests the system to provide power to the trace unit.

**Configurations**
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPDCR are RES0.

**Attributes**
TRCPDCR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:4]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0b0</td>
<td>The system can remove power from the trace unit core power domain, or requests for power to the trace unit core power domain are implemented outside of the trace unit.</td>
</tr>
<tr>
<td>0b1</td>
<td>The system must provide power to the trace unit core power domain.</td>
</tr>
<tr>
<td>Bits [2:0]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Accessing the TRCPDCR:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x310</td>
<td>TRCPDCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
**H9.3.50  TRCPDSR, PowerDown Status Register**

The TRCPDSR characteristics are:

**Purpose**

Indicates the power status of the trace unit.

**Configurations**

This register is present only when FEAT_ESE is implemented. Otherwise, direct accesses to TRCPDSR are RES0.

**Attributes**

TRCPDSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:6</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td></td>
<td>0b0 The OS Lock is unlocked.</td>

<tr>
<td></td>
<td>The reset behavior of this field is:</td>
</tr>
<tr>
<td></td>
<td>• On a Trace unit reset, this field resets to 1.</td>
</tr>
<tr>
<td>0</td>
<td>POWER, bit [0] Power Status.</td>
</tr>
<tr>
<td></td>
<td>0b0 The trace unit core power domain is not powered. All trace unit registers are not accessible and they all return an error response.</td>
</tr>
<tr>
<td></td>
<td>0b1 The trace unit core power domain is powered. Trace unit registers are accessible.</td>
</tr>
<tr>
<td></td>
<td>Access to this field is RAO/WI.</td>
</tr>
</tbody>
</table>
Accessing the TRCPDSR:

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x314</td>
<td>TRCPDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.51 TRCPIDR0, Peripheral Identification Register 0

The TRCPIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR0 are RES0.

**Attributes**

TRCPIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, bits [7:0].

The part number is selected by the designer of the component, and is stored in TRCPIDR1.PART_1 and TRCPIDR0.PART_0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the TRCPIDR0:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFE0</td>
<td>TRCPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
### H9.3.52 TRCPIDR1, Peripheral Identification Register 1

The TRCPIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR1 are RES0.

**Attributes**

TRCPIDR1 is a 32-bit register.

**Field descriptions**

<table>

</tr>
</tbody>
</table>
| 7:4  | DES_0  | Designer, JEP106 identification code, bits [3:0]. TRCPIDR1.DES_0 and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.  
**Note**  
For a component designed by Arm Limited, the JEP106 identification code is 0x3B.  
**Note**  
This field has an IMPLEMENTATION DEFINED value.  
Access to this field is RO. |
| 3:0  | PART_1 | Part number, bits [11:8]. The part number is selected by the designer of the component, and is stored in TRCPIDR1.PART_1 and TRCPIDR0.PART_0.  
**Note**  
This field has an IMPLEMENTATION DEFINED value.  
Access to this field is RO. |

**Accessing the TRCPIDR1:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFE4</td>
<td>TRCPIDR1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.53   TRCPIDR2, Peripheral Identification Register 2

The TRCPIDR2 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configurations

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR2 are RES0.

Attributes

TRCPIDR2 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>

</tbody>
</table>

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. TRCPIDR2.REVISION and TRCPIDR3.REVAND together form the revision number of the component, with TRCPIDR2.REVISION being the most significant part and TRCPIDR3.REVAND the least significant part. When a component is changed, TRCPIDR2.REVISION or TRCPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. TRCPIDR3.REVAND should be set to 0b0000 when TRCPIDR2.REVISION is increased.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.
Reads as 0b1.
Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. TRCPIDR1.DES_0 and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.
Accessing the TRCPIDR2:

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFE8</td>
<td>TRCPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.54   TRCPIDR3, Peripheral Identification Register 3

The TRCPIDR3 characteristics are:

**Purpose**
Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

**Configurations**
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR3 are RES0.

**Attributes**
TRCPIDR3 is a 32-bit register.

**Field descriptions**

```
+----------------+----------------+----------------+----------------+
|     31         |       8        |       3        |       0        |
| RES0           | REV AND       | CMOD           |
+----------------+----------------+----------------+
```

**Bits [31:8]**
Reserved, RES0.

**REVAND, bits [7:4]**
Component minor revision. TRCPIDR2.REVISION and TRCPIDR3.REV AND together form the revision number of the component, with TRCPIDR2.REVISION being the most significant part and TRCPIDR3.REV AND the least significant part. When a component is changed, TRCPIDR2.REVISION or TRCPIDR3.REV AND are increased to ensure that software can differentiate the different revisions of the component. TRCPIDR3.REV AND should be set to 0b0000 when TRCPIDR2.REVISION is increased.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**CMOD, bits [3:0]**
Customer Modified.
Indicates the component has been modified.
A value of 0b0000 means the component is not modified from the original design.
Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.
For any two components with the same Unique Component Identifier:
- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Accessing the TRCPIDR3:**
External debugger accesses to this register are unaffected by the OS Lock.
TRCPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFEC</td>
<td>TRCPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.55 TRCPIDR4, Peripheral Identification Register 4

The TRCPIDR4 characteristics are:

**Purpose**

Provides discovery information about the component. For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR4 are RES0.

**Attributes**

TRCPIDR4 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIZE, bits [7:4]</td>
<td></td>
</tr>
<tr>
<td>Size of the component. The distance from the start of the address space used by this component to the end of the component identification registers. A value of 0b0000 means one of the following is true:</td>
<td></td>
</tr>
<tr>
<td>• The component uses a single 4KB block. • The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.</td>
<td></td>
</tr>
<tr>
<td>Any other value means the component occupies 2^{TRCPIDR4.SIZE} 4KB blocks. Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component. Reads as 0b0000. Access to this field is RO.</td>
<td></td>
</tr>
<tr>
<td>DES_2, bits [3:0]</td>
<td></td>
</tr>
<tr>
<td>Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <a href="http://www.jedec.org">http://www.jedec.org</a>.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.
Accessing the TRCPIDR4:

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>

<td>TRCPIDR5</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
H9.3.57   TRCPIDR6, Peripheral Identification Register 6

The TRCPIDR6 characteristics are:

**Purpose**

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR6 are RES0.

**Attributes**

TRCPIDR6 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Accessing the TRCPIDR6:**

External debugger accesses to this register are unaffected by the OS Lock.
TRCPIDR6 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFD8</td>
<td>TRCPIDR6</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

* When !IsTraceCorePowered() accesses to this register generate an error response.
* Otherwise accesses to this register are RO.
H9.3.58 TRCPIDR7, Peripheral Identification Register 7

The TRCPIDR7 characteristics are:

**Purpose**

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

**Configurations**

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR7 are RES0.

**Attributes**

TRCPIDR7 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

<tbody>
<tr>
<td>[31:0]</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCPIDR7:**

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR7 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFD</td>
<td>TRCPIDR7</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.

- Otherwise accesses to this register are RO.
H9.3.59 TRCPRGCTLR, Programming Control Register

The TRCPRGCTLR characteristics are:

**Purpose**

Enables the trace unit.

**Configurations**

External register TRCPRGCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCPRGCTLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPRGCTLR are RES0.

**Attributes**

TRCPRGCTLR is a 32-bit register.

**Field descriptions**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td>EN</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**EN, bit [0]**

Trace unit enable.

0b0 The trace unit is disabled.

0b1 The trace unit is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

**Accessing the TRCPRGCTLR:**

Must be programmed.

TRCPRGCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x004</td>
<td>TRCPRGCTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

- Otherwise accesses to this register are RW.
H9.3.60 TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

**Purpose**

Controls when Q elements are enabled.

**Configurations**

External register TRCQCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCQCTLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTLR are RES0.

**Attributes**

TRCQCTLR is a 32-bit register.

**Field descriptions**

![Field Descriptions Diagram]

**Bits [31:9]**

Reserved, RES0.

**MODE, bit [8]**

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

- **0b0** Exclude mode.
  
  The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.

- **0b1** Include Mode.
  
  The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE[<m>], bit [m], for m = 7 to 0**

Specifies whether Address Range Comparator <m> controls Q elements.

- **0b0** The address range that Address Range Comparator <m> defines, is not selected.
- **0b1** The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**Accessing the TRCQCTRL:**

Must be programmed if `TRCCONFIGR.QE != 0b00`.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

TRCQCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x044</td>
<td>TRCQCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `OSLockStatus()`, or `!AllowExternalTraceAccess()` or `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.61 TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

**Purpose**

Controls the selection of the resources in the trace unit.

**Configurations**

External register TRCRSCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCRSCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented and (UInt(TRCIDR4.NUMRSPAIR) + 1) * 2 > n. Otherwise, direct accesses to TRCRSCTLR<n> are RES0.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

**Attributes**

TRCRSCTLR<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>22</th>
<th>21</th>
<th>19</th>
<th>18</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>GROUP</td>
<td>SELECT</td>
<td>PAIRINV</td>
<td>INV</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:22]**

Reserved, RES0.

**PAIRINV, bit [21]**

_When n MOD 2 == 0:_

Controls whether the combined result from a resource selector pair is inverted.

- **0b0** Do not invert the combined output of the 2 resource selectors.
- **0b1** Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- **0b000** -> A and B.
- **0b001** -> Reserved.
- **0b010** -> not(A) and B.
- **0b011** -> not(A) and not(B).
- **0b100** -> not(A) or not(B).
- **0b101** -> not(A) or B.
- **0b110** -> Reserved.
- **0b111** -> A or B.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**INV, bit [20]**

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

- **0b0**  Do not invert the output of this selector.
- **0b1**  Invert the output of this selector.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**GROUP, bits [19:16]**

Selects a group of resources.

- **0b0000**  External Input Selectors.
- **0b0001**  PE Comparator Inputs.
- **0b0010**  Counters and Sequencer.
- **0b0011**  Single-shot Comparator Controls.
- **0b0100**  Single Address Comparators.
- **0b0101**  Address Range Comparators.
- **0b0110**  Context Identifier Comparators.
- **0b0111**  Virtual Context Identifier Comparators.

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**SELECT, bits [15:0]**

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

**SELECT encoding for External Input Selectors**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>Reserved, RES0</td>

<tr>
<td>4-0</td>
<td>EXTIN[3:0]</td>
</tr>
</tbody>
</table>

**Bits [15:4]**

Reserved, RES0.

**EXTIN[<m>], bit [m], for m = 3 to 0**

Selects one or more External Inputs.

- **0b0**  Ignore EXTIN <m>.
- **0b1**  Select EXTIN <m>.

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.
**SELECT encoding for PE Comparator Inputs**

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0
Selects one or more PE Comparator Inputs.

- **0b0**: Ignore PE Comparator Input <m>.
- **0b1**: Select PE Comparator Input <m>.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Counters and Sequencer**

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0
Sequencer states.

- **0b0**: Ignore Sequencer state <m>.
- **0b1**: Select Sequencer state <m>.

This bit is RES0 if m >= TRCIDR5.NUMSEQSTATE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0
Counters resources at zero.

- **0b0**: Ignore Counter <m>.
- **0b1**: Select Counter <m> is zero.

This bit is RES0 if m >= TRCIDR5.NUMCNTR.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**SELECT encoding for Single-shot Comparator Controls**

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[m], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

0b0 Ignore Single-shot Comparator Control <m>.
0b1 Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= TRCIDR4.NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Single Address Comparators**

SAC[m], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

0b0 Ignore Single Address Comparator <m>.
0b1 Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**SELECT encoding for Address Range Comparators**

Bits [15:8]
Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0
Selects one or more Address Range Comparators.
- 0b0: Ignore Address Range Comparator <m>.
- 0b1: Select Address Range Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Context Identifier Comparators**

Bits [15:8]
Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0
Selects one or more Context Identifier Comparators.
- 0b0: Ignore Context Identifier Comparator <m>.
- 0b1: Select Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMCIDC.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Virtual Context Identifier Comparators**

No diagram provided for this section.
Bits [15:8]

Reserved, RES0.

VMID[m], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

0b0  Ignore Virtual Context Identifier Comparator <m>.

0b1  Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMVMIDC.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCRSCtlR<n>:

Must be programmed if any of the following are true:

• TRCCNCTL<n>.RLDEVENT.TYPE == 0 and TRCCNCTL<n>.RLDEVENT.SEL == n.
• TRCCNCTL<n>.RLDEVENT.TYPE == 1 and TRCCNCTL<n>.RLDEVENT.SEL == n/2.
• TRCCNCTL<n>.CNTEVENT.TYPE == 0 and TRCCNCTL<n>.CNTEVENT.SEL == n.
• TRCCNCTL<n>.CNTEVENT.TYPE == 1 and TRCCNCTL<n>.CNTEVENT.SEL == n/2.
• TRCEVENTCTL0R.EVENT0.TYPE == 0 and TRCEVENTCTL0R.EVENT0.SEL == n.
• TRCEVENTCTL0R.EVENT0.TYPE == 1 and TRCEVENTCTL0R.EVENT0.SEL == n/2.
• TRCEVENTCTL0R.EVENT1.TYPE == 0 and TRCEVENTCTL0R.EVENT1.SEL == n.
• TRCEVENTCTL0R.EVENT1.TYPE == 1 and TRCEVENTCTL0R.EVENT1.SEL == n/2.
• TRCEVENTCTL0R.EVENT2.TYPE == 0 and TRCEVENTCTL0R.EVENT2.SEL == n.
• TRCEVENTCTL0R.EVENT2.TYPE == 1 and TRCEVENTCTL0R.EVENT2.SEL == n/2.
• TRCEVENTCTL0R.EVENT3.TYPE == 0 and TRCEVENTCTL0R.EVENT3.SEL == n.
• TRCEVENTCTL0R.EVENT3.TYPE == 1 and TRCEVENTCTL0R.EVENT3.SEL == n/2.
• TRCSEQEVR<n>.B.TYPE == 0 and TRCSEQEVR<n>.B.SEL = n.
• TRCSEQEVR<n>.B.TYPE == 1 and TRCSEQEVR<n>.B.SEL = n/2.
• TRCSEQEVR<n>.F.TYPE == 0 and TRCSEQEVR<n>.F.SEL = n.
• TRCSEQEVR<n>.F.TYPE == 1 and TRCSEQEVR<n>.F.SEL = n/2.
• TRCSQRTSR<n>.RST.TYPE == 0 and TRCSQRTSR<n>.RST.SEL == n.
• TRCSQRTSR<n>.RST.TYPE == 1 and TRCSQRTSR<n>.RST.SEL == n/2.
• TRCTSTCTRL.EVENT.TYPE == 0 and TRCTSTCTRL.EVENT.SEL == n.
• TRCTSTCTRL.EVENT.TYPE == 1 and TRCTSTCTRL.EVENT.SEL == n/2.
• TRCVICTLR.EVENT.TYPE == 0 and TRCVICTLR.EVENT.SEL == n.
• TRCVICTLR.EVENT.TYPE == 1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
TRCRSCTLR<\text{n}> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x200 + (4 * n)</td>
<td>TRCRSCTLR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.62 TRCRSR, Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configurations

External register TRCRSR bits [31:0] are architecturally mapped to AArch64 System register TRCRSR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCRSR are RES0.

Attributes

TRCRSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

0b0 Tracing is not active.

0b1 Tracing is active.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

0b0 An ETEEvent <m> has not occurred.

0b1 An ETEEvent <m> has occurred while the resources were in the Paused state.

This bit is RES0 if TRCIDR4.NUMRSPAIR == 0 || m > TRCIDR0.NUMEVENT.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

0b0 An event selected by External Input Selector <m> has not occurred.

0b1 At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCRSR:**

Must always be programmed.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCRSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x028</td>
<td>TRCRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.63 TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

**Purpose**

Moves the Sequencer state:
- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

**Configurations**

External register TRCSEQEVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSEQEVR<n>[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are RES0.

**Attributes**

TRCSEQEVR<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15</td>
<td>B_TYPE, bit [15]</td>
</tr>
<tr>
<td>14-13</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>12-8</td>
<td>B_SEL, bits [12:8]</td>
</tr>
<tr>
<td>7-0</td>
<td>F_SEL, bits [7:0]</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**B_TYPE, bit [15]**

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

- 0b0 A single Resource Selector.
  TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

- 0b1 A Boolean-combined pair of Resource Selectors.
  TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [14:13]**

Reserved, RES0.

**B_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.
If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**F_TYPE, bit [7]**

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F_SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

- 0b0 A single Resource Selector.
  - TRCSEQEVR<n>.F_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

- 0b1 A Boolean-combined pair of Resource Selectors.
  - TRCSEQEVR<n>.F_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event.
  - TRCSEQEVR<n>.F_SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**F_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F_TYPE controls whether TRCSEQEVR<n>.F_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSEQEVR<n>**:  

Must be programmed if TRCRSCTRL<n>.GROUP == 0b0010 and TRCRSCTRL<n>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQEVR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x100 + (4 * n)</td>
<td>TRCSEQEVR&lt;n&gt;</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.64 TRCSEQRSTEV, Sequencer Reset Control Register

The TRCSEQRSTEV characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configurations

External register TRCSEQRSTEV bits [31:0] are architecturally mapped to AArch64 System register TRCSEQRSTEV[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEV are RES0.

Attributes

TRCSEQRSTEV is a 32-bit register.

Field descriptions

Bits [31:8]
Reserved, RES0.

RST_TYPE, bit [7]
Chooses the type of Resource Selector.

0b0 A single Resource Selector.

TRCSEQRSTEV.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors.

TRCSEQRSTEV.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEV.RST.SEL[4] is RES0.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]
Reserved, RES0.

RST_SEL, bits [4:0]
Defines the selected Resource Selector or pair of Resource Selectors.

TRCSEQRSTEV.RST.TYPE controls whether TRCSEQRSTEV.RST_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**Accessing the TRCSEQRSTEVR:**

Must be programmed if \( \text{TRCRSCTRL}<n>.\text{GROUP} = 0b0010 \) and \( \text{TRCRSCTRL}<n>.\text{SEQUENCER} \neq 0b0000 \).

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

TRCSEQRSTEVR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x118</td>
<td>TRCSEQRSTEVR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.65 TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

**Purpose**

Use this to set, or read, the Sequencer state.

**Configurations**

External register TRCSEQSTR bits [31:0] are architecturally mapped to AArch64 System register TRCSEQSTR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are res0.

**Attributes**

TRCSEQSTR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:2]</th>
<th>Reserved, res0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATE, bits [1:0]</td>
<td>Set or returns the state of the Sequencer.</td>
</tr>
<tr>
<td>0b00</td>
<td>State 0.</td>
</tr>
<tr>
<td>0b01</td>
<td>State 1.</td>
</tr>
<tr>
<td>0b10</td>
<td>State 2.</td>
</tr>
<tr>
<td>0b11</td>
<td>State 3.</td>
</tr>
</tbody>
</table>

The reset behavior of this field is:

* On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSEQSTR:**

Must be programmed if TRCRSCTRL<n>.GROUP == 0b0010 and TRCRSCTRL<n>.SEQUENCER != 0b0000.

Writes are CONstrained UNPREDICatable if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSEQSTR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x11C</td>
<td>TRCSEQSTR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

* When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
* Otherwise accesses to this register are RW.
H9.3.66 TRCSSCCR<n>, Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

**Purpose**

Controls the corresponding Single-shot Comparator Control resource.

**Configurations**

External register TRCSSCCR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSCCR<n>[31:0].

This register is present only when FEAT ETE is implemented and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCCR<n> are RES0.

**Attributes**

TRCSSCCR<n> is a 32-bit register.

**Field descriptions**

Bits [31:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

0b0 The Single-shot Comparator Control is in single-shot mode.

0b1 The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

0b0 The Address Range Comparator <m>, is not selected for Single-shot control.

0b1 The Address Range Comparator <m>, is selected for Single-shot control.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
SAC[m], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

- 0b0 The Single Address Comparator <m>, is not selected for Single-shot control.
- 0b1 The Single Address Comparator <m>, is selected for Single-shot control.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSSCCR<n>:**

Must be programmed if any TRCRSCTL<n>.GROUP == 0b011 and TRCRSCTL<n>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSSCCR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x280 + (4 * n)</td>
<td>TRCSSCCR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.67 TRCSSCSR<\(n\)>, Single-shot Comparator Control Status Register \(<n\), \(n = 0 \text{ - 7}\),

The TRCSSCSR<\(n\)> characteristics are:

**Purpose**

Returns the status of the corresponding Single-shot Comparator Control.

**Configurations**

External register TRCSSCSR<\(n\)> bits [31:0] are architecturally mapped to AArch64 System register TRCSSCSR<\(n\)>[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMSSCC) > \(n\). Otherwise, direct accesses to TRCSSCSR<\(n\)> are RES0.

**Attributes**

TRCSSCSR<\(n\)> is a 32-bit register.

**Field descriptions**

![Field Description Diagram]

**STATUS, bit [31]**

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR<\(n\)>-ARC, TRCSSCCR<\(n\)>-SAC, and TRCSSPCICR<\(n\)>-PC.

- \(0b0\) No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
- \(0b1\) One or more matches has occurred. If TRCSSCCR<\(n\)>-RST == 0 then:
  - There is only one match and no more matches are possible.
  - Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**PENDING, bit [30]**

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

- \(0b0\) No match has occurred.
- \(0b1\) One or more matches has occurred.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [29:4]**

Reserved, RES0.
PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

0b0  This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.

0b1  This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is RO.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

0b0  This Single-shot Comparator Control does not support data value comparisons.

0b1  This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is RO.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

0b0  This Single-shot Comparator Control does not support data address comparisons.

0b1  This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is RO.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

0b0  This Single-shot Comparator Control does not support instruction address comparisons.

0b1  This Single-shot Comparator Control supports instruction address comparisons.

This field reads as 1.

Access to this field is RO.

**Accessing the TRCSSCSR<n>:**

Must be programmed if TRCRSCTRL<n>, GROUP == 0b0011 and TRCRSCTRL<n>, SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSCSR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x2A0 + (4 * n)</td>
<td>TRCSSCSR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
H9.3.68 TRCSSPCICR\(\langle n\rangle\), Single-shot Processing Element Comparator Input Control Register \(\langle n\rangle\),
\(n = 0 - 7\)

The TRCSSPCICR\(\langle n\rangle\) characteristics are:

**Purpose**

Returns the status of the corresponding Single-shot Comparator Control.

**Configurations**

External register TRCSSPCICR\(\langle n\rangle\) bits [31:0] are architecturally mapped to AArch64 System register TRCSSPCICR\(\langle n\rangle\)[31:0].

This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMSSCC) > \(n\), UInt(TRCIDR4.NUMPC) > 0 and TRCSSCSR\(\langle n\rangle\).PC == 1. Otherwise, direct accesses to TRCSSPCICR\(\langle n\rangle\) are RES0.

**Attributes**

TRCSSPCICR\(\langle n\rangle\) is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8</td>
<td>PC[7]</td>
</tr>
<tr>
<td>7</td>
<td>PC[6]</td>
</tr>
<tr>
<td>6</td>
<td>PC[5]</td>
</tr>
<tr>

<td>PC[2]</td>
</tr>
<tr>
<td>2</td>
<td>PC[1]</td>
</tr>
<tr>
<td>1</td>
<td>PC[0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PC[<m>], bit [m], for m = 7 to 0**

Selects one or more PE Comparator Inputs for Single-shot control.

- \(0\)\(\emptyset\) The single PE Comparator Input \(<m>\), is not selected as for Single-shot control.
- \(0\)\(\emptyset\) The single PE Comparator Input \(<m>\), is selected as for Single-shot control.

This bit is RES0 if \(m >=\) TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSSPCICR\(\langle n\rangle\):**

Must be programmed if implemented and any TRCRSCTL\(\langle n\rangle\).GROUP == \(0\emptyset\emptyset\) and TRCRSCTL\(\langle n\rangle\).SINGLE_SSHOT\[n\] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSPCICR\(\langle n\rangle\) can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x2C0 + (4 (\times) (n))</td>
<td>TRCSSPCICR(\langle n\rangle)</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

• Otherwise accesses to this register are RW.
H9.3.69  TRCSTALLCTRLR, Stall Control Register

The TRCSTALLCTRLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configurations

External register TRCSTALLCTRLR bits [31:0] are architecturally mapped to AArch64 System register TRCSTALLCTRLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTRLR are RES0.

Attributes

TRCSTALLCTRLR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>LEVEL</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

*When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

0b0  Trace unit buffer overflow prevention is disabled.

0b1  Trace unit buffer overflow prevention is enabled.

Note that enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

•  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

STALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

0b0  The trace unit must not stall the PE.

0b1  The trace unit can stall the PE.

The reset behavior of this field is:

•  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.
LEVEL, bits [3:0]
Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.
The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.
The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.
Note that for some implementations, invasion might occur at the minimal invasion level.
One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a non-zero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSTALLCTLR:
Must be programmed if implemented.
Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
TRCSTALLCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x02C</td>
<td>TRCSTALLCTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
H9.3.70  TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configurations

External register TRCSTATR bits [31:0] are architecturally mapped to AArch64 System register TRCSTATR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSTATR are RES0.

Attributes

TRCSTATR is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

0b0 The programmers' model is not stable.

0b1 The programmers' model is stable.

Accessing this field has the following behavior:

• When the trace unit is enabled, access to this field is UNKNOWN/WI.

• Otherwise, access to this field is RO

IDLE, bit [0]

Idle status.

0b0 The trace unit is not idle.

0b1 The trace unit is idle.

Accessing the TRCSTATR:

TRCSTATR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x00C</td>
<td>TRCSTATR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

• Otherwise accesses to this register are RO.
H9.3.71 TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

**Purpose**
Controls how often trace protocol synchronization requests occur.

**Configurations**
External register TRCSYNCPR bits [31:0] are architecturally mapped to AArch64 System register TRCSYNCPR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are RES0.

**Attributes**
TRCSYNCPR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-5</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>4-0</td>
<td>PERIOD</td>
</tr>
</tbody>
</table>

- **Bits [31:5]**
  - Reserved, RES0.

- **PERIOD, bits [4:0]**
  - Defines the number of bytes of trace between each periodic trace protocol synchronization request.
  - 0b00000 Trace protocol synchronization is disabled.
  - 0b01000 Trace protocol synchronization request occurs after 2^8 bytes of trace.
  - 0b01001 Trace protocol synchronization request occurs after 2^9 bytes of trace.
  - 0b01010 Trace protocol synchronization request occurs after 2^10 bytes of trace.
  - 0b01011 Trace protocol synchronization request occurs after 2^11 bytes of trace.
  - 0b01100 Trace protocol synchronization request occurs after 2^12 bytes of trace.
  - 0b01101 Trace protocol synchronization request occurs after 2^13 bytes of trace.
  - 0b01110 Trace protocol synchronization request occurs after 2^14 bytes of trace.
  - 0b01111 Trace protocol synchronization request occurs after 2^15 bytes of trace.
  - 0b10000 Trace protocol synchronization request occurs after 2^16 bytes of trace.
  - 0b10001 Trace protocol synchronization request occurs after 2^17 bytes of trace.
  - 0b10010 Trace protocol synchronization request occurs after 2^18 bytes of trace.
  - 0b10011 Trace protocol synchronization request occurs after 2^19 bytes of trace.
  - 0b10100 Trace protocol synchronization request occurs after 2^20 bytes of trace.
  - Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:
    - No trace protocol synchronization requests are generated by this counter.
    - Trace protocol synchronization requests occur at the specified period.
    - Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.
  - The reset behavior of this field is:
    - On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Accessing the TRCSYNCPR:

Must be programmed if TRCIDR3.SYNCPR == 0.

Writes are CONSTRANDED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSYNCPR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x034</td>
<td>TRCSYNCPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.72 TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

**Purpose**
Sets the trace ID for instruction trace.

**Configurations**
External register TRCTRACEIDR bits [31:0] are architecturally mapped to AArch64 System register TRCTRACEIDR[31:0].
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCTRACEIDR are RES0.

**Attributes**
TRCTRACEIDR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:7</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>6:0</td>
<td>TRACEID</td>
</tr>
</tbody>
</table>

**TRCEID, bits [6:0]**
Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.
If an implementation supports AMBA ATB, then:
- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.
The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCTRACEIDR:**
Must be programmed if implemented.
Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.
TRCTRACEIDR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x040</td>
<td>TRCTRACEIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.73 TRCTSCTLR, Timestamp Control Register

The TRCTSCTLR characteristics are:

**Purpose**

Controls the insertion of global timestamps in the trace stream.

**Configurations**

External register TRCTSCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCTSCTLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR0.TSSIZE != 0b0000. Otherwise, direct accesses to TRCTSCTLR are RES0.

**Attributes**

TRCTSCTLR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>EVENT_SEL</td>
<td>EVENT_TYPE</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**EVENT_TYPE, bit [7]**

*When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

0b0 A single Resource Selector. TRCTSCTLR.EVENT_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

0b1 A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT_SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [6:5]**

Reserved, RES0.

**EVENT_SEL, bits [4:0]**

*When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.
Selecting Resource Selector pair 0 using this field is **UNPREDICTABLE**, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the TRCTSCTRLR:**

Must be programmed if `TRCCONFIGR.TS == 1`.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

`TRCTSCTRLR` can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x030</td>
<td>TRCTSCTRLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `OSLockStatus()`, or `! AllowExternalTraceAccess()` or `! IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
**H9.3.74 TRCVICTLR, ViewInst Main Control Register**

The TRCVICTLR characteristics are:

**Purpose**

Controls instruction trace filtering.

**Configurations**

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVICTLR[31:0]. This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCVICTLR are RES0.

**Attributes**

TRCVICTLR is a 32-bit register.

**Field descriptions**

![Register Diagram]

**Bits [31:27]**

Reserved, RES0.

**EXLEVEL_RL_EL2, bit [26]**

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

- **0b0** When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state.
- **0b1** When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EXLEVEL_RL_EL1, bit [25]**

When TRCIDR6.EXLEVEL_RL_EL1 == 1:

Filter instruction trace for EL1 in Realm state.

- **0b0** When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state.
When TRCVICCTRL.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.

0b1 When TRCVICCTRL.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state.
When TRCVICCTRL.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]

When TRCIDR6.EXLEVEL_RL_EL0 == 1:
Filter instruction trace for EL0 in Realm state.

0b0 When TRCVICCTRL.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state.
When TRCVICCTRL.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.

0b1 When TRCVICCTRL.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state.
When TRCVICCTRL.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bit [23]
Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

When Non-secure EL2 is implemented:
Filter instruction trace for EL2 in Non-secure state.

0b0 The trace unit generates instruction trace for EL2 in Non-secure state.
0b1 The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:
Filter instruction trace for EL1 in Non-secure state.

0b0 The trace unit generates instruction trace for EL1 in Non-secure state.
0b1 The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
EXLEVEL_NS_EL0, bit [20]

*When Non-secure EL0 is implemented:*

Filter instruction trace for EL0 in Non-secure state.

- **0b0** The trace unit generates instruction trace for EL0 in Non-secure state.
- **0b1** The trace unit does not generate instruction trace for EL0 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

*When EL3 is implemented:*

Filter instruction trace for EL3.

- **0b0** The trace unit generates instruction trace for EL3.
- **0b1** The trace unit does not generate instruction trace for EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

*When EL2 is implemented and FEAT_SEL2 is implemented:*

Filter instruction trace for EL2 in Secure state.

- **0b0** The trace unit generates instruction trace for EL2 in Secure state.
- **0b1** The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]

*When Secure EL1 is implemented:*

Filter instruction trace for EL1 in Secure state.

- **0b0** The trace unit generates instruction trace for EL1 in Secure state.
- **0b1** The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]

*When Secure EL0 is implemented:*

Filter instruction trace for EL0 in Secure state.

- **0b0** The trace unit generates instruction trace for EL0 in Secure state.
- **0b1** The trace unit does not generate instruction trace for EL0 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bits [15:12]
Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCTR == 1:
Controls the forced tracing of System Error exceptions.

0b0 Forced tracing of System Error exceptions is disabled.
0b1 Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

0b0 Forced tracing of PE Resets is disabled.
0b1 Forced tracing of PE Resets is enabled.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

0b0 Stopped State.
The ViewInst start/stop function is in the stopped state.
0b1 Started State.
The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
• RES1 if all of the following are true:
  — TRCIDR4.NUMACPAIRS == 0b0000
  — TRCIDR4.NUMPC == 0b0000
• Otherwise, access to this field is RW
Bit [8]
Reserved, RES0.

**EVENT_TYPE, bit [7]**

*When TRCIDR4.NUMRSPAIR != 0b0000:*

Chooses the type of Resource Selector.

- **0b0** A single Resource Selector.
  
  TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.

- **0b1** A Boolean-combined pair of Resource Selectors.

  TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- **On a Trace unit reset, this field resets to an architecturally UNKNOWN value.**

*Otherwise:*

Reserved, RES0.

Bits [6:5]
Reserved, RES0.

**EVENT_SEL, bits [4:0]**

*When TRCIDR4.NUMRSPAIR != 0b0000:*

**EVENT_SEL**

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- **On a Trace unit reset, this field resets to an architecturally UNKNOWN value.**

*When TRCIDR4.NUMRSPAIR == 0b0000:*

**Reserved**

This field is reserved:

- **Bits [4:1] are RES0.**
- **Bit [0] is RES1.**

*Otherwise:*

Reserved, RES0.

**Accessing the TRCVICTLR:**

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.
TRCVICTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x80</td>
<td>TRCVICTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.75 TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address RangeComparators for the ViewInst include/exclude function.

Configurations

External register TRCVIIECTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVIIECTLR[31:0].

This register is present only when FEAT ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVIIECTLR are RES0.

Attributes

TRCVIIECTLR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th></th>
<th>31</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

</tr>
</thead>
</table>

Bits [31:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

0b0 The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.

0b1 The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.
The ViewInst exclude function then indicates which ranges are excluded.

0b0  The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.

0b1  The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVIIECTLR:**

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIIECTLR can be accessed through the external debug interface:

<table>

<tbody>
<tr>
<td>ETE</td>
<td>0x084</td>
<td>TRCVIIECTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

- Otherwise accesses to this register are RW.
H9.3.76 TRCVIPCSSCTL, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTL characteristics are:

**Purpose**
Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

**Configurations**
External register TRCVIPCSSCTL bits [31:0] are architecturally mapped to AArch64 System register TRCVIPCSSCTL[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMPC) > 0. Otherwise, direct accesses to TRCVIPCSSCTL are RES0.

**Attributes**
TRCVIPCSSCTL is a 32-bit register.

**Bits [31:24]**
Reserved, RES0.

**STOP[<m>], bit [m+16], for m = 7 to 0**
Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of stopping trace.

- **0b0** The PE Comparator Input <m>, is not selected as a stop resource.
- **0b1** The PE Comparator Input <m>, is selected as a stop resource.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**
Reserved, RES0.

**START[<m>], bit [m], for m = 7 to 0**
Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of starting trace.

- **0b0** The PE Comparator Input <m>, is not selected as a start resource.
- **0b1** The PE Comparator Input <m>, is selected as a start resource.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVIPCSSCTL:**
Must be programmed if TRCIDR4.NUMPC != 0b0000.
Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

TRCVIPCSSCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x08C</td>
<td>TRCVIPCSSCTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.77  TRCVISSCTRL, ViewInst Start/Stop Control Register

The TRCVISSCTRL characteristics are:

**Purpose**

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

**Configurations**

External register TRCVISSCTRL bits [31:0] are architecturally mapped to AArch64 System register TRCVISSCTRL[31:0].

This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVISSCTRL are RES0.

**Attributes**

TRCVISSCTRL is a 32-bit register.

**Field descriptions**

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

0b0  The Single Address Comparator <m>, is not selected as a stop resource.
0b1  The Single Address Comparator <m>, is selected as a stop resource.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

* On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

0b0  The Single Address Comparator <m>, is not selected as a start resource.
0b1  The Single Address Comparator <m>, is selected as a start resource.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

* On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Accessing the TRCVISSCTRL:

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVISSCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x088</td>
<td>TRCVISSCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSlockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
H9.3.78 TRCVMIDCCTLR0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLR0 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=0-3.

**Configurations**

External register TRCVMIDCCTLR0 bits [31:0] are architecturally mapped to AArch64 System register TRCVMIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x0 and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR0 are RES0.

**Attributes**

TRCVMIDCCTLR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>23</th>
<th>16</th>
<th>15</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP3[m]</td>
<td></td>
<td>COMP2[m]</td>
<td></td>
<td>COMP1[m]</td>
<td></td>
<td>COMP0[m]</td>
<td></td>
</tr>
</tbody>
</table>

**COMP3[m], bit [m+24], for m = 7 to 0**

*When UInt(TRCIDR4.NUMVMIDC) > 3:*

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

0b0 The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

* On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COMP2[m], bit [m+16], for m = 7 to 0**

*When UInt(TRCIDR4.NUMVMIDC) > 2:*

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

0b0 The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1 The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

* On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
COMP1[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

0b0   The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1   The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP0[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

0b0   The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1   The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:

• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCVMIDCCTLR0:

If software uses the TRCVMIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x688</td>
<td>TRCVMIDCCTLR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

• Otherwise accesses to this register are RW.
H9.3.79 TRCVMIDCCTRL1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTRL1 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<\text{n}> registers, where n=4-7.

**Configurations**

External register TRCVMIDCCTRL1 bits [31:0] are architecturally mapped to AArch64 System register TRCVMIDCCTRL1[31:0].

This register is present only when FEAT ETE is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x4 and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTRL1 are RES0.

**Attributes**

TRCVMIDCCTRL1 is a 32-bit register.

<tr>
<td>28-24</td>
<td>COMP6[m]</td>
<td>Virtual Context Identifier Comparator mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.</td>
</tr>
<tr>
<td>16-15</td>
<td>COMP5[m]</td>
<td>Virtual Context Identifier Comparator mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.</td>
</tr>
<tr>
<td>8-7</td>
<td>COMP4[m]</td>
<td>Virtual Context Identifier Comparator mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.</td>
</tr>
</tbody>
</table>

**COMP7[m], bit [m+24], for m = 7 to 0**

*When UInt(TRCIDR4.NUMVMIDC) > 7:*

- The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
- The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**COMP6[m], bit [m+16], for m = 7 to 0**

*When UInt(TRCIDR4.NUMVMIDC) > 6:*

- The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
- The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:
- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
COMP5[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

0b0  The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1  The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:
•  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COMP4[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

0b0  The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

0b1  The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

The reset behavior of this field is:
•  On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCVMIDCCTRL1:

If software uses the TRCVMIDCVR<n> registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTRL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x68C</td>
<td>TRCVMIDCCTRL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

•  When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

•  Otherwise accesses to this register are RW.
H9.3.80  TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

**Purpose**
Contains the Virtual Context Identifier Comparator value.

**Configurations**
External register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCVMIDCVR<n>[63:0].
This register is present only when FEAT_ETE is implemented and UInt(TRCIDR4.NUMVMIDC) > n. Otherwise, direct accesses to TRCVMIDCVR<n> are RES0.

**Attributes**
TRCVMIDCVR<n> is a 64-bit register.

**Field descriptions**

VALUE, bits [63:0]
Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier.
The reset behavior of this field is:
• On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCVMIDCVR<n>:
Must be programmed if any of the following are true:
• TRCRSCTLR<n>.GROUP == 0b0111 and TRCRSCTLR<n>.VMID[n] == 1.
• TRCACATR<n>.CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<n>.CONTEXT == n.

TRCVMIDCVR<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x640 + (8 * n)</td>
<td>TRCVMIDCVR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
H9.4 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.
H9.4.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

**Purpose**

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

--- **Note** ---

The architecturally-defined triggers must not be multiplexed.

**Configurations**

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

**Attributes**

ASICCTL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

**Accessing the ASICCTL:**

ASICCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x144</td>
<td>ASICCTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.

- Otherwise accesses to this register are IMPDEF.
H9.4.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

**Purpose**
Clears the application triggers.

**Configurations**
CTIAPPCLEAR is in the Debug power domain.

**Attributes**
CTIAPPCLEAR is a 32-bit register.

**Field descriptions**

APPCLEAR<x>, bit [x], for x = 31 to 0
Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDVID.NUMCHAN field.

Writing to this bit has the following effect:

- **0b0**: No effect.
- **0b1**: Clear corresponding application trigger to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPULSE.

**Accessing the CTIAPPCLEAR:**

CTIAPPCLEAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x018</td>
<td>CTIAPPCLEAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
• When !SoftwareLockStatus() accesses to this register are WO.
### H9.4.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

**Purpose**
Causes event pulses to be generated on ECT channels.

**Configurations**
CTIAPPPULSE is in the Debug power domain.

**Attributes**
CTIAPPPULSE is a 32-bit register.

**Field descriptions**

**APPPULSE<\textit{x}>, bit \!<\textit{x}>!, for \textit{x} = 31 to 0**
Generate event pulse on ECT channel \!<\textit{x}>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

- \(0b0\): No effect.
- \(0b1\): Channel \!<\textit{x}> event pulse generated.

**Note**
- The CTIAPPPULSE operation does not affect the state of the application trigger. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

**Accessing the CTIAPPPULSE:**

It is **CONSTRAINED UNPREDICTABLE** whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.
CTIAPPPULSE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x01c</td>
<td>CTIAPPPULSE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
H9.4.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose
Sets the application triggers.

Configurations
CTIAPPSET is in the Debug power domain.

Attributes
CTIAPPSET is a 32-bit register.

Field descriptions

APPSET<x>, bit [x], for x = 31 to 0
Application trigger <x> enable.

0b0 Reading this means the application trigger is inactive. Writing this has no effect.
0b1 Reading this means the application trigger is active. Writing this sets the corresponding
application trigger to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the
debugger must only use CTIAPPPULSE.

The reset behavior of this field is:

• On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIAPPSET:
CTIAPPSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x14</td>
<td>CTIAPPSET</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.4.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configurations

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>28 - 27</th>
<th>24 - 23</th>
<th>16 - 15</th>
<th>12 - 11</th>
<th>8 - 7</th>
<th>4 - 3</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RAZ</td>
<td>RES0</td>
<td>RAZ</td>
<td>RES0</td>
<td>RAZ</td>
<td>NSNID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:28]

Reserved, RES0.

Bits [27:24]

Reserved, RAZ.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RAZ.

Bits [11:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.
Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB8</td>
<td>CTIAUTHSTATUS</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

**Purpose**
Provides the raw status of the ECT channel inputs to the CTI.

**Configurations**
CTICHINSTATUS is in the Debug power domain.

**Attributes**
CTICHINSTATUS is a 32-bit register.

**Field descriptions**

CHIN<n>, bit [n], for n = 31 to 0
Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

0b0 Input channel <n> is inactive.
0b1 Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

**Accessing the CTICHINSTATUS:**
CTICHINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x138</td>
<td>CTICHINSTATUS</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

**Purpose**
Provides the status of the ECT channel outputs from the CTI.

**Configurations**
CTICHOUTSTATUS is in the Debug power domain.

**Attributes**
CTICHOUTSTATUS is a 32-bit register.

**Field descriptions**

CHOUT<\(n\)>, bit \([n]\), for \(n = 31\) to \(0\)
Output channel \(<n>\) status.

Bits \([31:N]\) are RAZ, \(N\) is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

- **0b0**: Output channel \(<n>\) is inactive.
- **0b1**: Output channel \(<n>\) is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

--- **Note** ---

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

---

**Accessing the CTICHOUTSTATUS:**

CTICHOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x13C</td>
<td>CTICHOUTSTATUS</td>
</tr>
</tbody>
</table>
Accesses to this interface are RO.
H9.4.8   CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see About the Component Identification scheme on page K6-11699.

Configurations

CTICIDR0 is in the Debug power domain.
Implementation of this register is OPTIONAL.
This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRMBL_0, bits [7:0]</td>
<td>Preamble. Reads as 0x0D. Access to this field is RO.</td>
</tr>
</tbody>
</table>

Accessing the CTICIDR0:

CTICIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF0</td>
<td>CTICIDR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

CTICIDR1 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>

Accesses to this interface are RO.
H9.4.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

**Purpose**

- Provides information to identify a CTI component.
- For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

- CTICIDR2 is in the Debug power domain.
- Implementation of this register is **OPTIONAL**.
- This register is required for CoreSight compliance.

**Attributes**

- CTICIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>

**Bits [31:8]**

- Reserved, RES0.

**PRMBL_2, bits [7:0]**

- Preamble.
- Reads as 0x05.
- Access to this field is **RO**.

**Accessing the CTICIDR2:**

CTICIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF8</td>
<td>CTICIDR2</td>
</tr>
</tbody>
</table>

Accesses to this interface are **RO**.
H9.4.11  CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:0</td>
<td>PRMBL_3, Preamble. Reads as 0xB1. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the CTICIDR3:**

CTICIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFC</td>
<td>CTICIDR3</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.12 CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

**Configurations**

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTICLAIMCLR is a 32-bit register.

**Field descriptions**

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag clear bit.

Reads return the value of CLAIM<x>, writes have the following behavior:

- **0b0** No action.
- **0b1** Indirectly clear CLAIM<x> to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

The reset behavior of this field is:

- An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMCLR:**

CTICLAIMCLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA4</td>
<td>CTICLAIMCLR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.4.13  **CTICLAIMSET, CTI CLAIM Tag Set register**

The CTICLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Configurations**

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTICLAIMSET is a 32-bit register.

**Field descriptions**

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CLAIM31 | CLAIM30 | CLAIM29 | CLAIM28 | CLAIM27 | CLAIM26 | CLAIM25 | CLAIM24 | CLAIM23 | CLAIM22 | CLAIM21 | CLAIM20 | CLAIM19 | CLAIM18 | CLAIM17 | CLAIM16 | CLAIM15 | CLAIM14 | CLAIM13 | CLAIM12 | CLAIM11 | CLAIM10 | CLAIM9 | CLAIM8 | CLAIM7 | CLAIM6 | CLAIM5 | CLAIM4 | CLAIM3 | CLAIM2 | CLAIM1 | CLAIM0 |

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

If x is less than the IMPLEMENTATION DEFINED number of CLAIM tags, this field is RAO and the behavior on writes is:

0b0  No action.

0b1  Indirectly set CLAIM<x> tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

The reset behavior of this field is:

- An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMSET:**

CTICLAIMSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
<td>CTICLAIMSET</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.4.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

**Purpose**

Controls whether the CTI is enabled.

**Configurations**

CTICONTROL is in the Debug power domain.

**Attributes**

CTICONTROL is a 32-bit register.

**Field descriptions**

![Register Diagram]

**Bits [31:1]**

Reserved, RES0.

**GLBEN, bit [0]**

Enables or disables the CTI mapping functions. Possible values of this field are:

0b0   CTI mapping functions and application trigger disabled.
0b1   CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is **CONSTRAINED UNPREDICTABLE** which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

**Accessing the CTICONTROL:**

CTICONTROL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x0000</td>
<td>CTICONTROL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.4.15 CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Configurations**

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Attributes**

CTIDEVAFF0 is a 32-bit register.

**Field descriptions**

![MPIDR_EL1lo](31 0)

**MPIDR_EL1lo, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the CTIDEVAFF0:**

CTIDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA8</td>
<td>CTIDEVAFF0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

**Purpose**
Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Configurations**
CTIDEVAFF1 is in the Debug power domain.
If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.
Arm recommends that the CTI is CTIv2.
In an Armv8.5 compliant implementation, the CTI must be CTIv2.
If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Attributes**
CTIDEVAFF1 is a 32-bit register.

**Field descriptions**

```
+---------+---------+
| 31      | 0       |
+---------+---------+
MPIDR_EL1hi
```

**MPIDR_EL1hi, bits [31:0]**
MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Accessing the CTIDEVAFF1:**
CTIDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFAC</td>
<td>CTIDEVAFF1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the CTI component.

**Configurations**

CTIDEVARCH is in the Debug power domain.

- If the CTI is CTIv1, this register is **optional**. If the CTI is CTIv2, this register is mandatory.
- Arm recommends that the CTI is CTIv2.
- In an Armv8.5 compliant implementation, the CTI must be CTIv2.
- If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

**Attributes**

CTIDEVARCH is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:21 ARCHITECT</td>
<td>Defines the architecture of the component. For CTI, this is Arm Limited.</td>
</tr>
<tr>
<td>20 PRESENT</td>
<td>Indicates that the DEVARCH is present.</td>
</tr>
</tbody>
</table>
| 19:16 REVISION | Defines the architecture revision of the component. When FEAT_DoPD is implemented: 

- 0b0000 First revision.
- 0b0001 As 0b0000, and also adds support for CTIDEVCTL.
- All other values are reserved.

This field has an **IMPLEMENTATION DEFINED** value.

Access to this field is RO.

**Otherwise:**

- Revision.
- Defines the architecture revision of the component.
- All other values are reserved.
Reads as 0b0000.
Access to this field is RO.

**ARCHID, bits [15:0]**

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:
- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.
Reads as 0xA14.
Access to this field is RO.

**Accessing the CTIDEVARCH:**

CTIDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF8C</td>
<td>CTIDEVARCH</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

**Purpose**

Provides target-specific device controls

**Configurations**

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

**Attributes**

CTIDEVCTL is a 32-bit register.

**Field descriptions**

![Field descriptions diagram]

**Bits [31:2]**

Reserved, RES0.

**RCE, bit [1]**

Reset Catch Enable.

0b0 Reset Catch debug event disabled.
0b1 Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

**OSUCE, bit [0]**

OS Unlock Catch Enable

0b0 OS Unlock Catch debug event disabled.
0b1 OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

**Accessing the CTIDEVCTL:**

CTIDEVCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x150</td>
<td>CTIDEVCTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.4.19 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

**Purpose**

Describes the CTI component to the debugger.

**Configurations**

CTIDEVID is in the Debug power domain.

**Attributes**

CTIDEVID is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>18</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>NUMCHAN</td>
<td>RES0</td>
<td>NUMTRIG</td>
<td>RES0</td>
<td>EXTNUMNUM</td>
<td>INOUT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:26]**

Reserved, RES0.

**INOUT, bits [25:24]**

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

- 0b00 **CTIGATE** does not mask propagation of input events from external channels.
- 0b01 **CTIGATE** masks propagation of input events from external channels.

All other values are reserved.

**Bits [23:22]**

Reserved, RES0.

**NUMCHAN, bits [21:16]**

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Bits [15:14]**

Reserved, RES0.

**NUMTRIG, bits [13:8]**

Upper bound for number of triggers. The indices of all implemented input and output triggers are less than this value.
All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that all of the input and output triggers, including the highest numbered, are connected to any components, or that the implementation of input and output triggers is symmetrical.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Bits [7:5]**

Reserved, RES0.

**EXTMUXNUM, bits [4:0]**

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Accessing the CTIDEVID:**

CTIDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC8</td>
<td>CTIDEVID</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.20  CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

**Purpose**
Reserved for future information about the CTI component to the debugger.

**Configurations**
CTIDEVID1 is in the Debug power domain.

**Attributes**
CTIDEVID1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
</table>

**Accessing the CTIDEVID1:**
CTIDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC4</td>
<td>CTIDEVID1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.21 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

**Purpose**
Reserved for future information about the CTI component to the debugger.

**Configurations**
CTIDEVID2 is in the Debug power domain.

**Attributes**
CTIDEVID2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
</table>

Accessing the CTIDEVID2:

CTIDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC0</td>
<td>CTIDEVID2</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.22  CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose
Indicates to a debugger that this component is part of a PEs cross-trigger interface.

Configurations
CTIDEVTYPE is in the Debug power domain.
Implementation of this register is OPTIONAL.

Attributes
CTIDEVTYPE is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td>0000</td>
</tr>
<tr>
<td>7-4</td>
<td>Subtype, SUB</td>
<td>0001</td>
</tr>
<tr>
<td>3-0</td>
<td>Major Type, MAJOR</td>
<td>0100</td>
</tr>
</tbody>
</table>

Bits [31:8]
Reserved, RES0.

SUB, bits [7:4]
Subtype. Indicates this is a component within a PE.
Reads as 0b0001.
Access to this field is RO.

MAJOR, bits [3:0]
Major type. Indicates this is a cross-trigger component.
Reads as 0b0100.
Access to this field is RO.

Accessing the CTIDEVTYPE:
CTIDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFCC</td>
<td>CTIDEVTYPE</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.23  **CTIGATE, CTI Channel Gate Enable register**

The CTIGATE characteristics are:

**Purpose**

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

**Configurations**

CTIGATE is in the Debug power domain.

**Attributes**

CTIGATE is a 32-bit register.

**Field descriptions**

GATE\(<x>\), bit \([x]\), for \(x = 31\) to \(0\)

Channel \(<x>\) gate enable.

Bits \([31: N]\) are RAZ/WI. \(N\) is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

- **0b0** Disable output and, if CTIDEVID.INOUT == 0b01, input channel \(<x>\) propagation.
- **0b1** Enable output and, if CTIDEVID.INOUT == 0b01, input channel \(<x>\) propagation.

If GATE\(<x>\) is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIGATE:**

CTIGATE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x140</td>
<td>CTIGATE</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `SoftwareLockStatus()` accesses to this register are RO.
- When `!SoftwareLockStatus()` accesses to this register are RW.
H9.4.24  CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

**Purpose**

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

**Configurations**

CTIINEN<n> is in the Debug power domain.

If input trigger n is not implemented or not connected, CTIINEN<n> is RES0.

**Attributes**

CTIINEN<n> is a 32-bit register.

**Field descriptions**

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

- 0b0 Input trigger <n> will not generate an event on output channel <x>.
- 0b1 Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIINEN<n>:**

CTIINEN<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x820 + (4 * n)</td>
<td>CTIINEN&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
• When !SoftwareLockStatus() accesses to this register are RW.
**H9.4.25  CTIINTACK, CTI Output Trigger Acknowledge register**

The CTIINTACK characteristics are:

**Purpose**
Can be used to deactivate the output triggers.

**Configurations**
CTIINTACK is in the Debug power domain.

**Attributes**
CTIINTACK is a 32-bit register.

**Field descriptions**

---

**ACK<n>, bit [n], for n = 31 to 0**

Acknowledge for output trigger <n>.  
Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.  

If any of the following is true, writes to ACK<n> are ignored:

- n \(\geq\) CTIDEVID.NUMTRIG, the number of implemented triggers.  
- Output trigger n is not active.  
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, ACK<n> is RES0:

- Output trigger n is not implemented.  
- Output trigger n is not connected.  
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

- 0b0  No effect  
- 0b1  Deactivate the trigger.
**Accessing the CTIINTACK:**

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x10</td>
<td>CTIINTACK</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
H9.4.26  CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

**Purpose**

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configurations**

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTIITCTRL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>IME, Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

0b0 Normal operation.

0b1 Integration mode enabled.

The reset behavior of this field is:

- The following resets apply:
  - If the register is implemented in the Core power domain:
    - On a Cold reset, this field resets to 0.
    - On an External debug reset, the value of this field is unchanged.
    - On a Warm reset, the value of this field is unchanged.
  - If the register is implemented in the External debug power domain:
    - On a Cold reset, the value of this field is unchanged.
    - On an External debug reset, this field resets to 0.
    - On a Warm reset, the value of this field is unchanged.

**Accessing the CTIITCTRL:**

CTIITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
<td>CTIITCTRL</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
H9.4.27 **CTILAR, CTI Lock Access Register**

The CTILAR characteristics are:

**Purpose**

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILAR is a 32-bit register.

**Field descriptions**

*When Software Lock is implemented:*

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>KEY</td>
</tr>
</tbody>
</table>

**KEY, bits [31:0]**

Lock Access control. Writing the key value \(0xC5ACCE55\) to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

Otherwise

**Bits [31:0]**

Reserved, RES0.

**Accessing the CTILAR:**

CTILAR can be accessed through a memory-mapped interface access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF80</td>
<td>CTILAR</td>
</tr>
</tbody>
</table>

Accesses to this interface are WO.
H9.4.28   CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

**Purpose**

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILSR is a 32-bit register.

**Field descriptions**

![Field descriptions diagram]

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value 0x01</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>nTT, bit [2]</td>
<td>Not thirty-two bit access required. RAZ.</td>
</tr>
<tr>

<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>SLI, bit [0]</td>
<td>Otherwise:</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RAZ</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

*When Software Lock is implemented:*

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

- 0b0 Lock clear. Writes are permitted to this component's registers.
- 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

*Otherwise:*

Reserved, RAZ.

**SLI, bit [0]**

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.
Accessing the CTILSR:

CTILSR can be accessed through a memory-mapped interface access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF84</td>
<td>CTILSR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.29 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

**Purpose**

Defines which input channels generate output trigger n.

**Configurations**

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not implemented or not connected, CTIOUTEN<n> is RES0.

**Attributes**

CTIOUTEN<n> is a 32-bit register.

**Field descriptions**

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

- 0b0 An event on input channel <x> will not cause output trigger <n> to be asserted.
- 0b1 An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIOUTEN<n>:**

CTIOUTEN<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xA0 + (4 * n)</td>
<td>CTIOUTEN&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `SoftwareLockStatus()` accesses to this register are RO.
- When `!SoftwareLockStatus()` accesses to this register are RW.
H9.4.30  CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose
Provides information to identify a CTI component.
For more information, see About the Peripheral identification scheme on page K6-11696.

Configurations
CTIPIDR0 is in the Debug power domain.
Implementation of this register is OPTIONAL.
This register is required for CoreSight compliance.

Attributes
CTIPIDR0 is a 32-bit register.

Field descriptions

| Bits [31:8] | RESERVED, RES0 |
| PART_0, bits [7:0] | PART_0 |

Accessing the CTIPIDR0:
CTIPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE0</td>
<td>CTIPIDR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.31 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.
For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

CTIPIDR1 is in the Debug power domain.
Implementation of this register is OPTIONAL.
This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

**Field descriptions**

H9.4.32 CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see "About the Peripheral identification scheme on page K6-11696."

**Configurations**

CTIPIDR2 is in the Debug power domain.

Implementation of this register is *OPTIONAL*.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR2 is a 32-bit register.

**Field descriptions**

H9.4.34   CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

**Field descriptions**

![Field Descriptions Diagram](image)

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the CTIPIDR4:**

CTIPIDR4 can be accessed through the external debug interface:

H9.4.35   CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

**Purpose**

Provides the status of the trigger inputs.

**Configurations**

CTITRIGINSTATUS is in the Debug power domain.

**Attributes**

CTITRIGINSTATUS is a 32-bit register.

**Field descriptions**

TRIN<\(n\)>, bit [\(n\)], for \(n = 31\) to 0

Trigger input <\(n\)> status.

Bits [31:N] are RAZ. \(N\) is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

0b0 Input trigger \(n\) is inactive.

0b1 Input trigger \(n\) is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

**Accessing the CTITRIGINSTATUS:**

CTITRIGINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x130</td>
<td>CTITRIGINSTATUS</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
H9.4.36  CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

**Purpose**

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicyle channel events.

**Configurations**

CTITRIGOUTSTATUS is in the Debug power domain.

**Attributes**

CTITRIGOUTSTATUS is a 32-bit register.

**Field descriptions**

TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in CTIDEVID.NUMTRIG.

If n < N, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicyle channel events, then permitted values for TROUT<n> are:

0b0  Output trigger n is inactive.
0b1  Output trigger n is active.

Otherwise when n < N it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

**Accessing the CTITRIGOUTSTATUS:**

CTITRIGOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x134</td>
<td>CTITRIGOUTSTATUS</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
Part I

Memory-mapped Components of the Arm Architecture
Chapter I1
Requirements for Memory-mapped Components

This chapter provides some additional information about memory-mapped components. It contains the following sections:

- Supported access sizes on page I1-10716.
- Synchronization of memory-mapped registers on page I1-10718.
- Access requirements for reserved and unallocated registers on page I1-10720.
I1.1 Supported access sizes

The information in this section applies to all accesses to memory-mapped components of the Armv8 and later architectures, unless a register or component description explicitly states otherwise.

The memory access sizes that are supported by any peripheral are IMPLEMENTATION DEFINED by the peripheral.

When `HaveSecureExtDebugView() == TRUE`, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

An implementation of a memory-mapped component that is compatible with the Armv8 and later architectures must support the following:

- Word-aligned 32-bit accesses to access 32-bit registers.
- If the system includes any component with direct memory access to the memory-mapped component which needs to access the component but does not support making 64-bit accesses, word-aligned 32-bit accesses to either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations. This includes, but is not limited to:
  - A PE that supports AArch32 at any Exception level.
  - A PE that implements a 32-bit ISA that does not include 64-bit memory operations. For example, Armv8-M T32.
  - A Debug Access Port that cannot make 64-bit accesses.

Arm deprecates support for 32-bit accesses to either half of 64-bit registers.

**Note**

Although AArch32 implementations might make 64-bit accesses for `LDP` and `STP` instructions, this is not architecturally required. To guarantee ordering of accesses, portable AArch32 software should use `LDR` and `STR`. For compatibility with such software, the memory-mapped component should treat the PE that supports AArch32 as not making 64-bit accesses using portable code.

**Note**

Some memory-mapped components of the Arm architecture require support for word-aligned 32-bit accesses to either half of a 64-bit memory mapped register even if all components with direct memory access to the memory-mapped component support making 64-bit accesses. These include:

- The memory-mapped interface to the external debug and CTI registers that are described in Chapter H9 External Debug Register Descriptions.
- The memory-mapped interfaces to the Generic Timer registers that are described in Chapter I2 System Level Implementation of the Generic Timer.
- When the 64-bit external PMU programmers’ model extension is not implemented, the memory-mapped interfaces to the Performance Monitors registers that are described in Chapter I3 Recommended External Interface to the Performance Monitors.
- The memory-mapped interfaces to the Activity Monitors registers that are described in Chapter I4 Recommended External Interface to the Activity Monitors.

- Doubleword-aligned 64-bit accesses to access 64-bit registers that are mapped to a doubleword-aligned pair of adjacent 32-bit locations.

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte accesses.
- Halfword accesses.
- Unaligned word accesses. These accesses are not word single-copy atomic.
- Unaligned doubleword accesses. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair that forms a 64-bit register.
• Quadword accesses or higher accesses.
• Exclusive accesses.

For unsupported accesses, it is **CONSTRAINED UNPREDICTABLE** whether:
• The access generates an External abort or not.
• The defined side-effects of a read occur or not. A read returns **UNKNOWN** values.
• A write is ignored or sets the accessed register or registers to **UNKNOWN**.
• The access generates a fault handling interrupt or not. A read returns **UNKNOWN** data.

For memory-mapped accesses from a PE that complies with an Arm architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory that is accessed, determine the size of the access that is made by an instruction. **Example 11-1** shows this.

---

**Example 11-1 Access sizes for memory-mapped accesses**

Two Load Doubleword instructions that are made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

---

The Arm architecture does not require the size of each element that is accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Unless otherwise specified by the component, any access to a memory-mapped component of the Arm architecture is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory type, and only single register load and store instructions, to create memory accesses that are supported by the peripheral. For more information, see **Memory types and attributes on page B2-196.**
11.2 Synchronization of memory-mapped registers

This section describes the synchronization requirements for the memory-mapped accesses to System registers.

This section refers to accesses to external system control registers as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

Note

Synchronization requirements for AArch64 System registers on page D17-5547 and Synchronization of changes to AArch32 System registers on page G8-9326 define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. Unless otherwise stated, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible as external system control registers.

Unless required to be observable to all observers in finite time, without explicit synchronization, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a Context synchronization event.
- The Context synchronization event was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by:

- Synchronization requirements for AArch64 System registers on page D17-5547.
- Synchronization of changes to AArch32 System registers on page G8-9326.

The external agent must be able to guarantee completion of a write. For example, the agent can:

- Mark the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- If the register is read/write and reads are not destructive, read back the value written.
- Use some guaranteed property of the connection between the PE and the external agent.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the Context synchronization event, and relying on the memory ordering rules provided by the memory model.

External reads and external write complete in the order in which they arrive at the PE. For accesses to different register locations, the external agent must create this order. The agent can:

- Mark the memory as Device-nGnRnE or Device-nGnRE.
- Use the appropriate memory barriers.
- Rely on some guaranteed property of the connection between the PE and the external agent.

However, the external agent cannot force the synchronization of completed writes.

In a simple sequential execution, an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.
For example, some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means the simultaneous writes must be merged.
I1.3 Access requirements for reserved and unallocated registers

This section describes the access requirements for reserved and unallocated memory-mapped components.

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
  - OPTIONAL features that are not implemented.
  - Breakpoints and watchpoints that are not implemented.
  - Performance Monitors counters that are not implemented.
  - CTI triggers that are not implemented.
  - Error records that are not implemented.
  These accesses are reserved.
- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses are normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture. Software must treat reserved accesses as RES0.
Chapter I2
System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- About the Generic Timer specification on page I2-10722.
- Memory-mapped counter module on page I2-10724.
- Memory-mapped timer components on page I2-10728.

Note
- Generic Timer memory-mapped register descriptions on page I5-10875 describes the System level Generic Timer registers. These registers are memory-mapped.

- Appendix K Additional Information for Implementations of the Generic Timer gives additional information, that does not form part of the architectural definition of a system level implementation of the Generic Timer.

- Chapter D10 The Generic Timer in AArch64 state gives a general description of the AArch64 state view of the Generic Timer, and describes the AArch64 System register interface to the Generic Timer.

- Chapter G6 The Generic Timer in AArch32 state gives a general description of the AArch32 state view of the Generic Timer, and describes the AArch32 System register interface to the Generic Timer.
I2.1 About the Generic Timer specification

Chapter D10 The Generic Timer in AArch64 state describes the Arm Generic Timer and its implementation as seen from AArch64 state. Chapter G6 The Generic Timer in AArch32 state describes the Arm Generic Timer and its implementation as seen from AArch32 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the Arm Generic Timer architecture also defines a memory-mapped component, that comprises:

- A memory-mapped counter module, that controls the generation of the Count value used by the Generic Timer.
  
  This memory-mapped counter module is required in any Arm Generic Timer implementation that requires software control of the Count value of the Generic Timer.

- Optional memory-mapped timer modules. These give a standardized way of providing timers for programmable system components other than PEs that implement the Arm architecture.

The full set of Generic Timer components on page D10-5233 summarizes these components as seen from AArch64 state, and The full set of Generic Timer components on page G6-9289 summarizes them as seen from AArch32 state. The system level components of the Generic Timer on page I2-10723 summarizes the system level components.

I2.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into frames. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame are IMPLEMENTATION DEFINED.

--- Note ---

The final 12 words of the first or only 4KB block of a register memory frame is an ID block.

--- Note ---

Each frame must be in its own memory page, or memory protection region, and must be aligned to the size of the translation granule or protection granule.

--- Note ---

When a system level implementation of the Generic Timer is accessed by a PE:

- Using a VMSA, each frame is in its own memory page, aligned to the size of the translation granule.

- Using a PMSA, each frame is in its own memory protection region, aligned to the size of the memory protection granule.

---

The following sections give more information about the requirements for the system level Generic Timer component:

- Endianness and supported access sizes.

- Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

Endianness and supported access sizes

All memory-mapped peripherals defined in the Arm architecture must be little-endian. This means the system-level Generic Timer registers, and the register frames, are little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the memory-mapped Generic Timer registers implementations must:

- Comply with the requirements of Supported access sizes on page 11-10716.

- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if all components with direct memory access to the Generic Timer support making 64-bit accesses.
Power and reset domains for the system level implementation of the Generic Timer

The power and reset domains of the system level implementation of the Generic Timer are IMPLEMENTATION DEFINED as part of the system implementation. In register descriptions, they are called Timer resets to indicate they can be outside the PE power and reset domains defined by the remainder of this manual.

The Arm architecture requires that the CNTCR.{FCREQ, EN} and CNTSR.FCACK fields reset to 0. These Timer reset values apply only on powerup of the power domain in which the registers are implemented or a reset of the reset domain in which they are implemented.

Every other register, or register field, of a system level implementation of the Generic Timer resets to a value that is architecturally UNKNOWN if it has a meaningful reset value. These Timer resets apply on powerup of the power domain in which the register is implemented, and on a reset of the reset domain in which it is implemented.

I2.1.2 The system level components of the Generic Timer

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

Memory-mapped counter module on page I2-10724 describes this component.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, CNTCTLBase.

The CNTCTLBase frame on page I2-10728 describes this frame.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the CNTBaseN frame.
- Optionally provides an unprivileged view of the timer in the CNTEL0BaseN frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

The CNTBaseN and CNTEL0BaseN frames on page I2-10729 describes these frames.
I2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The CNTControlBase frame holds the registers for the memory-mapped counter, and provides:

- An RW control register, CNTCR, that provides:
  - An enable bit for the system counter.
  - An enable bit for Halt-on-debug. For more information, see Halt-on-debug on page I2-10726.
  - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. This mechanism means that, for example, if the update frequency is halved, the increment at each update is doubled.
    For more information, see Control of counter operating frequency and increment on page I2-10725.

Writes to this register are rare. In a system that supports two Security states, this register is writable only by Secure writes.

- A RO status register, CNTSR, that provides:
  - A bit that indicates whether the system counter is halted because of an asserted Halt-on-debug signal.
  - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.

- Two contiguous 32-bit RW registers that hold the current system counter value, CNTCV. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.

Writes to these registers are rare. In a system that supports two Security states, these registers are writable only by Secure writes.

- A Frequency modes table of one or more 32-bit entries, where:
  - The first entry in the table defines the base frequency of the system counter. This is the maximum frequency at which the counter updates.
  - Each subsequent entry in the table defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.

A 32-bit zero entry immediately follows the last table entry.

This table can be RO or RW. For more information, see The Frequency modes table on page I2-10725.

In addition, the CNTReadBase frame includes a read-only copy of the system counter value, CNTCV, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

Counter module control and status register summary on page I2-10726 describes CNTReadBase and CNTControlBase memory maps, and the registers in each frame.
I2.2.1 Control of counter operating frequency and increment

The system counter has a fixed base frequency, and must maintain the required counter accuracy, meaning Arm recommends that it does not gain or lose more than ten seconds in a 24-hour period, see The system counter on page D10-5234. However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- The Frequency modes table.
- Changing the system counter and increment.

The Frequency modes table

The Frequency modes table starts at offset 0x20 in the CNTControlBase frame.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system counter is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[ \text{increment} = \frac{\text{base_frequency}}{\text{selected_frequency}} \]

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the Frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the CNTControlBase memory map shows the table region as RO or RW.

Arm strongly recommends that the Frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED, up to this limit.

Note

- Arm considers it likely that implementations will require significantly fewer entries than the architectural limit.
- In the CNTControlBase frame, the offset range 0x0C0-0x0FC can be used for IMPLEMENTATION DEFINED registers. If any registers are defined in this space, then the Frequency modes table cannot extend beyond offset 0x088, with a zero word at offset 0x08C. This means that if any IMPLEMENTATION DEFINED registers are defined the maximum number of entries in the table is 40, including the zero-word end marker.

Changing the system counter and increment

The value of the CNTCR.FCREQ field specifies which entry in the Frequency modes table specifies the system counter update frequency.

Changing the value of CNTCR.FCREQ requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

- When changing from a higher frequency to a lower frequency, the counter:
  1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
  2. Switches to operating at the lower frequency.
• When changing from a lower frequency to a higher frequency, the counter:
  1. Waits until the end of the current lower-frequency cycle.
  2. Makes the counter increment required for operation at that lower frequency.
  3. Switches to operating at the higher frequency.

When the frequency has changed, CNTSR is updated to indicate the new frequency. Therefore, a system component
that is waiting for a frequency change can poll CNTSR to detect the change.

### I2.2.2 Halt-on-debug

The CNTCR register provides an enable bit for an OPTIONAL Halt-on-debug signal.

When the CNTCR.HDBG bit is set to 1, and the Halt-on-debug signal is implemented and asserted, the system
counter is halted. Otherwise, the system counter ignores the state of this signal.

Arm recommends that a system counter implements a Halt-on-debug signal that can be controlled by a debugger
using the Embedded Cross-Trigger (ECT) using a system-level cross-trigger interface that includes:
• A debug request output trigger event that asserts the Halt-on-debug signal.
• A restart request output trigger event that deasserts the Halt-on-debug signal.

For more information, see About the Embedded Cross-Trigger on page H5-10318.

--- Note ---

Software must use the Halt-on-debug enable bit to ensure that the timers cannot be halted maliciously in an attempt
to prohibit progress.

---

For more information about Halt-on-debug, contact Arm.

### I2.2.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory
frames:
• A control frame, with base address CNTControlBase.
• A status frame, with base address CNTReadBase.

Each of these register memory frames is in its own memory page or memory protection region, and the frame base
address points to the start of this region. Each base address must be aligned to the size of the translation granule or
 protection granule.

--- Note ---

Each frame of a memory-mapped Generic Timer takes the name of its base address.

---

In each register memory frame, the memory at offset 0xFD0-0xFFF is reserved for twelve 32-bit IMPLEMENTATION
DEFINED ID registers, see the CounterID<n> register descriptions for more information.

--- Note ---

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the counter is
little-endian.

---

In an implementation that supports Secure and Non-secure memory maps, CNTControlBase is accessible only by
Secure accesses.

Table I2-1 on page I2-10727 shows the CNTControlBase control registers, in order of their offsets from the
CNTControlBase base address, for an implementation that includes registers in the IMPLEMENTATION DEFINED
register space 0x0C0-0x0FC, and also has fewer than 39 CNTFID<n> registers. The Frequency modes table on
page I2-10725 describes how this memory map differs if more CNTFID<n> registers are implemented.
Generic Timer memory-mapped register descriptions on page I5-10875 describes each of these registers.

I2.3 Memory-mapped timer components

This part of the Arm Generic Timer specification defines an optional memory-mapped timer component. This can be implemented as part of any programmable system component that does not incorporate a System register mapped Arm Generic Timer, to provide that system component with the timer functionality of an Arm Generic Timer.

The memory map consists of up to eight timer frames. The base address of a frame is CNTBaseN, where \( N \) numbers from 0 up to a maximum permitted value of 7.

Each CNTBaseN timer frame:
- Provides its own set of timers and associated interrupts.
- Is implemented in its own memory page or memory protection region.
- Is implemented at a base address, identified as CNTBaseN, that is aligned to the size of the translation granule or memory protection region.

For each implemented CNTBaseN frame the system can optionally provide an unprivileged view of the frame, described as the EL0 view of the frame. The base address of this second view of the CNTBaseN frame is CNTEL0BaseN.

--- Note ---

In the naming of the registers associated with a CNTBaseN or CNTEL0BaseN frame, the value of \( N \) is represented as \(<n>\), for example CNTACR\(<n>\).

---

If a CNTEL0BaseN frame is implemented:
- Is implemented in its own memory page or memory protection region and is aligned to the size of the translation granule or memory protection region.
- All registers visible in CNTBaseN, except for CNTVOFF and CNTEL0ACR, can be visible in CNTEL0BaseN.
  - Control fields in CNTEL0ACR determine whether each register is visible.
- The offsets of all visible registers are the same as their offsets in the CNTBaseN frame.

In addition to the implemented CNTBaseN and CNTEL0BaseN frames, the system must provide a single control frame at base address CNTCTLBase. CNTCTLBase must be implemented in its own memory page or memory protection region and is aligned to the size of the translation granule or memory protection region.

The system defines the position of each frame in the memory map. This means the values of each of the CNTBaseN, CNTEL0BaseN, and CNTCTLBase base addresses is IMPLEMENTATION DEFINED.

--- Note ---

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the memory-mapped timers are little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:
- The CNTCTLBase frame.
- The CNTBaseN and CNTEL0BaseN frames on page I2-10729.

--- Note ---

Providing a complete set of features in a system level implementation on page K7-11702 gives an implementation example for a system level Generic Timer implementation that provides equivalent features to a System registers Generic Timer implementation in a PE that includes all of the Exception levels.

I2.3.1 The CNTCTLBase frame

The CNTCTLBase frame contains:
- An identification register for the features of the memory-mapped counter and timer implementation.
- Access controls for each CNTBaseN frame.
- A virtual offset register for frames that implement a virtual timer.
Table I2-3 on page I2-10729 shows the CNTCTLBase registers, in order of their offsets from the CNTCTLBase base address.

--- Note ---
CNTFRQ and CNTVOFF registers are also implemented in a System register interface to the Generic Timer.

---

*Generic Timer memory-mapped register descriptions on page I2-10875* describes each of these registers.

</tbody>
</table>

a. Access security requirement in an implementation that supports two Security states. In an implementation that does not support multiple Security states all registers are accessible as shown in the *Type* column.
b. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D17-7014* and *Generic Timer registers on page G8-10144*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
c. Implemented for each value of N from 0 to 7 for which a CNTBaseN frame is implemented.
d. The CNTNSAR determines the Non-secure accessibility of the CNTACR<n>s and the CNTVOFF<n> in the CNTCTLBase frame. For more information, see the register descriptions.
e. Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic Timer component does not distinguish between real time and virtual time, then it can implement CNTVOFF as RAZ/WI. Otherwise CNTVOFF is an RW register, and Arm strongly recommends that the system only permits access to CNTVOFF from EL2 or higher.

### I2.3.2 The CNTBaseN and CNTEL0BaseN frames

Each CNTBaseN frame, or {CNTBaseN, CNTEL0BaseN} pair of frames, provides a memory-mapped counter and timer, see:
- *The CNTBaseN frame on page I2-10730.*
- *The CNTEL0BaseN frame on page I2-10730.*
- *CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731.*
The CNTBaseN frame

Table I2-4 on page I2-10730 shows the CNTBaseN registers, in order of their offsets from the CNTBaseN base address. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not, then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, equivalent registers are also implemented in a System register interface to the timer component of a Generic Timer.

Generic Timer memory-mapped register descriptions on page I5-10875 describes each of these registers.

a. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in Generic Timer registers on page D17-7014 and Generic Timer registers on page G8-10144. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
b. Address is reserved, RAZ/WI if register not implemented.
c. The CNTCTLBase frame includes an RW view of this register.

The CNTEL0BaseN frame

For any value of N, the layout of the registers in the CNTEL0BaseN frame is identical to the CNTBaseN frame, except that, in the CNTEL0BaseN frame:

- CNTVOFF is never visible, and the memory at 0x018-0x01C is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at 0x14 is RAZ/WI.
• If implemented in the CNTBaseN frame, CNTEL0ACR controls whether CNTPCT, CNTVCT, CNTFRQ, the Physical Timer, and the Virtual Timer registers are visible in the CNTEL0BaseN frame. If CNTEL0ACR is not implemented then these registers are not visible in the CNTEL0BaseN frame, and their addresses in that frame are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then CNTPCT, CNTVCT, CNTVOFF, CNTP_CVAL, and CNTV_CVAL must be accessible as atomic 64-bit values.

CNTCTRLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames

In the CNTCTRLBase frame:

CNTTIDR controls:
- Whether each CNTBaseN frame is implemented.
- If a CNTBaseN frame is implemented, whether:
  - That CNTBaseN frame has virtual timer capability.
  - A corresponding CNTEL0BaseN frame is implemented.

CNTNSAR controls:
In an implementation that recognizes two Security states, determines whether each implemented CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

This control also determines whether, in the CNTCTRLBase frame, the CNTACR<n> and CNTVOFF<n> registers are accessible by Non-secure accesses.

The CNTACR<n> registers control:
For each implemented CNTBaseN frame, the accessibility of the following registers in that frame:
- CNTP_CTL, CNTP_CVAL, and CNTP_TVAL.
- CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.
- CNTVOFF.
- CNTFRQ.
- CNTPCT.
- CNTVCT.

For CNTACR<n>, the value of <n> corresponds to the value of N for the controlled CNTBaseN frame.

The CNTVOFF<n> registers provide:
For each implemented CNTBaseN frame that has virtual capability, the RW copy of the CNTVOFF register for that frame.

——— Note ————
In a CNTBaseN frame that has virtual timer capability the CNTVOFF register is RO.

———
For CNTVOFF<n>, the value of <n> corresponds to the value of N for the controlled CNTBaseN frame.
Chapter I3
Recommended External Interface to the Performance Monitors

This chapter describes the recommended external interface to the Performance Monitors. It contains the following section:
•  About the external interface to the Performance Monitors registers on page I3-10734.

Note

Performance Monitors external register descriptions on page I5-10753 describes the external view of the Performance Monitors registers.
I3.1 About the external interface to the Performance Monitors registers

Arm recommends that:

- An implementation provides the OPTIONAL external debug interface to the Performance Monitors registers.

  Note
  A debugger can use this interface to access counters in the Performance Monitors.

- The implementation includes the OPTIONAL support for memory-mapped access to the External debug interface.

  Note
  — Software running on any PE in a system can use this interface to access counters in the Performance Monitors.
  — Privileged software should use the MMU to control access to this interface.

- The external debug interface is implemented as defined in Appendix K6 Recommended External Debug Interface.

When the 64-bit external PMU programmers’ model extension is implemented, all Performance Monitors registers are 64-bit except the 32-bit CoreSight management registers.

Note
This means that register views in the external debug interface to the Performance Monitors registers are the same size as the register views in the System interface when the PE is using AArch64. The 32-bit external view is not accessible for Performance Monitors registers which are extended to 64 bits.

The following sections describe the memory-mapped views of the Performance Monitors registers:

- Differences in the external views of the Performance Monitors registers on page I3-10735.
- Synchronization of changes to the memory-mapped views on page I3-10736.
- Access permissions for external views of the Performance Monitors on page I3-10736.

In this section, unless the context explicitly indicates otherwise, any reference to a memory-mapped view applies equally to a register view using:

- An access through an external debug interface.
- A memory-mapped access.

I3.1.1 Endianness and supported access sizes

When an implementation supports memory-mapped access to the external debug interface the interface is accessed as a little-endian memory-mapped peripheral. External Performance Monitors registers summary on page I5-10748 gives the memory map of these registers.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the external interface to the Performance Monitors registers implementations must:

- Comply with the requirements of Supported access sizes on page I1-10716.
- When the 64-bit external PMU programmers’ model extension is not implemented, support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if all components with direct memory access to the PMU support making 64-bit accesses.

Permitted word-aligned 32-bit accesses are single-copy atomic at word granularity. When the 64-bit external PMU programmers’ model extension is implemented, permitted doubleword-aligned 64-bit accesses are single-copy atomic at doubleword granularity.
I3.1.2 Differences in the external views of the Performance Monitors registers

An external view of the Performance Monitors registers accesses the same registers as the System registers interface described in Performance Monitors Extension registers on page D11-5428, except that:

- The PMSELR is accessible only in the System registers interface.
- The following registers are accessible only in external views:
  - PMPCSR.
  - PMCID1SR.
  - PMVIDSR.
  - PMCID2SR.
  - PMCFGR.
  - PMIIDR.
  - PMDEVAFF0.
  - PMDEVAFF1.
  - PMLAR.
  - PMLSR.
  - PMAUTHSTATUS.
  - PMDEVAFFARCH.
  - PMDEVTYPE.
  - PMPIDR0.
  - PMPIDR1.
  - PMPIDR2.
  - PMPIDR3.
  - PMPIDR4.
  - PMCIDR0.
  - PMCIDR1.
  - PMCIDR2.
  - PMCIDR3.

Performance Monitors external register descriptions on page I5-10753 describes these registers.

- The following controls do not affect the external views:
  - PMSELR.
  - PMUSERENR.
  - HDCR.{TPM, TPMCR, HPMN}.

Instead, see the register descriptions in Chapter I5 External System Control Register Descriptions.

- The PMSWINC_EL0 register is OPTIONAL in the external views.

External views of the Performance Monitors registers when the 64-bit external PMU programmers' model extension is implemented

When the 64-bit external PMU programmers' model extension is implemented, the following registers are accessible only in external views:

- PMDEVAFF, provided as a concatenation of PMDEVAFF0 and PMDEVAFF1.
- If FEAT_PCSRv8p2 is implemented:
  - PMCCIDSR, provided as a concatenation of PMCID1SR and PMCID2SR.
  - PMVCCIDSR, provided as a concatenation of PMCID1SR and PMVIDSR.
- The following registers, which provide direct read/write access to the event counter control and status bits, and access the same registers as the corresponding SET and CLR pairs in the System register interface:
  - PMCNTEN.
Recommended External Interface to the Performance Monitors

I3.1 About the external interface to the Performance Monitors registers

---

— PMINTEN.
— PMOVS.

--- Note ---
— Writing 1 to a bit in one of these registers causes the corresponding SET and CLR register values to be 1.
— Writing 0 to a bit in one of these registers causes the corresponding SET and CLR register values to be 0.
— Bits [63:32] of these registers are RES0.

PMSWINC_EL0, otherwise OPTIONAL in the external views, is not accessible through the memory-mapped interface.

Performance Monitors external register descriptions on page I5-10753 describes these registers.

I3.1.3 Synchronization of changes to the memory-mapped views

Synchronization must comply with Synchronization of memory-mapped registers on page I1-10718.

In particular, if a Performance Monitor is visible in both System register and an external view, and is accessed simultaneously through these two mechanisms, the behavior must be as if the accesses occurred atomically and in any order. For more information, see Synchronization of changes to the external debug registers on page H8-10358.

I3.1.4 Access permissions for external views of the Performance Monitors

For more information, see External debug interface register access permissions on page H8-10364.

The following tables show the access permissions for the Performance Monitors registers in a Debug implementation for Armv8 or later architectures:

- Table I3-1 on page I3-10737 when the 64-bit external PMU programmers' model extension is implemented.
- Table I3-2 on page I3-10738 when the 64-bit external PMU programmers' model extension is not implemented.

These tables use the following terms:

**DLK**
When FEAT_DoubleLock is implemented and locked, DoubleLockStatus() == TRUE, accesses to some registers produce an error. Applies to both interfaces.

**EPMAD**
When AllowExternalPMUAccess() == FALSE, external debug access is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure access to the register. See also Behavior of a not permitted memory-mapped access on page H8-10363.

**Error**
Indicates that the access gives an error response.

**Default**
This shows the default access permissions, if none of the conditions in this list prevent access to the register.

**Off**
The Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed, and EDPRSR.PU will read as zero.

--- Note ---
If debug power is off, then all external debug interface accesses return an error.

**OSLK**
When the OS Lock is locked, OSLAR_EL1.OSLK == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.

**SLK**
This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the optional Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-10362.
For all other accesses, this column is ignored.

--- Note ---

When the 64-bit external PMU programmers’ model extension is implemented, the Software Lock is not implemented.

 Indicates that the control has no effect on the behavior of the access:
• If no other control affects the behavior, the Default access behavior applies.
• However, another control might determine the behavior.

- Implemented event counters only. \( n \) is the counter number.
- Implemented only if FEAT_PCSRv8p2 is implemented. See Chapter H7 The PC Sample-based Profiling Extension.
- Only if the OPTIONAL PMSWINC_EL0 register is implemented in the external debug interface.
- See IMPLEMENTATION DEFINED registers on page H8-10366.
I3.1 About the external interface to the Performance Monitors registers
Chapter I4
Recommended External Interface to the Activity Monitors

This chapter describes the optional external interface to the Activity Monitors Extension registers. It contains the following section:

- About the external interface to the Activity Monitors Extension registers on page I4-10742

Note

Activity Monitors external register descriptions on page I5-10838 describes the external view of the Activity Monitors Extension registers.
I4.1  About the external interface to the Activity Monitors Extension registers

If an implementation supports the Activity Monitors Extension, it may optionally support an external memory-mapped interface to the Activity Monitors Extension, and, if so, may further optionally support CoreSight device registers and ID registers.

The memory access sizes supported by the external interface to the Activity Monitors registers:

- Comply with the requirements of Supported access sizes on page I1-10716.
- Include word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if all components with direct memory access to the AMU support making 64-bit accesses.

The base address of the memory-mapped view is aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. The address offsets for the memory-mapped view are given in Table I5-3 on page I5-10836.

I4.1.1  Differences in the external views of the Activity Monitors Extension registers

The external memory-mapped interface view of the Activity Monitors Extension registers accesses the same registers as the System registers interface to the registers, except that:

- The following are accessible only in the System registers interface:
  - AMUSERENR_EL0
  - AMEVCTVOFF0<el>: EL2
  - AMEVCTVOFF1<el>: EL2
  - AMCG1IDR_EL0

- If implemented, the following registers are accessible only in the memory-mapped view:
  - AMIIDR
  - AMDEVAFF0
  - AMDEVAFF1
  - AMDEVARCH
  - AMDEVTYPER
  - AMPIDR0
  - AMPIDR1
  - AMPIDR2
  - AMPIDR3
  - AMPIDR4
  - AMCIDR0
  - AMCIDR1
  - AMCIDR2
  - AMCIDR3

Activity Monitors external register descriptions on page I5-10838 describes these registers.

- If FEAT_AMUv1p1 virtualization of the activity monitors is enabled, the memory-mapped view of the registers presents the physical view of the counter without any offset. Virtualization of the Activity Monitors does not affect the memory-mapped view of the registers.

Note: The memory mapped view of the activity monitors is unaffected by AMCR_EL0.CG1RZ and AMCR.CG1RZ.
I4.1.2 Access during reset and power transitions

As described in Power and reset domains on page D12-5431, the power and reset domains of the activity monitoring unit are named the AMU domain and AMU reset, and when reset of the AMU power domain occurs, the activity monitoring unit is reset and the counters are reset to zero.

If the AMU domain is an always-on power domain, while the PE is reset or powered down counter values may be preserved and might be accessible by memory-mapped access.

If the AMU domain is the Core power domain, while the PE is reset or powered down and when a memory-mapped access occurs, the access reads as zero and the bus access completes without an error.
Chapter I5
External System Control Register Descriptions

This chapter describes the external system control registers. It excludes the External debug registers that are described in Chapter H9 External Debug Register Descriptions. It contains the following sections:

- About the external system control register descriptions on page I5-10746.
- External Performance Monitors registers summary on page I5-10748.
- Performance Monitors external register descriptions on page I5-10753.
- External Activity Monitors Extension registers summary on page I5-10836.
- Activity Monitors external register descriptions on page I5-10838.
- Generic Timer memory-mapped registers overview on page I5-10874.
- Generic Timer memory-mapped register descriptions on page I5-10875.
- RAS register descriptions on page I5-10919.
I5.1 About the external system control register descriptions

This chapter describes the external system control registers other than the external debug registers. That is, it describes:

An external view of the Performance Monitors registers

Arm recommends that implementations provide access to the Performance Monitors registers through the OPTIONAL External debug interface, and provide the OPTIONAL memory-mapped interface to this interface:

* External Performance Monitors registers summary on page I5-10748 lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
* Performance Monitors external register descriptions on page I5-10753 describes each of the memory-mapped registers.

Chapter I3 Recommended External Interface to the Performance Monitors describes the recommended interface to these registers.

Note

Chapter D11 The Performance Monitors Extension describes the Performance Monitors. The following sections describe the System register interfaces to the Performance Monitors:

* Performance Monitors registers on page D17-6740, for accesses from an Exception level that is using AArch64.
* Performance Monitors registers on page G8-9963, for accesses from an Exception level that is using AArch32.

An external view of the Activity Monitors Extension registers

An implementation which supports the Activity Monitors Extension may support an optional external memory-mapped interface to the Activity Monitors Extension registers.

* External Activity Monitors Extension registers summary on page I5-10836 lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
* Activity Monitors external register descriptions on page I5-10838 describes each of the memory-mapped registers.

Chapter I3 Recommended External Interface to the Performance Monitors describes the recommended interface to these registers.

Note

Chapter D12 The Activity Monitors Extension describes the Activity Monitors. The following sections describe the System register interfaces to the Activity Monitors:

* Activity Monitors registers on page D17-6816, for accesses from an Exception level that is using AArch64.
* Activity Monitors registers on page G8-10047, for accesses from an Exception level that is using AArch32.

The registers for the system level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system level component described in Chapter I2 System Level Implementation of the Generic Timer. In this chapter:

* Generic Timer memory-mapped registers overview on page I5-10874 gives an overview of the registers, referring to Chapter I2 for more information.
* Generic Timer memory-mapped register descriptions on page I5-10875 describes each of the memory-mapped registers.
Chapter D10 The Generic Timer in AArch64 state describes the Generic Timer component that is accessible using the System registers. The following sections describe the System register interfaces to that component:

- *Generic Timer registers on page D17-7014*, for accesses from an Exception level that is using AArch64.
- *Generic Timer registers on page G8-10144*, for accesses from an Exception level that is using AArch32.

Chapter H9 External Debug Register Descriptions describes the external debug registers.
## 5.2 External Performance Monitors registers summary

When an implementation provides access to the Performance Monitors registers through the External debug interface, that interface provides access to:

- Performance Monitors System registers.
- A read-only configuration register, PMCFGR.
- The optional CoreSight registers for the Performance Monitors, if they are implemented.

The locations of the registers are defined as offsets from a system-defined base address. *Performance Monitors external register views* defines this memory map.

### 5.2.1 Performance Monitors external register views

The following tables show the external view of the Performance Monitors registers:

- Table I5-1 on page I5-10748 when the 64-bit external PMU programmers' model extension is implemented.
- Table I5-2 on page I5-10750 when the 64-bit external PMU programmers' model extension is not implemented.

All other entries are reserved.

**Note**

- Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any external view.
- The registers that relate to an implemented event counter, PMNx, are PMEVCNTR<n> and PMEVTYPER<n>.
- Tables in this section only list the Armv8 registers. For encoding information of the registers introduced by Armv9, see the individual register descriptions in this chapter.

Each entry in the Name column links to the register description in *Performance Monitors external register descriptions* on page I5-10753.

a. PC Sample-based Profiling Extension registers. Implemented only when FEAT_PCSRv8p2 is implemented, except that from Armv8.2 PMDEVIDt is required regardless of whether FEAT_PCSRv8p2 is implemented. Before Armv8.2, the PC Sample-based Profiling Extension can, instead, be implemented in the memory-mapped debug registers space, see Chapter H7 The PC Sample-based Profiling Extension.

b. CoreSight interface registers, see Management registers and CoreSight compliance on page K6-11688.

c. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.

b. PC Sample-based Profiling Extension registers. Implemented only when FEAT_PCSRv8p2 is implemented, except that from Armv8.2 PMDEVID is required regardless of whether FEAT_PCSRv8p2 is implemented.

Before Armv8.2, the PC Sample-based Profiling Extension can, instead, be implemented in the memory-mapped debug registers space, see Chapter H7 The PC Sample-based Profiling Extension.

c. CoreSight interface registers, see Management registers and CoreSight compliance on page K6-11688.
d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.
I5.3 Performance Monitors external register descriptions

This section describes the external view of the Performance Monitors registers. *External Performance Monitors registers summary* on page I5-10748 lists these registers in offset order.
I5.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

**Attributes**

PMAUTHSTATUS is a 32-bit register.

**Field descriptions**

</tbody>
</table>

RES0 31 28 27 26 25 24 23 16 15 14 13 12 11 8 7 6 5 4 3 2 1 0
RTNID RES0 RLID RES0 SNID SID NSNID
RLNID RES0
RLID RES0
SNID RES0
SID RES0
NSNID
All other values are reserved.

**NSID, bits [3:2]**

Holds the same value as `DBGAUTHSTATUS_EL1.NSID`.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values of this field are:

- 0b00 Not implemented.
- All other values are reserved.

**Accessing the PMAUTHSTATUS:**

PMAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB8</td>
<td>PMAUTHSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### 5.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configurations**

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally **UNKNOWN** values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.</td>

</tr>
<tr>
<td>NSK</td>
<td>29</td>
<td>Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.</td>
</tr>
</tbody>
</table>

*When EL3 is implemented:*
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.

**Otherwise:**
Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*
Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.
Otherwise, cycles in Non-secure EL0 are not counted.

**Otherwise:**
Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*
EL2 (Hypervisor) filtering bit. Controls counting in EL2.
If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.
If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

0b0  Do not count cycles in EL2.
0b1  Count cycles in EL2.

**Otherwise:**
Reserved, RES0.

**M, bit [26]**

*When EL3 is implemented:*
Secure EL3 filtering bit.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.
Otherwise, cycles in Secure EL3 are not counted.
Most applications can ignore this field and set its value to 0.

--- **Note** ---
This field is not visible in the AArch32 PMCCFILTR System register.

**Otherwise:**
Reserved, RES0.

**Bit [25]**
Reserved, RES0.

**SH, bit [24]**

*When FEAT_SEL2 is implemented and EL3 is implemented:*
Secure EL2 filtering.
If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.
Otherwise, cycles in Secure EL2 are not counted.
Note
This field is not visible in the AArch32 PMCCFILTR System register.

Otherwise:
Reserved, RES0.

Bit [23]
Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:
Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.
Otherwise, cycles in Realm EL1 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:
Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.
Otherwise, cycles in Realm EL0 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:
Realm EL2 filtering bit. Controls counting in Realm EL2.
If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.
Otherwise, cycles in Realm EL2 are not counted.
The reset behavior of this field is:
• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [19:0]
Reserved, RES0.
Accessing the PMCCFILTR_EL0:

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x47C</td>
<td>PMCCFILTR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see *Time as measured by the Performance Monitors cycle counter on page D11-5246*. PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configurations**

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

PMCCNTR_EL0 is in the Core power domain.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR_EL0:**

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0F8</td>
<td>PMCCNTR_EL0</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMCCNTR_EL0[31:0] are RO.
• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMCCNTR_EL0[31:0] are RW.

• Otherwise accesses to PMCCNTR_EL0[31:0] generate an error response.

PMCCNTR_EL0[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0FC</td>
<td>PMCCNTR_EL0</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMCCNTR_EL0[63:32] are RO.

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMCCNTR_EL0[63:32] are RW.

• Otherwise accesses to PMCCNTR_EL0[63:32] generate an error response.
I5.3.4 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see *The PMU event number space and common events* on page D11-5275.

Note

This view of the register was previously called PMCEID0_EL0.

Configurations

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

0b0 The Common event is not implemented, or not counted.

0b1 The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID0:

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE20</td>
<td>PMCEID0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.5 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

For more information about the Common events and the use of the PMCEIDn registers, see *The PMU event number space and common events* on page D11-5275.

--- Note ---

This view of the register was previously called PMCEID1_EL0.

--- Configurations ---

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

PMCEID1 is in the Core power domain.

--- Attributes ---

PMCEID1 is a 32-bit register.

--- Field descriptions ---

`ID<n>`, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x020 + n).

For each bit:

- 0b0 The Common event is not implemented, or not counted.
- 0b1 The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- Note ---

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<\text{n}> registers of that earlier version of the PMU architecture.

### Accessing the PMCEID1:

--- Note ---
AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE24</td>
<td>PMCEID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.6 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEIDn registers, see The PMU event number space and common events on page D11-5275.

Configurations

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

External register PMCEID2 bits [31:0] are architecturally mapped to AArch32 System register PMCEID2[31:0].

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (0x4000 + n).

For each bit:

0b0 The Common event is not implemented, or not counted.

0b1 The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.
Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<e<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID2:

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE28</td>
<td>PMCEID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.7 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

**Purpose**

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEIDn registers, see *The PMU event number space and common events* on page D11-5275.

**Configurations**

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

External register PMCEID3 bits [31:0] are architecturally mapped to AArch32 System register PMCEID3[31:0].

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

**Attributes**

PMCEID3 is a 32-bit register.

**Field descriptions**

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

- **0b0** The Common event is not implemented, or not counted.
- **0b1** The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

--- Note ---

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.
Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID3:

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE2C</td>
<td>PMCEID3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

**Purpose**

Contains PMU-specific configuration data.

**Configurations**

PMCFGR is in the Core power domain.

**Attributes**

PMCFGR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCG, bits [31:28]</td>
<td>This feature is not supported, so this field is RAZ. Reads as 0000. Access to this field is RO.</td>
</tr>
<tr>
<td>FZO, bit [21]</td>
<td>Freeze-on-overflow supported. Defined values are: 0b0 Freeze-on-overflow mechanism is not supported. PMCR_EL0.FZO is RES0. 0b1 Freeze-on-overflow mechanism is supported. PMCR_EL0.FZO is RW. FEAT_PMUv3p7 implements the functionality added by the value 0b1. From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.</td>
</tr>
<tr>
<td>UEN, bit [19]</td>
<td>User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ. Reads as 000. Access to this field is RO.</td>
</tr>
<tr>
<td>WT, bit [18]</td>
<td>This feature is not supported, so this bit is RAZ. Reads as 000. Access to this field is RO.</td>
</tr>
<tr>
<td>NA, bit [17]</td>
<td>This feature is not supported, so this bit is RAZ.</td>
</tr>
</tbody>
</table>
Reads as 0b0.
Access to this field is RO.

**EX, bit [16]**

Export supported. Value is IMPLEMENTATION DEFINED.

0b0  PMCR_EL0.X is RES0.
0b1  PMCR_EL0.X is read/write.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**CCD, bit [15]**

Cycle counter has prescale.
This is RES1 if AArch32 is supported, and RAZ otherwise.

0b0  PMCR_EL0.D is RES0.
0b1  PMCR_EL0.D is read/write.

**CC, bit [14]**

Dedicated cycle counter (counter 31) supported.
Reads as 0b1.
Access to this field is RO.

**SIZE, bits [13:8]**

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.
From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.
This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.
Reads as 0b111111.
Access to this field is RO.

**N, bits [7:0]**

Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.
0x00  Only PMCCNTR_EL0 implemented.
0x01..0x1F  PMCCNTR_EL0 plus this number of event counters are implemented.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

### Accessing the PMCFGR:

#### Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE00</td>
<td>PMCFGR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme on page K6-11699.*

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRMBL_0</td>
<td>[7:0]</td>
<td>Preamble</td>
<td>0x0D</td>
</tr>
</tbody>
</table>

Accessing the PMCIDR0:

PMCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF0</td>
<td>PMCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.10  PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component. For more information, see About the Component Identification scheme on page K6-11699.

Configurations

Implementation of this register is OPTIONAL. If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain. This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td>CLASS</td>
<td>0b1001</td>
</tr>
<tr>
<td>3-0</td>
<td>PRMBL_1</td>
<td>0b0000</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

0b1001  CoreSight component.

Other values are defined by the CoreSight Architecture. This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000. Access to this field is RO.

Accessing the PMCIDR1:

PMCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF4</td>
<td>PMCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.11 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRMBL_2, bits [7:0]</td>
<td>Preamble. Reads as 0x05. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the PMCIDR2:**

PMCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFF8</td>
<td>PMCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.12 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR3 is a 32-bit register.

**Field descriptions**

```
  31  8  7  6  5  4  3  2  1  0
   |   |   |   |   |   |   |   |
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td><strong>PRMBL_3</strong></td>
<td>Preamble</td>
</tr>
<tr>
<td></td>
<td>Reads as 0xB1</td>
</tr>
<tr>
<td></td>
<td>Access to this field is RO</td>
</tr>
</tbody>
</table>

**Accessing the PMCIDR3:**

PMCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFF</td>
<td>PMCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.13 PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

**Purpose**
Contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

**Configurations**
PMCID1SR is in the Core power domain.
This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

_____ Note _____
Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

**Attributes**
PMCID1SR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>ContextIDR_EL1, bits [31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:</td>
</tr>
<tr>
<td>- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.</td>
</tr>
<tr>
<td>- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.</td>
</tr>
<tr>
<td>- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and PMCID1SR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.</td>
</tr>
</tbody>
</table>

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is constrained unpredictable whether PMCID1SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCID1SR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-10354.

PMCID1SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x288</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

PMCID1SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x228</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.14 PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

Configurations

PMCID2SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

——— Note ————

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXTIDR_EL2</td>
<td></td>
</tr>
</tbody>
</table>

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCID2SR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-10354.

PMCID2SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x22C</td>
<td>PMCID2SR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.15 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<\(n\)>_EL0. Reading this register shows which counters are enabled.

**Configurations**

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

PMCNTENCLR_EL0 is in the Core power domain.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>C, bit [31]</th>
<th>PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle</td>
</tr>
<tr>
<td></td>
<td>counter.</td>
</tr>
<tr>
<td></td>
<td>The reset behavior of this field is:</td>
</tr>
<tr>
<td></td>
<td>• On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>P&lt;(n)&gt;_bit [(n)], for (n = 30) to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter disable bit for PMEVCNTR&lt;(n)&gt;_EL0.</td>
</tr>
<tr>
<td>IF PMCFG.]N is less than 31, bits [30:PMCFG.]N] are RAZ/WI.</td>
</tr>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
Accessing the PMCNTENCLR_EL0:

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC20</td>
<td>PMCNTENCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
### 5.3.16 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>_EL0. Reading this register shows which counters are enabled.

**Configurations**

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

PMCNTENSET_EL0 is in the Core power domain.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

**Field descriptions**

C, bit [31]

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

- \(0b0\) When read, means the cycle counter is disabled. When written, has no effect.
- \(0b1\) When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- \(0b0\) When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
- \(0b1\) When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**Accessing the PMCNTENSET_EL0:**

--- **Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC00</td>
<td>PMCNTENSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.17 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configurations**

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register PMCR[7:0].

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register PMCR_EL0[7:0].

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

**Attributes**

PMCR_EL0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 31:11</td>
<td>Reserved, RAZ/WI. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.</td>
</tr>
<tr>
<td>Bit 10</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| FZO, bit 9 | Freeze-on-overflow. Stop event counters on overflow. When FEAT_PMUv3p7 is implemented: Freeze-on-overflow. Stop event counters on overflow. In the description of this field:  
  - If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.  
  - If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.  
  - If EL2 is not implemented, PMN is PMCR_EL0.N.  
  - 0b0 Do not freeze on overflow.  
  - 0b1 Event counter PMEVCNTR<n>_EL0 does not count when PMOVSCCLR_EL0[(PMN-1):0] is nonzero and n is in the range of affected event counters. If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters and PMCCNTR_EL0. The operation of this field applies even when EL2 is disabled in the current Security state. |
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [8]**

Reserved, RES0.

**LP, bit [7]**

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[63:0].</td>
</tr>
</tbody>
</table>

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)]. The field does not affect the operation of other event counters and PMCCNTR_EL0. The operation of this field applies even when EL2 is disabled in the current Security state. The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**LC, bit [6]**

When AArch32 is supported:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].</td>
</tr>
</tbody>
</table>

Arm deprecates use of PMCR_EL0.LC = 0. The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**DP, bit [5]**

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.</td>
</tr>
</tbody>
</table>
0b1  Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen:
    • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2.
    • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3.
    • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled.
    • If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state.
If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited or frozen.
For more information, see Prohibiting event and cycle counting on page D11-5256.
The reset behavior of this field is:
    • On a Warm reset:
      — When the implementation only supports execution in AArch32 state, this field resets to 0.
      — Otherwise, this field resets to an architecturally UNKNOWN value.
    Otherwise:
      Reserved, RES0.

X, bit [4]
When the implementation includes a PMU event export bus:
Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.
0b0  Do not export events.
0b1  Export events where not prohibited.
This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.
No events are exported when counting is prohibited.
This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.
The reset behavior of this field is:
    • When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:
      — A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
      — 0 if the reset is into an Exception level that is using AArch32.
    Otherwise:
      Reserved, RAZ/WI.

D, bit [3]
When AArch32 is supported:
Clock divider.
0b0  When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1  When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.
If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.
Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:
  - A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
  - 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RES0.

**C, bit [2]**

Cycle counter reset. The effects of writing to this bit are:

0b0  No action.
0b1  Reset PMCCNTR_EL0 to zero.

--- Note ---

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

---

Access to this field is WO/RAZ.

**P, bit [1]**

Event counter reset. The effects of writing to this bit are:

0b0  No action.
0b1  Reset all event counters, not including PMCCNTR_EL0, to zero.

--- Note ---

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of MDCR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

---

Access to this field is WO/RAZ.

**E, bit [0]**

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

0b0  PMCCNTR_EL0 is disabled and event counters PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are disabled.
0b1  PMCCNTR_EL0 and event counters PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are enabled by PMCNTENSET_EL0.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.
Accessing the PMCR_EL0:

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE04</td>
<td>PMCR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.18 PMDEVAF0, Performance Monitors Device Affinity register 0

The PMDEVAF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain. This register is required if the external interface to the PMU is implemented.

**Attributes**

PMDEVAF0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1lo</td>
<td>MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.</td>
</tr>
</tbody>
</table>

**Accessing the PMDEVAF0:**

PMDEVAF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFA8</td>
<td>PMDEVAF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.19 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

**Attributes**

PMDEVAFF1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1hi</td>
<td>0xFAC</td>
</tr>
</tbody>
</table>

**MPIDR_EL1hi, bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the PMDEVAFF1:**

PMDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFAC</td>
<td>PMDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.20 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**
Identifies the programmers’ model architecture of the Performance Monitor component.

**Configurations**
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**
PMDEVARCH is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>31:21</td>
<td>Defines the architecture of the component. For Performance Monitors, this is Arm Limited. Bits [31:28] are the JEP106 continuation code, 0x4. Bits [27:21] are the JEP106 ID code, 0x3B. Reads as 0b01000111011. Access to this field is RO.</td>
</tr>
<tr>
<td>PRESENT</td>
<td>20</td>

01000111011 31 21
1 1 0 1 1 1 0 0 0 0 0 0 1 0 11 0 0
ARCHITECT  PRESENT  REVISION  ARCHVER

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

0b0010 Performance Monitors Extension version 3, PMUv3.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12]. Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

0xA16 Armv8-A PE performance monitors.
0xA26  From Armv8.8:
Armv8-A PE performance monitors, including the 64-bit programmers' model extension.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0]. This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing the PMDEVARCH:

PMDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFBC</td>
<td>PMDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### 5.3.21 PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

**Purpose**

Provides information about features of the Performance Monitors implementation.

**Configurations**

- If `FEAT_DoPD` is implemented, this register is in the Core power domain.
- If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes `FEAT_PCSRv8p2`. Otherwise, its location is RES0.

---

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of `EDDEVID.PCSample`.

---

**Attributes**

PMDEVID is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-4</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>4-0</td>
<td>PCSample</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

- **0b0000**: PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
- **0b0001**: PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

`FEAT_PCSRv8p2` implements the functionality identified by the value `0b0001`.

**Accessing the PMDEVID:**

PMDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFC8</td>
<td>PMDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.22 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs performance monitor interface.

Configurations

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Mask</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td></td>
<td>Reserved, RES0</td>
<td>00000000</td>
</tr>
<tr>
<td>7-4</td>
<td></td>
<td>Subtype. Indicates this is a component within a PE.</td>
<td>0010</td>
</tr>
<tr>
<td>3-0</td>
<td></td>
<td>Major type. Indicates this is a performance monitor component.</td>
<td>0110</td>
</tr>
</tbody>
</table>

Accessing the PMDEVTYPE:

PMDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFCC</td>
<td>PMDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.23 PMEVCNTR<\(n\rangle\_EL0, Performance Monitors Event Count Registers, \(n = 0 - 30\)

The PMEVCNTR<\(n\rangle\_EL0 characteristics are:

**Purpose**

Holds event counter \(n\), which counts events, where \(n\) is 0 to 30.

**Configurations**

External register PMEVCNTR<\(n\rangle\_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<\(n\rangle\_EL0[31:0].

External register PMEVCNTR<\(n\rangle\_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<\(n\rangle\_EL0[31:0].

PMEVCNTR<\(n\rangle\_EL0 is in the Core power domain.

**Attributes**

PMEVCNTR<\(n\rangle\_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

**Field descriptions**

*When FEAT_PMUv3p5 is implemented:*

<table>
<thead>
<tr>
<th>Bit range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:0]</td>
<td>Event counter (n)</td>
</tr>
<tr>
<td>[31:0]</td>
<td>Event counter (n)</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Event counter \(n\). Value of event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR.LP and HDCR.HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<\(n\rangle\_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bit range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:0]</td>
<td>Event counter (n)</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter \(n\). Value of event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 30.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVCNTR\<n>_EL0:**

External accesses to the performance monitors ignore the following controls:

  • PMUSERENR_EL0.
  • If implemented, MDCR_EL2:{TPM, TPMCR, HPMN}.
  • MDCR_EL3.TPM.

This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMUv3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8\times n have a CONSTRAINED UNPREDICTABLE behavior.

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR\<n>_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x000 + (8 * n)</td>
<td>PMEVCNTR&lt;n&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

  • When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
  • When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
  • Otherwise accesses to this register generate an error response.
I5.3.24 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configurations**

External register PMEVTYPER<n>_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[63:0].

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

**Attributes**

PMEVTYPER<n>_EL0 is a 64-bit register.

**Field descriptions**

TC, bits [63:61]

*When FEAT_PMUv3_TH is implemented:*

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by PMEVTYPER<n>_EL0.evtCount would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and this PMEVTYPER<n>_EL0.TH as unsigned integer values.

- **0b000** Not-equal. The counter increments by V on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH. If PMEVTYPER<n>_EL0.TH is zero, the threshold function is disabled.
- **0b001** Not-equal, count. The counter increments by 1 on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH.
- **0b010** Equals. The counter increments by V on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH.
- **0b011** Equals, count. The counter increments by 1 on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH.
- **0b100** Greater-than-or-equal. The counter increments by V on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more.
- **0b101** Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more.
0b110 Less-than. The counter increments by 1 on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH.

0b111 Less-than, count. The counter increments by 1 on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH.

The reset behavior of this field is:
- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [60:44]
Reserved, RES0.

TH, bits [43:32]

When FEAT_PMUv3_TH is implemented:
Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.TC is 0b000 and PMEVTYPER<n>_EL0.TH is zero, then the threshold function is disabled.

If PMMIR.THWIDTH is less than 12, then bits PMEVTYPER<n>_EL0.TH[11:PMMIR.THWIDTH] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to 2^{PMMIR.THWIDTH}.

The reset behavior of this field is:
- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

P, bit [31]
Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

0b0 Count events in EL1.

0b1 Do not count events in EL1.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]
User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

0b0 Count events in EL0.

0b1 Do not count events in EL0.
The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<\(n\)>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<\(n\)>_EL0.RLH bit.

0b0  Do not count events in EL2.
0b1  Count events in EL2.

The reset behavior of this field is:
  • On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**M, bit [26]**

*When EL3 is implemented:*

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.
Note
This field is not visible in the AArch32 PMEVTYPER<n> System register.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

MT, bit [25]
When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:
Multithreading.
0b0 Count events only on controlling PE.
0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

Note
- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SH, bit [24]
When FEAT_SEL2 is implemented and EL3 is implemented:
Secure EL2 filtering.
If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.
Otherwise, events in Secure EL2 are not counted.

Note
This field is not visible in the AArch32 PMEVTYPER<n> System register.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

T, bit [23]
When FEAT_TME is implemented:
Transactional state filtering bit. Controls counting in Transactional state.
0b0 This bit has no effect on the filtering of events.
0b1 Do not count events in Transactional state.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
    Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:
    Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.
    If the value of this bit is equal to the value of the PMEVTYPER<\text{n}>_EL0.P bit, events in Realm
    EL1 are counted.
    Otherwise, events in Realm EL1 are not counted.
    The reset behavior of this field is:
    • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
    Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:
    Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.
    If the value of this bit is equal to the value of the PMEVTYPER<\text{n}>_EL0.U bit, events in Realm
    EL0 are counted.
    Otherwise, events in Realm EL0 are not counted.
    The reset behavior of this field is:
    • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
    Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:
    Realm EL2 filtering bit. Controls counting in Realm EL2.
    If the value of this bit is not equal to the value of the PMEVTYPER<\text{n}>_EL0.NSH bit, events in Realm
    EL2 are counted.
    Otherwise, events in Realm EL2 are not counted.
    The reset behavior of this field is:
    • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
    Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:
    Extension to evtCount[9:0]. For more information, see evtCount[9:0].
    The reset behavior of this field is:
    • On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
    Reserved, RES0.
**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<\text{n}>_EL0.

Software must program this field with an event that is supported by the PE being programmed. The ranges of event numbers allocated to each type of event are shown in Table D11-7 on page D11-5275.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<\text{n}>_EL0(evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<\text{n}>_EL0(evtCount field is the value written to the field.

--- Note ---

Arm recommends this behavior for all implementations of FEAT_PMUv3.

---

Otherwise, if PMEVTYPER<\text{n}>_EL0(evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<\text{n}>_EL0(evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<\text{n}>_EL0(evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the PMEVTYPER<\text{n}>_EL0(evtCount field is UNKNOWN.

--- Note ---

UNPREDICTABLE means the event must not expose privileged information.

---

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVTYPER<\text{n}>_EL0:**

If FEAT_PMUv3_TH or FEAT_PMUv3p8 is implemented, bits [63:32] of this interface are accessible at offset 0xA00 + (4*n). Otherwise accesses at this offset are IMPLEMENTATION DEFINED.

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

PMEVTYPER<\text{n}>_EL0[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x400 + (4 * n)</td>
<td>PMEVTYPER&lt;\text{n}&gt;_EL0</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMEVTYPER<\text{n}>_EL0[31:0] are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMEVTYPER<\text{n}>_EL0[31:0] are RW.
- Otherwise accesses to PMEVTYPER<\text{n}>_EL0[31:0] generate an error response.
PMEVTYPER<n>_EL0[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xA00 + (4 * n)</td>
<td>PMEVTYPER&lt;n&gt;_EL0</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMEVTYPER<n>_EL0[63:32] are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMEVTYPER<n>_EL0[63:32] are RW.
- Otherwise accesses to PMEVTYPER<n>_EL0[63:32] generate an error response.
PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**
Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<\(\leq n\)> EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**
External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].
External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].
PMINTENCLR_EL1 is in the Core power domain.

**Attributes**
PMINTENCLR_EL1 is a 32-bit register.

**Field descriptions**

C, bit [31]
PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<\(\leq n\)>, bit [n], for \(n = 30\) to \(0\)
Event counter overflow interrupt request disable bit for PMEVCNTR<\(\leq n\)> EL0.
If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

0b0 When read, means that the PMEVCNTR<\(\leq n\)> EL0 event counter interrupt request is disabled. When written, has no effect.

0b1 When read, means that the PMEVCNTR<\(\leq n\)> EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<\(\leq n\)> EL0 interrupt request.

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMINTENCLR_EL1:

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC60</td>
<td>PMINTENCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.26  PMI宁SENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMI宁SENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNT_R_EL0, and the event counters PMEVCNT_R<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**

External register PMI宁SENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMI宁SENSET_EL1[31:0].

External register PMI宁SENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMI宁SENSET[31:0].

PMI宁SENSET_EL1 is in the Core power domain.

**Attributes**

PMI宁SENSET_EL1 is a 32-bit register.

**Field descriptions**

C, bit [31]
PMCCNT_R_EL0 overflow interrupt request enable bit. Possible values are:

**0b0**  When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

**0b1**  When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for PMEVCNT_R<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

**0b0**  When read, means that the PMEVCNT_R<n>_EL0 event counter interrupt request is disabled. When written, has no effect.

**0b1**  When read, means that the PMEVCNT_R<n>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNT_R<n>_EL0 interrupt request.

The reset behavior of this field is:

•  On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**Accessing the PMINTENSET_EL1:**

--- **Note** ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC40</td>
<td>PMINTENSET_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
### I5.3.27 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configurations**

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

PMITCTRL is a 32-bit register.

**Field descriptions**

![Field descriptions diagram]

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

- **0b0** Normal operation.
- **0b1** Integration mode enabled.

The reset behavior of this field is:

- The following resets apply:
  - If the register is implemented in the Core power domain:
    - On a Cold reset, this field resets to 0.
    - On an External debug reset, the value of this field is unchanged.
    - On a Warm reset, the value of this field is unchanged.
  - If the register is implemented in the External debug power domain:
    - On a Cold reset, the value of this field is unchanged.
    - On an External debug reset, this field resets to 0.
    - On a Warm reset, the value of this field is unchanged.

**Accessing the PMITCTRL:**

PMITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
<td>PMITCTRL</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
### I5.3.28 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

**Purpose**

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLAR is a 32-bit register.

**Field descriptions**

*When Software Lock is implemented:*

```
+---+---+
|   |   |
| #1 | #0 |
+---+---+
  KEY

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

**Otherwise:**

```
+---+---+
|   |   |
| #1 | #0 |
+---+---+
  RES0

Otherwise

Bits [31:0]

Reserved, RES0.

**Accessing the PMLAR:**

PMLAR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB0</td>
<td>PMLAR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
I5.3.29 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

**Purpose**

 Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

- If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.
- If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:3]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>nTT, bit [2]</td>
<td>Not thirty-two bit access required. Reads as 0b0. Access to this field is RO.</td>
</tr>
<tr>
<td>SLK, bit [1]</td>
<td><strong>When Software Lock is implemented and FEAT_DoPD is not implemented:</strong> Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0. For memory-mapped accesses when Software Lock is implemented, possible values of this field are: 0b0 Lock clear. Writes are permitted to this component's registers. 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects. The reset behavior of this field is: • On an External debug reset, this field resets to 1. <strong>Otherwise:</strong> Reserved, RAZ.</td>
</tr>
</tbody>
</table>
SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the PMLSR:

PMLSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB4</td>
<td>PMLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.30 **PMMIR, Performance Monitors Machine Identification Register**

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation.

**Configurations**

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31–24</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>23–20</td>
<td>THWIDTH</td>
<td></td>
</tr>
<tr>
<td>19–16</td>
<td>BUS_SLOTS</td>
<td></td>
</tr>
<tr>
<td>15–8</td>
<td>SLOTS</td>
<td></td>
</tr>
<tr>
<td>7–0</td>
<td>BUS_WIDTH</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**THWIDTH, bits [23:20]**

Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<\text{n}>_EL0.TH field.

- 0b0000: FEAT_PMUv3_TH is not implemented.
- 0b0001: 1 bit. PMEVTYPER<\text{n}>_EL0.TH[11:1] are RES0.
- 0b0010: 2 bits. PMEVTYPER<\text{n}>_EL0.TH[11:2] are RES0.
- 0b0011: 3 bits. PMEVTYPER<\text{n}>_EL0.TH[11:3] are RES0.
- 0b0100: 4 bits. PMEVTYPER<\text{n}>_EL0.TH[11:4] are RES0.
- 0b0101: 5 bits. PMEVTYPER<\text{n}>_EL0.TH[11:5] are RES0.
- 0b0110: 6 bits. PMEVTYPER<\text{n}>_EL0.TH[11:6] are RES0.
- 0b0111: 7 bits. PMEVTYPER<\text{n}>_EL0.TH[11:7] are RES0.
- 0b1000: 8 bits. PMEVTYPER<\text{n}>_EL0.TH[11:8] are RES0.
- 0b1001: 9 bits. PMEVTYPER<\text{n}>_EL0.TH[11:9] are RES0.
- 0b1010: 10 bits. PMEVTYPER<\text{n}>_EL0.TH[11:10] are RES0.
- 0b1011: 11 bits. PMEVTYPER<\text{n}>_EL0.TH[11] is RES0.
- 0b1100: 12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<\text{n}>_EL0.TH is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log2(number of bytes), plus one.

- 0b0000  The information is not available.
- 0b0011  Four bytes.
- 0b0100  8 bytes.
- 0b0101  16 bytes.
- 0b0110  32 bytes.
- 0b0111  64 bytes.
- 0b1000  128 bytes.
- 0b1001  256 bytes.
- 0b1010  512 bytes.
- 0b1011  1024 bytes.
- 0b1100  2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the PMMIR:

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE40</td>
<td>PMMIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
• Otherwise accesses to this register are RO.
I5.3.31 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR\(<n>_EL0. Writing to this register clears these bits.

**Configurations**

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

PMOVSCLR_EL0 is in the Core power domain.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

**Field descriptions**

</table>

**C, bit [31]**

Cycle counter overflow clear bit.

- **0b0** When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
- **0b1** When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

**PMCR_EL0.LC** controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow clear bit for PMEVCNTR\(<n>_EL0.

- **If PMCFGR.N is less than 31**, bits [30:PMCFGR.N] are RAZ/WI.
- **0b0** When read, means that PMEVCNTR\(<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
- **0b1** When read, means that PMEVCNTR\(<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR\(<n>_EL0 overflow bit to 0.**
If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSCLR_EL0:**

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC80</td>
<td>PMOVSCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.32 **PMOVSET_EL0, Performance Monitors Overflow Flag Status Set register**

The PMOVSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<\(n\)>_EL0.

**Configurations**

External register PMOVSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSET_EL0[31:0].

External register PMOVSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSET[31:0].

PMOVSET_EL0 is in the Core power domain.

**Attributes**

PMOVSET_EL0 is a 32-bit register.

**Field descriptions**

|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

**C, bit [31]**

Cycle counter overflow set bit.

- **0b0** When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

- **0b1** When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<\(n\)>, bit [n], for n = 30 to 0**

Event counter overflow set bit for PMEVCNTR<\(n\)>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- **0b0** When read, means that PMEVCNTR<\(n\)>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.

- **0b1** When read, means that PMEVCNTR<\(n\)>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<\(n\)>_EL0 overflow bit to 1.
If FEAT_PMUV3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSSET_EL0:**

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSSET_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCC0</td>
<td>PMOVSSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
### 5.3.33 PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configurations**

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

---

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

**Attributes**

PMPCSR is a 64-bit register.

**Field descriptions**

PMPCSR is a 64-bit register.

#### NS, bit [63]

*When FEAT_RME is implemented:*

Together with the NSE field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

<table>
<thead>
<tr>
<th>NSE</th>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Root.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Realm.</td>
</tr>
</tbody>
</table>

*Otherwise:*

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

0b0 Sample is from Secure state.
Sample is from Non-secure state.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]
Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

- 0b00  Sample is from EL0.
- 0b01  Sample is from EL1.
- 0b10  Sample is from EL2.
- 0b11  Sample is from EL3.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

T, bit [60]
When FEAT_TME is implemented:
Transactional state of the sample. Indicates the Transactional state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

- 0b0  Sample is from Non-transactional state.
- 0b1  Sample is from Transactional state.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

NSE, bit [59]
When FEAT_RME is implemented:
Together with the NS field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.
For a description of the values derived by evaluating NS and NSE together, see PMPCSR.NS.

Otherwise:
Reserved, RES0.

Bits [58:56]
Reserved, RES0.

PCSample[55:32], bits [55:32]
Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]
Bits[31:0] of the sampled instruction address value.
PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:
• The PE is in Debug state.
• PC Sample-based profiling is prohibited.
If a branch instruction has retired since the PE left reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.
PMPCSR[31:0] reads as an unknown value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns \(0xFFFFFFFF\) or an unknown value, the read has the side-effect of setting PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR to unknown values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the optional Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally unknown value.

### Accessing the PMPCSR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register unknown, see "Permitted behavior that might make the PC Sample-based profiling registers unknown" on page H7-10354.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x200</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[31:0] are RO.
- Otherwise accesses to PMPCSR[31:0] generate an error response.

PMPCSR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x220</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[31:0] are RO.
- Otherwise accesses to PMPCSR[31:0] generate an error response.
PMPCSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x204</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[63:32] are RO.
- Otherwise accesses to PMPCSR[63:32] generate an error response.

PMPCSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x224</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[63:32] are RO.
- Otherwise accesses to PMPCSR[63:32] generate an error response.
I5.3.34 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Peripheral identification scheme on page K6-11696.*

**Configurations**

Implementation of this register is OPTIONAL.

If `FEAT_DoPD` is implemented, this register is in the Core power domain. If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit位</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>PART_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the PMPIDR0:**

PMPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE0</td>
<td>PMPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.35  PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.
For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is *OPTIONAL*.
If *FEAT_DoPD* is implemented, this register is in the Core power domain. If *FEAT_DoPD* is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

**Attributes**

PMPIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[7:4]</td>
<td>DES_0</td>
</tr>
<tr>
<td>[3:0]</td>
<td>PART_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.
This field has an **IMPLEMENTATION DEFINED** value.
Access to this field is RO.

**PART_1, bits [3:0]**

Part number, most significant nibble.
This field has an **IMPLEMENTATION DEFINED** value.
Access to this field is RO.

**Accessing the PMPIDR1:**

PMPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE4</td>
<td>PMPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When *FEAT_DoPD* is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.36  **PMPIDR2, Performance Monitors Peripheral Identification Register 2**

The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

If `FEAT_DoPD` is implemented, this register is in the Core power domain. If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR2 is a 32-bit register.

**Field descriptions**

```
+---------+---------+
| 31      | 8       |
| [31:8]  | RES0    |
| 7       | 4       |
| [7:4]   | REVISION|
| 3       | 2       |
| [3:2]   | DES_1   |
| 1       | JEDC    |
```

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**JEDEC, bit [3]**

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is RO.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b11.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the PMPIDR2:**

PMPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE8</td>
<td>PMPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
### 15.3.37 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component. For more information, see *About the Peripheral identification scheme on page K6-11696.*

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>REVAND, bits [7:4]</td>
<td>Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
<tr>
<td>CMOD, bits [3:0]</td>
<td>Customer modified. Indicates someone other than the Designer has modified the component. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the PMPIDR3:**

PMPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFEC</td>
<td>PMPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.38 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

**Purpose**
Provides information to identify a Performance Monitor component.
For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**
Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

**Attributes**
PMPIDR4 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td>SIZE, bits [7:4]</td>
<td>0b0000</td>
</tr>
<tr>
<td>3-0</td>
<td>DES_2, bits [3:0]</td>
<td>0b0100</td>
</tr>
</tbody>
</table>

**Bits [31:8]**
Reserved, RES0.

**SIZE, bits [7:4]**
Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.
Reads as 0b0000.
Access to this field is RO.

**DES_2, bits [3:0]**
Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Accessing the PMPIDR4:**

PMPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFD0</td>
<td>PMPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.39 **PMSWINC_EL0, Performance Monitors Software Increment register**

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW_INCR.

**Configurations**

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

**Field descriptions**

Bit [31]

Reserved, RES0.

**P<n>, bit [n], for n = 30 to 0**

Event counter software increment bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are WI.

0b0 No action. The write to this bit is ignored.

0b1 It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

**Accessing the PMSWINC_EL0:**

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMSWINC_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCA0</td>
<td>PMSWINC_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
I5.3.40 PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

**Purpose**
Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

**Configurations**
PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

--- Note ---
Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

---

**Attributes**
PMVIDSR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-8</td>
<td>VMID[15:8]</td>
</tr>
<tr>
<td>7-0</td>
<td>VMID</td>
</tr>
</tbody>
</table>

**Bits [31:16]**
Reserved, RES0.

**VMID[15:8], bits [15:8]**

*When FEAT_VMID16 is implemented:*

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**VMID, bits [7:0]**

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
  - The PE is executing at EL2.
  - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.

- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.
Because the value written to PMVIDSR is an indirect read of the VMID value, it is CONSTRAINED
UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:
• An instruction that writes to the VMID value.
• The next Context synchronization event.
• Any instruction executed between these two instructions.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMVIDSR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see
Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-10354.

PMVIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x20C</td>
<td>PMVIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
## 5.4 External Activity Monitors Extension registers summary

The memory-mapped interface to the Activity Monitors Extension registers provides read-only access to:
- Read-only copies of the Activity Monitors Extension System registers, with the exception of AMUSERENR.
- An implementation identification register, AMIIDR.
- If they are implemented, the OPTIONAL Activity Monitors CoreSight and ID registers.

The locations of the registers are defined as offsets from a base address. The base address of the memory-mapped view must be aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. Activity Monitors external register views defines this memory map.

### 5.4.1 Activity Monitors external register views

Table I5-3 on page I5-10836 shows the external view of the Activity Monitors registers. All implemented registers are RO. Offsets within the 4KB region not defined in this table are RAZ/WI.

Each entry in the Name column links to the register description in Activity Monitors external register descriptions on page I5-10838, and:
- If the System register? on page I5-10836 column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
  - Activity Monitors registers on page D17-6816, for the AArch64 System register.
  - Activity Monitors registers on page G8-10047, for the AArch32 System register.
- Otherwise, the register is accessible only using the external memory-mapped interface.

I5.5 Activity Monitors external register descriptions

This section lists the external Activity Monitors registers.
I5.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.
Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

**Configurations**

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].
External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].
The power domain of AMCFGR is IMPLEMENTATION DEFINED.
This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCG</td>
<td>Defines the number of counter groups. The number of implemented counter groups is [AMCFGR.NCG + 1]. If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
<tr>
<td>Bits [27:25]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>HDBG, bit [24]</td>
<td>Halt-on-debug supported. This feature must be supported, and so this bit is 0b1. 0b0 AMCR.HDBG is RES0. 0b1 AMCR.HDBG is read/write. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
<tr>
<td>Bits [23:14]</td>
<td>Reserved, RAZ.</td>
</tr>
</tbody>
</table>
SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

Note
Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.
Access to this field is RO.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing the AMCFGR:

AMCFGR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE0</td>
<td>AMCFGR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configurations**

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register `AMCGCR_EL0[31:0]`.

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register `AMCGCR[31:0]`.

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>15-8</td>
<td>CG1NC, Counter Group 1 Number of Counters</td>
<td>00000100</td>
</tr>
<tr>
<td>7-0</td>
<td>CG0NC, Counter Group 0 Number of Counters</td>
<td>00000010</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is RO.

**Accessing the AMCGCR:**

AMCGCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xCE0</td>
<td>AMCGCR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.3 AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see About the Component Identification scheme on page K6-11699.

Configurations

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>PRMBL_0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing the AMCIDR0:

AMCIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF0</td>
<td>AMCIDR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
5.5.4 AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Component Identification scheme* on page K6-11699.

**Configurations**

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Component Offset Instance</th>
<th>0xFF4</th>
<th>AMCIDR1</th>
</tr>
</thead>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

0b1001  CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Preamble.

Reads as 0b0000.

Access to this field is RO.

**Accessing the AMCIDR1:**

AMCIDR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF4</td>
<td>AMCIDR1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.5   AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Component Identification scheme on page K6-11699*.

**Configurations**

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[7:0]</td>
<td>PRMBL_2, bits [7:0]</td>
</tr>
<tr>
<td></td>
<td>Preamble</td>
</tr>
<tr>
<td></td>
<td>Reads as 0x05</td>
</tr>
<tr>
<td></td>
<td>Access to this field is RO</td>
</tr>
</tbody>
</table>

**Accessing the AMCIDR2:**

AMCIDR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF8</td>
<td>AMCIDR2</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.6  AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Component Identification scheme on page* K6-11699.

**Configurations**

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR3 is a 32-bit register.

**Field descriptions**

| Bits [31:8] | Reserved, RES0 |
| Bit 7 | PRMBL_3, bits [7:0] |

Preamble.

Reads as 0xB1.

Access to this field is RO.

**Accessing the AMCIDR3:**

AMCIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFFC</td>
<td>AMCIDR3</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.5.7 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

**Configurations**

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-4</td>
<td>Reserved, RAZ/WI.</td>
</tr>
<tr>
<td>3-0</td>
<td>P&lt;n&gt;, bit [n], for n = 3 to 0</td>
</tr>
</tbody>
</table>

**P<n>, bit [n], for n = 3 to 0**

Activity monitor event counter disable bit for AMEVCNTR0<n>.

**Note**

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- **0b0** When read, means that AMEVCNTR0<n> is disabled.
- **0b1** When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.
Accessing the AMCNTENCLR0:

AMCNTENCLR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC20</td>
<td>AMCNTENCLR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.8 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

**Purpose**

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configurations**

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

The power domain of AMCNTENCLR1 is **IMPLEMENTATION DEFINED**.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-0</td>
<td>P&lt;n&gt;, bit [n], for n = 15 to 0</td>
</tr>
<tr>
<td></td>
<td>Activity monitor event counter disable bit for AMEVCNTR1&lt;n&gt;.</td>
</tr>
<tr>
<td></td>
<td>When N is less than 16, bits [15:N] are RAZ, where N is the value in AMCGCR.CG1NC.</td>
</tr>
<tr>
<td></td>
<td>Possible values of each bit are:</td>
</tr>
<tr>
<td></td>
<td>0b0 When read, means that AMEVCNTR1&lt;n&gt; is disabled.</td>
</tr>
<tr>
<td></td>
<td>0b1 When read, means that AMEVCNTR1&lt;n&gt; is enabled.</td>
</tr>
<tr>
<td></td>
<td>The reset behavior of this field is:</td>
</tr>
<tr>
<td></td>
<td>• On an AMU reset, this field resets to 0.</td>
</tr>
</tbody>
</table>

**Accessing the AMCNTENCLR1:**

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ. Software must treat reserved accesses as RES0. See *Access requirements for reserved and unallocated registers* on page I1-10720.

--- **Note** ---

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.
AMCNTENCLR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC24</td>
<td>AMCNTENCLR1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.9 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

**Purpose**

Enable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

**Configurations**

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

**Attributes**

AMCNTENSET0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>RAZ/WI</th>
<th>P3</th>
<th>P2</th>
<th>P1</th>
<th>P0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**Bits [15:4]**

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

**P<n>, bit [n], for n = 3 to 0**

Activity monitor event counter enable bit for AMEVCNTR0<n>.

**Note**

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

| 0b0  | When read, means that AMEVCNTR0<n> is disabled. |
| 0b1  | When read, means that AMEVCNTR0<n> is enabled. |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.
Accessing the AMCNTENSET0:

AMCNTENSET0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC00</td>
<td>AMCNTENSET0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<\text{n}>.

**Configurations**

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0 (Reserved)</td>
</tr>
<tr>
<td>15-16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>P15</td>
</tr>
<tr>
<td>7</td>
<td>P14</td>
</tr>
<tr>
<td>6</td>
<td>P13</td>
</tr>
<tr>
<td>5</td>
<td>P12</td>
</tr>
<tr>
<td>4</td>
<td>P11</td>
</tr>
<tr>
<td>3</td>
<td>P10</td>
</tr>
<tr>
<td>2</td>
<td>P9</td>
</tr>
<tr>
<td>1</td>
<td>P8</td>
</tr>
<tr>
<td>0</td>
<td>P7</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**P<\text{n}>, bit [\text{n}], for \text{n} = 15 to 0**

Activity monitor event counter enable bit for AMEVCNTR1<\text{n}>.

When \( N \) is less than 16, bits [15:16] are RAZ, where \( N \) is the value in AMCGCR.GC1NC.

Possible values of each bit are:

0b0  When read, means that AMEVCNTR1<\text{n}> is disabled.

0b1  When read, means that AMEVCNTR1<\text{n}> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

**Accessing the AMCNTENSET1:**

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-10720.

_____ **Note** _____

The number of auxiliary activity monitor counters implemented is zero exactly when AMCFGR.NCG == 0b0000.
AMCNTENSET1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC04</td>
<td>AMCNTENSET1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
5.5.11 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

**Purpose**
Global control register for the activity monitors implementation. AMCR is applicable to both the
architected and the auxiliary counter groups.

**Configurations**

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register
AMCR_EL0[31:0].

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register
AMCR[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to
AMCR are RES0.

**Attributes**

AMCR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-11</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>10</td>
<td>HDBG, bit [10]</td>
</tr>
<tr>
<td>9-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:11]**

Reserved, RES0.

**HDBG, bit [10]**

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

- **0b0**: Activity monitors do not halt counting when the PE is halted in Debug state.
- **0b1**: Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [9:0]**

Reserved, RES0.

**Accessing the AMCR:**

AMCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE04</td>
<td>AMCR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.12 AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configurations**

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED. Implementation of this register is OPTIONAL. This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVAFF0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1lo</td>
<td>Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.</td>
</tr>
</tbody>
</table>

**Accessing the AMDEVAFF0:**

AMDEVAFF0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFA8</td>
<td>AMDEVAFF0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.13 AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configurations**

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED. Implementation of this register is OPTIONAL. This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVAFF1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1hi</td>
</tr>
</tbody>
</table>

**MPIDR_EL1hi, bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the AMDEVAFF1:**

AMDEVAFF1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFAC</td>
<td>AMDEVAFF1</td>
</tr>

</table>

Accesses to this interface are RO.
I5.5.14 AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

**Purpose**

Identifies the programmers’ model architecture of the AMU component.

**Configurations**

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVARCH is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>[31:21]</td>
<td>Defines the architecture of the component. For AMU, this is Arm Limited.</td>
</tr>
<tr>
<td>PRESENT</td>
<td>[20]</td>
<td>Indicates that the DEVARCH is present. Reads as 0.</td>
</tr>
<tr>
<td>REVISION</td>
<td>[19:16]</td>
<td>Defines the architecture revision. For architectures defined by Arm this is the minor revision. 0x0000 Architecture revision is AMUv1. All other values are reserved. Access to this field is RO.</td>
</tr>
<tr>
<td>ARCHID</td>
<td>[15:0]</td>
<td>Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided. For AMU:</td>
</tr>
</tbody>
</table>

- Bits [15:12] are the architecture version, 0x0.
- Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1. Reads as 0xA66. Access to this field is RO.
Accessing the AMDEVARCH:

AMDEVARCH can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFBC</td>
<td>AMDEVARCH</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.15 AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE’s performance monitor interface.

**Configurations**

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVTYPE is a 32-bit register.

**Field descriptions**

| Bits [31:8] | Reserved, RES0. |
| 0b0001 | Component within a PE. |
| Access to this field is RO. |

| 0b0110 | Performance monitor component |
| Access to this field is RO. |

**Accessing the AMDEVTYPE:**

AMDEVTYPE can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFCC</td>
<td>AMDEVTYPE</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### AMEVCNTR0\(<n>\), Activity Monitors Event Counter Registers 0, \(n = 0 - 3\)

The AMEVCNTR0\(<n>\) characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configurations**

External register AMEVCNTR0\(<n>\) bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0\(<n>\)_EL0[63:0].

External register AMEVCNTR0\(<n>\) bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0\(<n>\).[63:0].

The power domain of AMEVCNTR0\(<n>\) is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0\(<n>\) are RES0.

**Attributes**

AMEVCNTR0\(<n>\) is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Offset in AArch64</th>
<th>Offset in AArch32</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACNT, bits [63:0]</td>
<td>0x000 + (8 * (n))</td>
<td>0x000 + (8 * (n))</td>
</tr>
</tbody>
</table>

**ACNT, bits [63:0]**

Architected activity monitor event counter \(n\).

Value of architected activity monitor event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 3.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

**Accessing the AMEVCNTR0\(<n>\):**

If \(<n>\) is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0\(<n>\) are RAZ. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-10720.

**Note**

AMECGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVCNTR0\(<n>\)[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x000 + (8 * (n))</td>
<td>AMEVCNTR0(&lt;n&gt;)</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
AMEVCNTR0<\n>[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x004 + (8 * n)</td>
<td>AMEVCNTR0&lt;\n&gt;</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.5.17 AMEVCNTR1<\(n\)>, Activity Monitors Event Counter Registers 1, \(n = 0 - 15\)

The AMEVCNTR1<\(n\)> characteristics are:

**Purpose**

Provides access to the auxiliary activity monitor event counters.

**Configurations**

External register AMEVCNTR1<\(n\)> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<\(n\>EL0[63:0].

External register AMEVCNTR1<\(n\)> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR1<\(n\>[63:0].

The power domain of AMEVCNTR1<\(n\)> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<\(n\)> are RES0.

**Attributes**

AMEVCNTR1<\(n\)> is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Offset</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>ACNT</td>
</tr>
<tr>
<td>31-0</td>
<td>ACNT</td>
</tr>
</tbody>
</table>

**ACNT, bits [63:0]**

Auxiliary activity monitor event counter \(n\).

Value of auxiliary activity monitor event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 15.

The reset behavior of this field is:
- On an AMU reset, this field resets to 0.

**Accessing the AMEVCNTR1<\(n\>):**

If \(<n\> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<\(n\)> are RAZ. Software must treat reserved accesses as RES0. See *Access requirements for reserved and unallocated registers* on page I1-10720.

---

**Note**

AMECGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<\(n\>][31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x100 + (8 * (n))</td>
<td>AMEVCNTR1&lt;(n&gt;)</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
AMEVCNTR1<n>[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x104 + (8 * n)</td>
<td>AMEVCNTR1&lt;n&gt;</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### 5.5.18  AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

**Configurations**

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].

The power domain of AMEVTYPER0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

**Attributes**

AMEVTYPER0<n> is a 32-bit register.

**Field descriptions**

![Field Descriptions Diagram](image)

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>Event Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0011</td>
<td>Processor frequency cycles</td>
</tr>
<tr>
<td>0x4004</td>
<td>Constant frequency cycles</td>
</tr>
<tr>
<td>0x0008</td>
<td>Instructions retired</td>
</tr>
<tr>
<td>0x4005</td>
<td>Memory stall cycles</td>
</tr>
</tbody>
</table>

**Accessing the AMEVTYPER0<n>:**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ. Software must treat reserved accesses as RES0. See *Access requirements for reserved and unallocated registers* on page I1-10720.

**Note**

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.
AMEVTYPER0<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x400 + (4 * n)</td>
<td>AMEVTYPER0&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.19 AMEVTYPER1\langle n \rangle, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1\langle n \rangle characteristics are:

**Purpose**

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1\langle n \rangle counts.

**Configurations**

External register AMEVTYPER1\langle n \rangle bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER1\langle n \rangle\_EL0[31:0].

External register AMEVTYPER1\langle n \rangle bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER1\langle n \rangle[31:0].

The power domain of AMEVTYPER1\langle n \rangle is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1\langle n \rangle are RES0.

**Attributes**

AMEVTYPER1\langle n \rangle is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15</td>
<td>0</td>
<td>evtCount</td>
</tr>
</tbody>
</table>

**Accessing the AMEVTYPER1\langle n \rangle:**

If \langle n \rangle is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1\langle n \rangle are RAZ. Software must treat reserved accesses as RES0. See *Access requirements for reserved and unallocated registers* on page I1-10720.

**Note**

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVTYPER1\langle n \rangle can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x480+(4*\langle n \rangle)</td>
<td>AMEVTYPER1\langle n \rangle</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.5.20 AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

**Purpose**

Defines the implementer and revisions of the AMU.

**Configurations**

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

**Attributes**

AMIIDR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProductID</td>
<td>bits [31:20]</td>
</tr>
<tr>
<td>Variant</td>
<td>bits [19:16]</td>
</tr>
<tr>
<td>Revision</td>
<td>bits [15:12]</td>
</tr>
<tr>
<td>Implementer</td>
<td>bits [11:0]</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

This field is an AMU part identifier.

- If AMPIDR0 is implemented, AMPIDR0.PART_0 matches bits [27:20] of this field.
- If AMPIDR1 is implemented, AMPIDR1.PART_1 matches bits [31:28] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Variant, bits [19:16]**

This field distinguishes product variants or major revisions of the product.

- If AMPIDR2 is implemented, AMPIDR2.REVISION matches AMIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Revision, bits [15:12]**

This field distinguishes minor revisions of the product.

- If AMPIDR3 is implemented, AMPIDR3.REVAND matches AMIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.

- Bit 7 is RES0
- Bits [6:0] contain the JEP106 identity code of the implementer.

- If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.
- If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.
- If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

**Accessing the AMIIDR:**

AMIIDR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE08</td>
<td>AMIIDR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.21 AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Peripheral identification scheme on page K6-11696.

**Configurations**

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>PART_0, Part number, least significant byte. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the AMPIDR0:**

AMPIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE0</td>
<td>AMPIDR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.22 AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Peripheral identification scheme on page K6-11696.

**Configurations**

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code.

For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**PART_1, bits [3:0]**

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the AMPIDR1:**

AMPIDR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE4</td>
<td>AMPIDR1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### 5.5.23 AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[7:4]</td>
<td>REVISION, Part major revision. Parts can also use this field to extend Part number to 16-bits. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
<tr>
<td>[3]</td>
<td>JEDEC, indicates a JEP106 identity code is used. Reads as 0b1. Access to this field is RO.</td>
</tr>
<tr>
<td>[2:0]</td>
<td>DES_1, Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the AMPIDR2:**

AMPIDR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE8</td>
<td>AMPIDR2</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.5.24 AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
<th>Value</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>

</tr>
</tbody>
</table>

**Accessing the AMPIDR3:**

AMPIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE</td>
<td>AMPIDR3</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.5.25  **AMPIDR4, Activity Monitors Peripheral Identification Register 4**

The AMPIDR4 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR4 is a 32-bit register.

**Field descriptions**

![Field Descriptions](image)

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. \( \log_2 \) of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

**DES_2, bits [3:0]**

Designer. JEP106 continuation code, least significant nibble.

For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the AMPIDR4:**

AMPIDR4 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xF00</td>
<td>AMPIDR4</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
5.6 **Generic Timer memory-mapped registers overview**

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBase\(N\) register frames, each with its own base address CNTBase\(N\).
- For each CNTBase\(N\) register frame, if required, a CNTEL0Base\(N\) register frame, at base address CNTEL0Base\(N\), that provides an EL0 view of the CNTBase\(N\) register frame.

For more information, see:

- **Memory-mapped timer components** on page I2-10728.
- **The CNTBase\(N\) and CNTEL0Base\(N\) frames** on page I2-10729. This section includes the memory map of the CNTBase\(N\) and CNTBase\(N\) register frames.
- **The CNTCTLBase frame** on page I2-10728. This section includes the memory map of the CNTCTLBase register frame.

--- **Note** ---

*Providing a complete set of features in a system level implementation* on page K7-11702 gives an implementation example for a system level implementation of the Generic Timer."
I5.7 Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. *Generic Timer memory-mapped registers overview on page I5-10874* gives an overview of these registers, and includes links to their memory maps.
I5.7.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

**Configurations**

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR<n> is a 32-bit register.

**Field descriptions**

![Register Diagram]

**Bits [31:6]**

Reserved, RES0.

**RWPT, bit [5]**

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>.

- 0b0 No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
- 0b1 Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**RWVT, bit [4]**

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>.

- 0b0 No access to the Virtual Timer registers in frame <n>. The registers are RES0.
- 0b1 Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.
RVOFF, bit [3]

Read-only access to CNTVOFF, in frame \(<n>\).

0b0 No access to CNTVOFF in frame \(<n>\). The register is RES0.

0b1 Read-only access to CNTVOFF in frame \(<n>\).

The reset behavior of this field is:

* On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame \(<n>\).

0b0 No access to CNTFRQ in frame \(<n>\). The register is RES0.

0b1 Read-only access to CNTFRQ in frame \(<n>\).

The reset behavior of this field is:

* On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame \(<n>\).

0b0 No access to CNTVCT in frame \(<n>\). The register is RES0.

0b1 Read-only access to CNTVCT in frame \(<n>\).

The reset behavior of this field is:

* On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame \(<n>\).

0b0 No access to CNTPCT in frame \(<n>\). The register is RES0.

0b1 Read-only access to CNTPCT in frame \(<n>\).

The reset behavior of this field is:

* On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTACR\(<n>\):

In a system that recognizes two Security states:

* CNTACR\(<n>\) is always accessible by Secure accesses.

* CNTNSAR.NS\(<n>\) determines whether CNTACR\(<n>\) is accessible by Non-secure accesses.

CNTACR\(<n>\) can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x040 + (4 * n)</td>
<td>CNTACR(&lt;n&gt;)</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.7.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Configurations**

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

**Attributes**

CNTCR is a 32-bit register.

**Field descriptions**

![Field descriptions diagram]

**Bits [31:18]**

Reserved, RES0.

**FCREQ, bits [17:8]**

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see The Frequency modes table on page I2-10725. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:
- On a Timer reset, this field resets to 0.

**Bits [7:3]**

Reserved, RES0.

**SCEN, bit [2]**

Reserved, RES0.

**When FEAT_CNTSC is implemented:**

Scale Enable.

- **0b0** Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.
- **0b1** Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:
- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.
When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HDBG, bit [1]**

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

- 0b0  System counter ignores Halt-on-debug.
- 0b1  Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**EN, bit [0]**

Enables the counter:

- 0b0  System counter disabled.
- 0b1  System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

**Accessing the CNTCR:**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x000</td>
<td>CNTCR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
### 5.7.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

**Purpose**

Indicates the current count value.

**Configurations**

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTCV is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>CountValue</td>
<td>0x0000</td>
<td>63:0</td>
</tr>
</tbody>
</table>

**CountValue, bits [63:0]**

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTCV:**

<table>
<thead>
<tr>
<th>Frame</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTControlBase</td>
<td>RW</td>
</tr>
<tr>
<td>CNTReadBase</td>
<td>RO</td>
</tr>
</tbody>
</table>

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV[63:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x008</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
CNTCV[63:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x000</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.7.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

**Purpose**  
An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

**Configurations**  
The power domain of CNTEL0ACR is IMPLEMENTATION DEFINED.  
Implementation of this register is OPTIONAL.  
For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**  
CNTEL0ACR is a 32-bit register.

#### Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-10</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
</tbody>
</table>
| 9    | EL0PTEN  | Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.  
0b0 No access. Registers are RES0 in the second view.  
0b1 Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.  
The reset behavior of this field is:  
• On a Timer reset, this field resets to an architecturally UNKNOWN value. |
| 8    | EL0VTEN  | Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.  
0b0 No access. Registers are RES0 in the second view.  
0b1 Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.  
The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.  
The reset behavior of this field is:  
• On a Timer reset, this field resets to an architecturally UNKNOWN value. |
Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for CNTVCT and CNTFRQ.

0b0  CNTVCT is not visible in the second view.
    If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.

0b1  Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

• On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for CNTPCT and CNTFRQ.

0b0  CNTPCT is not visible in the second view.
    If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.

0b1  Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

• On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTEL0ACR:

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

• Whether the CNTBaseN frame has virtual timer capability.
• Whether the corresponding CNTEL0BaseN frame is implemented.
• For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

• The register location in that frame is RAZ/WI.
• If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible in that frame.

CNTEL0ACR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x014</td>
<td>CNTEL0ACR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
### 5.7.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

**Purpose**

Indicates the base frequency of the system counter.

**Configurations**

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see *The Frequency modes table* on page I2-10725.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

**Attributes**

CNTFID0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Frequency, bits [31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>The base frequency of the system counter, in Hz.</td>
</tr>
<tr>
<td>The reset behavior of this field is:</td>
</tr>
<tr>
<td>• On a Timer reset, this field resets to an architecturally <em>UNKNOWN</em> value.</td>
</tr>
</tbody>
</table>

**Accessing the CNTFID0:**

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020</td>
<td>CNTFID0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO or RW.
5.7.6 CNTFID\(<n>\), Counter Frequency IDs, \(n > 0, n = 1 - 1003\)

The CNTFID\(<n>\) characteristics are:

**Purpose**
Indicates alternative system counter update frequencies.

**Configurations**
The power domain of CNTFID\(<n>\) is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see *The Frequency modes table* on page I2-10725.

The number of CNTFID\(<n>\) registers is IMPLEMENTATION DEFINED, and the only required CNTFID\(<n>\) register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

**Attributes**
CNTFID\(<n>\) is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td></td>
</tr>
</tbody>
</table>

**Frequency, bits [31:0]**
A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[ \text{increment} = \frac{\text{base frequency}}{\text{selected frequency}} \]

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTFID\(<n>\):**
It is IMPLEMENTATION DEFINED whether this register is RO or RW.
In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNCTControlBase</td>
<td>0x020 + (4 * n)</td>
<td>CNTFID&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO or RW.
I5.7.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLB frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configurations**

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clock frequency</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ:**

CNTFRQ must be implemented as an RW register in the CNTCTLB frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLB frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTB frame, and in the corresponding CNTEL0B frame.

*CNTCTLB status and control fields for the CNTB and CNTEL0B frames* on page I2-10731 describes the status fields that identify whether a CNTB frame is implemented, and for an implemented frame:

- Whether the CNTB frame has virtual timer capability.
- Whether the corresponding CNTEL0B frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTB frame, and any corresponding CNTEL0B frame, is accessible by Non-secure accesses.

For an implemented CNTB frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0B frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTB frame.
  - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
• Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x010</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.

CNTFRQ can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x010</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.

CNTFRQ can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x000</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
## 15.7.8 CNTID, Counter Identification Register

The CNTID characteristics are:

**Purpose**

Indicates whether counter scaling is implemented.

**Configurations**

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

**Attributes**

CNTID is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-4</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>3-0</td>
<td>CNTSC</td>
</tr>
</tbody>
</table>

**CNTSC, bits [3:0]**

Indicates whether Counter Scaling is implemented

- 0b0000: Counter scaling is not implemented.
- 0b0001: Counter scaling is implemented.

All other values are reserved.

**Accessing the CNTID:**

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x1C</td>
<td>CNTID</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.7.9 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configurations

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

| Bits [31:8] | Reserved, RES0. |
| NS<n>, bit [n], for n = 7 to 0 | Non-secure access to frame n. |
| 0b0 | Secure access only. Behaves as RES0 to Non-secure accesses. |
| 0b1 | Secure and Non-secure accesses permitted. |

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:
- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTNSAR:

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x004</td>
<td>CNTNSAR</td>
</tr>
</tbody>
</table>
Accesses to this interface are RW.
I5.7.10    CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

**Purpose**
Control register for the EL1 physical timer.

**Configurations**
The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.
For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**
CNTP_CTL is a 32-bit register.

**Field descriptions**

![Diagram of CNTP_CTL register]

**Bits [31:3]**
Reserved, RES0.

**ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is met:
0b0 Timer condition is not met.
0b1 Timer condition is met.
When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met.
ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.
When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.
The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

**IMASK, bit [1]**
Timer interrupt mask bit. Permitted values are:
0b0 Timer interrupt is not masked by the IMASK bit.
0b1 Timer interrupt is masked by the IMASK bit.
For more information, see the description of the ISTATUS bit.
The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**
Enables the timer. Permitted values are:
0b0 Timer disabled.
0b1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TV AL continues to count down.
--- Note ---
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:
• On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CTL:
CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

_CNTCTRLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames_ on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

• Whether the CNTBaseN frame has virtual timer capability.
• Whether the corresponding CNTEL0BaseN frame is implemented.
• For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:
• CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
• Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:
• CNTP_CTL is accessible in that frame if both:
  — CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  — The value of CNTEL0ACR.EL0PTEN is 1.
• Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTP_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.7.11 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the EL1 physical timer.

**Configurations**

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL:**

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.
For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x020</td>
<td>CNTP_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTP_CVAL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x020</td>

## I5.7.12 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

### Purpose
Holds the timer value for the EL1 physical timer.

### Configurations
The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.
For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

### Attributes
CNTP_TVAL is a 32-bit register.

### Field descriptions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:0]</td>
<td>TimerValue</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.
On a read of this register:
- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.
When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:
- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.
When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.
The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

### Accessing the CNTP_TVAL:

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

CNTCTBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame:

- CNTP_TV AL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TV AL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TV AL is accessible in that frame if both:
  - CNTP_TV AL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TV AL address in that frame is RAZ/WI.

CNTP_TV AL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x028</td>
<td>CNTP_TV AL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTP_TV AL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x028</td>
<td>CNTP_TV AL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.7.13 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configurations**

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Physical count value</th>
</tr>
</thead>
</table>

**Accessing the CNTPCT:**

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

*CNTCTRLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames* on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.
If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT[31:0] can be accessed through its memory-mapped interface:

```
Component  Frame  Offset  Instance  Range
Timer       CNTBaseN  0x000  CNTPCT  31:0
```

Accesses to this interface are RO.

CNTPCT[31:0] can be accessed through its memory-mapped interface:

```
Component  Frame  Offset  Instance  Range
Timer       CNTEL0BaseN  0x000  CNTPCT  31:0
```

Accesses to this interface are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

```
Component  Frame  Offset  Instance  Range
Timer       CNTBaseN  0x004  CNTPCT  63:32
```

Accesses to this interface are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

```
Component  Frame  Offset  Instance  Range
Timer       CNTEL0BaseN  0x004  CNTPCT  63:32
```

Accesses to this interface are RO.
### CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Configurations**

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTSCR is a 32-bit register.

**Field descriptions**

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the average amount added to the counter value for one period of the frequency of the Generic counter as described in the CNTFRQ register.

The actual rate of update of the counter value is determined by the counter update frequency.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTSCR:**

In a system that supports Secure and Non-secure memory maps theCNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x10</td>
<td>CNTSCR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.7.15 CNTSR, Counter Status Register

The CNTSR characteristics are:

**Purpose**

Provides counter frequency status information.

**Configurations**

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTSR is a 32-bit register.

**Field descriptions**

Bits [31:18]

Reserved, RES0.

FCACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see *The Frequency modes table* on page I2-10725.

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

- $0b0$ Counter is not halted.
- $0b1$ Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

**Accessing the CNTSR:**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x004</td>
<td>CNTSR</td>
</tr>
</tbody>
</table>
Accesses to this interface are RO.
I5.7.16  CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

**Configurations**

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTTIDR is a 32-bit register.

**Field descriptions**

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have a second view. The register in the first view of the frame is</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has a second view, CNTEL0Base&lt;n&gt;.</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

<table>
<thead>
<tr>
<th>Bit[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have virtual capability. The virtual time and offset registers are</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has virtual capability. The virtual time and offset registers are implemented</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[1] is RES0.
Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Bit[0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; is not implemented. All registers associated with the frame are.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; is implemented</td>
</tr>
</tbody>
</table>

**Accessing the CNTTIDR:**

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses. CNTTIDR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x08</td>
<td>CNTTIDR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### 5.7.17 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

**Purpose**
Control register for the virtual timer.

**Configurations**
The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.
For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-10723.

**Attributes**
CNTV_CTL is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td></td>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td></td>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
<td>Timer interrupt mask bit. Permitted values are:</td>
</tr>
<tr>
<td></td>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td></td>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE</td>
<td>Enables the timer. Permitted values are:</td>
</tr>
<tr>
<td></td>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td></td>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.
When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.
The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:
- 0b0: Timer interrupt is not masked by the IMASK bit.
- 0b1: Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.
The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:
- 0b0: Timer disabled.
- 0b1: Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TV AL continues to count down.
Note
Disabling the output signal might be a power-saving option.

The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CTL:

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

CNTV_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTV_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.7.18 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

**Configurations**

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CompareValue</td>
<td>[63:0]</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL:**

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

*CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames* on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.
For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.

- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x030</td>
<td>CNTV_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTV_CVAL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x030</td>
<td>CNTV_CVAL</td>

Accesses to this interface are RW.
I5.7.19 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configurations

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL:

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x038</td>
<td>CNTV_TVAL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTV_TVAL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>

Accesses to this interface are RW.
I5.7.20 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value.

**Configurations**

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer on page I2-10723](#).

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual count value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td></td>
</tr>
<tr>
<td>32</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTVCT:**

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

[CntctlBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.
If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x008</td>
<td>CNTVCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.

CNTVCT[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>

Accesses to this interface are RO.
I5.7.21 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

**Configurations**

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

```
63  32  Virtual offset
31  0  Virtual offset
```

**Bits [63:0]**

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF:**

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

CNTCTRLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<\n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

**Note**

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<\n>} register must be accessible as an atomic 64-bit value.
CNTVOFF[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x018</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.

CNTVOFF[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x01C</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### 15.7.22 CNTVOFF<\(n\)>, Counter-timer Virtual Offsets, \(n = 0 - 7\)

The CNTVOFF<\(n\)> characteristics are:

**Purpose**

Holds the 64-bit virtual offset for frame CNTBase<\(n\)>.
This is the offset between real time and virtual time.

**Configurations**

The power domain of CNTVOFF<\(n\)> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-10723.

**Attributes**

CNTVOFF<\(n\)> is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Virtual offset</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Virtual offset</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual offset.

The reset behavior of this field is:

* On a Timer reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF<\(n\)>:**

In the CNTCTLBase frame a CNTVOFF<\(n\)> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability.

For more information, see *CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames* on page I2-10731.

--- **Note** ---

The value of <\(n\)> in an instance of CNTVOFF<\(n\)> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<\(n\)> register in the CNTCTLBase frame:

* CNTVOFF<\(n\)> is always accessible by Secure accesses.
* CNTNSAR.NS<\(n\)> determines whether CNTVOFF<\(n\)> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<\(n\)> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<\(n\)> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<\(n\)> registers must be accessible as atomic 64-bit values.
CNTVOFF<n>[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x0000 + (8 * n)</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.

CNTVOFF<n>[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x0004 + (8 * n)</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
5.7.23 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

**Configurations**

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-10723.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

**Attributes**

CounterID<n> is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

**Accessing the CounterID<n>:**

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-10731 describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
CounterID<\textit{n}> can be accessed through its memory-mapped interface:

I5.8 RAS register descriptions

This section describes the RAS registers.
### I5.8.1 ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR0 is a 32-bit register.

**Field descriptions**

![Field Description Table]

- ** Bits [31:8] **
  - Reserved, RES0.

- **PRMBL_0, bits [7:0]**
  - Component identification preamble, segment 0.
  - Reads as 0x0D.
  - Access to this field is RO.

**Accessing the ERRCIDR0:**

ERRCIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>

Accesses to this interface are RO.
### 5.8.2 ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0.</th>
</tr>

Accesses to this interface are RO.
I5.8.3 ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

**Purpose**

Provides discovery information about the component.
For more information, see *About the Peripheral identification scheme on page K6-11696.*

**Configurations**

Implementation of this register is *OPTIONAL.*
ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR2 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td>PRMBL_2</td>

</tbody>
</table>

Accesses to this interface are RO.
I5.8.4 ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR3 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRMBL_3, bits [7:0]</td>
<td>Component identification preamble, segment 3. Reads as 0xB1. Access to this field is RO.</td>

**Accessing the ERRCIDR3:**

ERRCIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFFC</td>
<td>ERRCIDR3</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### 5.8.5 ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

**Purpose**

Critical Error Interrupt configuration register.

**Configurations**

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCRICR0 is a 64-bit register.

**Field descriptions**

*When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

- **Bits [63:56]**
  
  Reserved, RES0.

- **ADDR, bits [55:2]**
  
  Message Signaled Interrupt address. \((\text{ERRCRICR0.ADDR} \ll 2)\) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.
  
  The physical address size supported by the component is IMPLEMENTATION DEFINED.
  
  Unimplemented high-order physical address bits are RES0.
  
  The reset behavior of this field is:
  
  - On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

- **Bits [1:0]**
  
  Reserved, RES0.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

- **IMPLEMENTATION DEFINED, bits [63:0]**
  
  IMPLEMENTATION DEFINED.
Accessing the ERRCRICR0:

ERRCRICR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA0</td>
<td>ERRCRICR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.6  ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

**Purpose**

Critical Error Interrupt configuration register.

**Configurations**

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0. ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCRICR1 is a 32-bit register.

**Field descriptions**

*When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA</td>
<td>Payload for the message signaled interrupt. The reset behavior of this field is:</td>
</tr>
<tr>
<td></td>
<td>- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

**Accessing the ERRCRICR1:**

ERRCRICR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA8</td>
<td>ERRCRICR1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.7 ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose
Critical Error Interrupt control and configuration register.

Configurations
This register is present only when (the Critical Error Interrupt is implemented or the implementation
does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration
registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.
ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes
ERRCRICR2 is a 32-bit register.

Field descriptions
When the Critical Error Interrupt is implemented and the implementation uses the recommended
layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>IRQEN</td>
<td>MemAttr</td>
<td>NSMSI</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]
Reserved, RES0.

IRQEN, bit [7]
When the component supports disabling message signaled interrupts:
Message signaled interrupt enable. Enables generation of message signaled interrupts.
0b0 Disabled.
0b1 Enabled.
The reset behavior of this field is:
• On an Error recovery reset, this field resets to 0.

Otherwise:
Reserved, RES0.
Message signaled interrupt enable.
Message signaled interrupts are always enabled.

NSMSI, bit [6]
When the component supports configuring the Security attribute for message signaled interrupts and
the component does not allow Non-secure writes to ERRCRICR2:
Security attribute. Defines the physical address space for message signaled interrupts.
0b0 Secure.
0b1 Non-secure.
The reset behavior of this field is:
• On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRCRICR2:
Reserved, RES0.
Security attribute. Defines the physical address space for message signaled interrupts. The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:
Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts. The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

\(SH, \text{ bits } [5:4]\)

\textbf{When the component supports configuring the Shareability domain for message signaled interrupts:}

Shareability. Defines the Shareability domain for message signaled interrupts.

- 0b00 Not shared.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

\(\text{MemAttr, bits } [3:0]\)

\textbf{When the component supports configuring the memory type for message signaled interrupts:}

Memory type. Defines the memory type and attributes for message signaled interrupts.

- 0b0000 Device-nGnRnE memory.
- 0b0001 Device-nGnRE memory.
- 0b0010 Device-nGRE memory.
- 0b0011 Device-GRE memory.
- 0b0101 Normal memory, Inner Non-cacheable, Outer Non-cacheable.
- 0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.
- 0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.
- 0b1001 Normal memory, Inner Non-cacheable, Outer Write-Through.
- 0b1010 Normal memory, Inner Write-Through, Outer Write-Through.
- 0b1011 Normal memory, Inner Write-Back, Outer Write-Through.
- 0b1101 Normal memory, Inner Non-cacheable, Outer Write-Back.
- 0b1110 Normal memory, Inner Write-Through, Outer Write-Back.
- 0b1111 Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

\textbf{Note}

This is the same format as the VMSA\text{v8-64} stage 2 memory region attributes.
The reset behavior of this field is:
- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
- Reserved, RES0.
- Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

**When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

**Accessing the ERRCRICR2:**

ERRCRICR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEAC</td>
<td>ERRCRICR2</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
### I5.8.8 ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

**Purpose**

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.Aff3,Aff2, and these values are equal to ERRDEVAFF.Aff3,Aff2.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.F0V read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

**Configurations**

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVAFF is a 64-bit register.

**Field descriptions**

- **Bits [63:40]**  
  Reserved, RES0.
- **Aff3, bits [39:32]**  
  PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.
- **F0V, bit [31]**  
  Indicates that the ERRDEVAFF.Aff0 field is valid.
  
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.</td>
</tr>
</tbody>
</table>
U, bit [30]

**When ERRDEVAFF.F0V == 1:**

Uniprocessor. The MPIDR_EL1.U field, viewed from the highest Exception level of the associated PE.

**Otherwise:**

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

**When ERRDEVAFF.F0V == 1:**

Multithreaded. The MPIDR_EL1.MT field, viewed from the highest Exception level of the associated PE.

**Otherwise:**

Reserved, UNKNOWN.

Aff2, bits [23:16]

**When affine with a PE or PEs at affinity level 2 or below:**

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

**When affine with a sub-set of PEs at affinity level 2:**

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

0bxxxxxxx1 ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.

0bxxxxxx10 ERRDEVAFF.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.

0bxxxxx100 ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.

0bxxxx1000 ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.

0bxxx10000 ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.

0bxx100000 ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.

0bx1000000 ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.

**Otherwise:**

PE affinity level 2. Indicates whether the PE affinity is at level 3.

0x80 PE affinity is at level 3.

All other values are reserved.

Aff1, bits [15:8]

**When affine with a PE or PEs at affinity level 1 or below:**

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.
**When affine with a sub-set of PEs at affinity level 1:**

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

- 0bxxxxxxx1 ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
- 0bxxxxxx10 ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
- 0bxxxxx100 ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
- 0bxxxx1000 ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
- 0bxxx10000 ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
- 0bxx100000 ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
- 0bx1000000 ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.

**Otherwise:**

PE affinity level 1. Indicates whether the PE affinity is at level 2.

- 0x00 PE affinity is above level 2 or a subset of level 2.
- 0x80 PE affinity is at level 2.

**Aff0, bits [7:0]**

**When affine with a PE at affinity level 0:**

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

**When affine with a sub-set of PEs at affinity level 0:**

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

- 0bxxxxxxx1 ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
- 0bxxxxxx10 ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
- 0bxxxxx100 ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
- 0bxxxx1000 ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
- 0bxxx10000 ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
- 0bxx100000 ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
- 0bx1000000 ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.

**Otherwise:**

PE affinity level 0. Indicates whether the PE affinity is at level 1.

- 0x00 PE affinity is above level 1 or a subset of level 1.
- 0x80 PE affinity is at level 1.
Accessing the ERRDEVAFF:

ERRDEVAFF can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>

<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFA8</td>
<td>ERRDEVAFF</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### 5.8.9 ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

**Configurations**

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVARCH is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>21</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>REVISION</td>
<td>ARCHVER</td>
<td>ARCHPART</td>
<td>PRESENT</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

0b01000111011 JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

**PRESENT, bit [20]**

DEV ARCH Present. Defines that the DEV ARCH register is present.

0 Device Architecture information not present.

1 Device Architecture information present.

This field reads as 1.

**REVISION, bits [19:16]**

Revision. Defines the architecture revision of the component.

0000 RAS System Architecture v1.0.

0001 RAS System Architecture v1.1. As 0000 and also:

- Simplifies ERR<n>-STATUS.
- Adds support for additional ERR<n>MISC<m> registers.
- Adds support for the optional RAS Timestamp Extension.
- Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

**ARCHVER, bits [15:12]**

Architecture Version. Defines the architecture version of the component.

0000 RAS System Architecture v1.

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.
ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

0xA00 RAS System Architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].
This field reads as 0xA00.

**Accessing the ERRDEVARCH:**

ERRDEVARCH can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFBCC</td>
<td>ERRDEVARCH</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
### I5.8.10 ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

**Purpose**

Provides discovery information for the component.

**Configurations**

ERRDEVID is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVID is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:16]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>NUM, bits [15:0]</td>
<td>Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records. This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise. This field has an IMPLEMENTATION DEFINED value. Access to this field is RO.</td>
</tr>
</tbody>
</table>

**Accessing the ERRDEVID:**

ERRDEVID can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFC8</td>
<td>ERRDEVID</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.8.11 ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configurations

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [63:56]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| ADDR, bits [55:2] | Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero. The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0. The reset behavior of this field is:  
  - On an Error recovery reset, this field resets to an architecturally UNKNOWN value. |
| Bits [1:0] | Reserved, RES0. |

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED, bits [63:0]</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>
Accessing the ERRERICR0:

ERRERICR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE90</td>
<td>ERRERICR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.12 ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

**Purpose**

Error Recovery Interrupt configuration register.

**Configurations**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR1 is a 32-bit register.

**Field descriptions**

*When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| DATA, bits [31:0] | Payload for the message signaled interrupt. The reset behavior of this field is:  
  • On an Error recovery reset, this field resets to an architecturally UNKNOWN value. |

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED, bits [31:0]</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

**Accessing the ERRERICR1:**

ERRERICR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE8</td>
<td>ERRERICR1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
### 5.8.13 ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

**Purpose**

Error Recovery Interrupt control and configuration register.

**Configurations**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR2 is a 32-bit register.

**Field descriptions**

*When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7</td>
<td><strong>IRQEN</strong>, bit [7]</td>
</tr>
<tr>
<td>6</td>
<td><strong>NSMSI</strong>, bit [6]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**IRQEN, bit [7]**

*When the component supports disabling message signaled interrupts:*

Message signaled interrupt enable. Enables generation of message signaled interrupts.

- `0b0`: Disabled.
- `0b1`: Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

**NSMSI, bit [6]**

*When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:*

Security attribute. Defines the physical address space for message signaled interrupts.

- `0b0`: Secure.
- `0b1`: Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.
The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.
The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

0b00 Not shared.
0b10 Outer Shareable.
0b11 Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

• Any Device memory type.
• Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

• On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

0b0000 Device-nGnRnE memory.
0b0001 Device-nGnRE memory.
0b0010 Device-nGRE memory.
0b0011 Device-GRE memory.
0b0101 Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001 Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010 Normal memory, Inner Write-Through, Outer Non-cacheable.
0b1011 Normal memory, Inner Write-Back, Outer Write-Through.
0b1101 Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110 Normal memory, Inner Write-Through, Outer Write-Back.
0b1111 Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.
--- Note ---
This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:
- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
Memory type.
The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

**Accessing the ERRERICR2:**

ERRERICR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE9C</td>
<td>ERRERICR2</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW,
I5.8.14 ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

**Purpose**

Fault Handling Interrupt configuration register.

**Configurations**

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRFHICR0 is a 64-bit register.

**Field descriptions**

*When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

![Diagram of ERRFHICR0 with fields and bit allocations]

**Bits [63:56]**

Reserved, RES0.

**ADDR, bits [55:2]**

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED.

Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

![Diagram of IMPLEMENTATION DEFINED with fields and bit allocations]

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.
**Accessing the ERRFHICR0:**

ERRFHICR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE80</td>
<td>ERRFHICR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.15 ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

**Purpose**
Fault Handling Interrupt configuration register.

**Configurations**
This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**
ERRFHICR1 is a 32-bit register.

**Field descriptions**

*When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA</td>
<td></td>
</tr>
</tbody>
</table>

DATA, bits [31:0]
Payload for the message signaled interrupt.
The reset behavior of this field is:
• On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]
IMPLEMENTATION DEFINED.

**Accessing the ERRFHICR1:**
ERRFHICR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE88</td>
<td>ERRFHICR1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.16 ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

**Purpose**
Fault Handling Interrupt control and configuration register.

**Configurations**
This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<\(n\) registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**
ERRFHICR2 is a 32-bit register.

**Field descriptions**
*When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<\(n\) registers:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0.</td>
<td>0</td>
</tr>
<tr>
<td>[7]</td>
<td>IRQEN, bit</td>
<td>0 1</td>
</tr>
</tbody>
</table>

**IRQEN, bit [7]***
*When the component supports disabling message signaled interrupts:*
Message signaled interrupt enable. Enables generation of message signaled interrupts.

0b0 Disabled.

0b1 Enabled.

The reset behavior of this field is:
* On an Error recovery reset, this field resets to 0.

**Otherwise:**
Reserved, RES0.
Message signaled interrupt enable.
Message signaled interrupts are always enabled.

**NSMSI, bit [6]***
*When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRFHICR2:*
Security attribute. Defines the physical address space for message signaled interrupts.

0b0 Secure.

0b1 Non-secure.

The reset behavior of this field is:
* On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
When the component allows Non-secure writes to ERRFHIR2:
Reserved, RES0.
Security attribute. Defines the physical address space for message signaled interrupts.
The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:
Reserved, RES0.
Security attribute. Defines the physical address space for message signaled interrupts.
The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:
Shareability. Defines the Shareability domain for message signaled interrupts.
0b00 Not shared.
0b10 Outer Shareable.
0b11 Inner Shareable.
All other values are reserved.
This field is ignored when ERRFHIR2.MemAttr specifies any of the following memory types:
• Any Device memory type.
• Normal memory, Inner Non-cacheable, Outer Non-cacheable.
All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.
The reset behavior of this field is:
• On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
Shareability.
The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:
Memory type. Defines the memory type and attributes for message signaled interrupts.
0b0000 Device-nGnRnE memory.
0b0001 Device-nGnRE memory.
0b0010 Device-nGRE memory.
0b0011 Device-GRE memory.
0b0101 Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001 Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010 Normal memory, Inner Write-Through, Outer Write-Through.
0b1011 Normal memory, Inner Write-Back, Outer Write-Through.
0b1101 Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110 Normal memory, Inner Write-Through, Outer Write-Back.
0b1111 Normal memory, Inner Write-Back, Outer Write-Back.
All other values are reserved.
--- Note ---
This is the same format as the VMAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:
• On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.
Memory type.
The memory type used for message signaled interrupts is **IMPLEMENTATION DEFINED**.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

```
+----------------+-------------------+
| 31 | 0 | IMPLEMENTATION DEFINED |
+----------------+-------------------+
```

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

**Accessing the ERRFHICR2:**
ERRFHICR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE8C</td>
<td>ERRFHICR2</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.17 ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

**Purpose**

Shows the status for the records in the group.

**Configurations**

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

**Attributes**

ERRGSR is a 64-bit register.

**Field descriptions**

![ERRGSR Register Diagram]

- **Bits [63:56]**
  - Reserved, RES0.

- **S<\(m\)>**, bit [\(m\)], for \(m = 55\) to 0

  *When error record \(<m>\) is implemented and error record \(<m>\) supports this type of reporting:*

  - The status for error record \(<m>\). A read-only copy of ERR<\(n\)>STATUS.V.
  - 0b0 No error.
  - 0b1 One or more errors.

  If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

**Accessing the ERRGSR:**

ERRGSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE00</td>
<td>ERRGSR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.8.18  ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

**Purpose**

Defines the implementer of the component.

**Configurations**

Implementation of this register is OPTIONAL.

This register is present only when RAS System Architecture v1.1 is implemented.

**Attributes**

ERRIIDR is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| 31-20 | ProductID      | Part number, bits [11:0]. The part number is selected by the designer of the component.  
            |                 | If ERRPIDR0 and ERRPIDR1 are implemented, ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.  |
| 19-16 | Variant        | Component major revision. This field distinguishes product variants or major revisions of the product.  
            |                 | If ERRPIDR2 is implemented, ERRPIDR2.REVISION matches ERRIIDR.Variant.  |
| 15-12 | Revision       | Component minor revision. This field distinguishes minor revisions of the product.  
            |                 | If ERRPIDR3 is implemented, ERRPIDR3.REVAND matches ERRIIDR.Revision.  |
| 11-0  | Implementer    | Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.  
            |                 | Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.  
            |                 | If ERRPIDR4 is implemented, ERRPIDR2 is implemented, and ERRPIDR1 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR.Implementer, ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR.Implementer, and ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR.Implementer.  |

**Accessing the ERRIIDR:**

ERRIIDR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE10</td>
</tr>
</tbody>
</table>
Accesses to this interface are RO.
5.8.19 ERRIMPDEF<\(n\)>, IMPLEMENTATION DEFINED Register \(n\), \(n = 0 \text{ - } 191\)

The ERRIMPDEF<\(n\)> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED RAS extensions.

**Configurations**

This register is present only when the Common Fault Injection Model Extension is not implemented, UInt(ERRDEVID.NUM) <= 32 and an implementation implements ERRIMPDEF<\(n\)>. Otherwise, direct accesses to ERRIMPDEF<\(n\)> are RES0.

**Attributes**

ERRIMPDEF<\(n\)> is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

**Accessing the ERRIMPDEF<\(n\)>:**

ERRIMPDEF<\(n\)> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x800 + (8 * (n))</td>
<td>ERRIMPDEF&lt;(n)&gt;</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
ERRIRQCR<\text{n}>, Generic Error Interrupt Configuration Register <\text{n}>, \text{n} = 0 - 15

The ERRIRQCR<\text{n}> characteristics are:

**Purpose**

The ERRIRQCR<\text{n}> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<\text{n}> registers. These registers are named:

- ERRFHIR0, ERRFHIR1, and ERRFHIR2 for the fault handling interrupt controls.
- ERRERI0, ERRERI1, and ERRERI2 for the error recovery interrupt controls.
- ERRIRICR0, ERRIRICR1, and ERRIRICR2 for the critical error interrupt controls.
- ERRIRQSR for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<\text{n}> are RES0.

ERRIRQCR<\text{n}> is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRIRQCR<\text{n}> is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

**Accessing the ERRIRQCR<\text{n}>**:

ERRIRQCR<\text{n}> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE80 + (8 * \text{n})</td>
<td>ERRIRQCR&lt;\text{n}&gt;</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
### 5.8.21 ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

**Purpose**
Interrupt status register.

**Configurations**
This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

**Attributes**
ERRIRQSR is a 64-bit register.

**Field descriptions**

*When the implementation uses the recommended layout for the ERRIRQCR<\textit{n}> registers:*

![Register Diagram]

**Bits [63:6]**
Reserved, RES0.

**CRIERR, bit [5]**

*When the Critical Error Interrupt is implemented:*
Critical Error Interrupt Error.

- **0b0** Critical Error Interrupt write has not returned an error since this field was last cleared to zero.
- **0b1** Critical Error Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:
- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.
Access to this field is W1C.

*Otherwise:*
Reserved, RES0.

**CRI, bit [4]**

*When the Critical Error Interrupt is implemented:*
Critical Error Interrupt write in progress.

- **0b0** Critical Error Interrupt write not in progress.
- **0b1** Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.
Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:
Reserved, RES0.

ERIERR, bit [3]

When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt Error.

0b0  Error Recovery Interrupt write has not returned an error since this field was last cleared to zero.

0b1  Error Recovery Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

•  On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

Otherwise:
Reserved, RES0.

ERI, bit [2]

When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt write in progress.

0b0  Error Recovery Interrupt write not in progress.

0b1  Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:
Reserved, RES0.

FHIERR, bit [1]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt Error.

0b0  Fault Handling Interrupt write has not returned an error since this field was last cleared to zero.

0b1  Fault Handling Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

•  On an Error recovery reset, this field resets to an architecturally UNKNOWN value.
Access to this field is W1C.

Otherwise:
Reserved, RES0.

FHI, bit [0]

When the Fault Handling Interrupt is implemented:
Fault Handling Interrupt write in progress.
0b0 Fault Handling Interrupt write not in progress.
0b1 Fault Handling Interrupt write in progress.
Software must not disable an interrupt whilst the write is in progress.

--- Note ---
This field does not indicate whether an interrupt is active, but rather whether a write triggered by
the interrupt is in progress.
To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS
registers.

Otherwise:
Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [63:0]
IMPLEMENTATION DEFINED.

Accessing the ERRIRQSR:
ERRIRQSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEF8</td>
<td>ERRIRQSR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.22 ERR<n>ADDR, Error Record <n> Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

**Purpose**

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

**Configurations**

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

**Attributes**

ERR<n>ADDR is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS</td>
<td>Non-secure attribute. With ERR&lt;n&gt;ADDR.NSE, indicates the physical address space of the recorded location.</td>
</tr>
<tr>
<td>SI</td>
<td>Secure address.</td>
</tr>
<tr>
<td>AI</td>
<td>Address in a Realm.</td>
</tr>
<tr>
<td>VA</td>
<td>Address in a VMA.</td>
</tr>
<tr>
<td>RES0</td>
<td>Reserved.</td>
</tr>
<tr>
<td>PADDR</td>
<td>Physical address.</td>
</tr>
</tbody>
</table>

**NS, bit [63]**

When FEAT_RME is implemented:

- Non-secure attribute. With ERR<n>ADDR.NSE, indicates the physical address space of the recorded location.
- 0b0 When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Secure address.
- 0b1 When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Root address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

- Non-secure attribute.
- 0b0 ERR<n>ADDR.PADDR is a Secure address.
- 0b1 ERR<n>ADDR.PADDR is a Non-secure address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
SI, bit [62]

When FEAT_RME is implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.{NS, NSE} are valid.

0b0 ERR<n>ADDR.{NS, NSE} are correct. That is, they match the programmers' view of the physical address space for the recorded location.

0b1 ERR<n>ADDR.{NS, NSE} might not be correct, and might not match the programmers' view of the physical address space for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

0b0 ERR<n>ADDR.NS is correct. That is, it matches the programmers' view of the Non-secure attribute for the recorded location.

0b1 ERR<n>ADDR.NS might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

0b0 ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.

0b1 ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

0b0 ERR<n>ADDR.PADDR is not a virtual address.

0b1 ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is 1, ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [59]

When FEAT_RME is implemented:

Physical Address Space. Together with ERR<n>ADDR.NS, indicates the address space for ERR<n>ADDR.PADDR.
The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [58:56]
Reserved, RES0.

PADDR, bits [55:0]
Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.
The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>ADDR:
ERR<n>ADDR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x018 + (64 * n)</td>
<td>ERR&lt;n&gt;ADDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When the Common Fault Injection Model Extension is implemented by the node that owns this error record, ERR<q>PFGF.AV == 0 and ERR<n>STATUS.AV == 1 accesses to this register are RO.
- When the Common Fault Injection Model Extension is not implemented by the node that owns this error record and ERR<n>STATUS.AV == 1 accesses to this register are RO.
- Otherwise accesses to this register are RW.
5.8.23 ERR<n>CTLR, Error Record <n> Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

**Purpose**

The error control register contains enable bits for the node that writes to this record:
- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

**Configurations**

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>CTLR is a 64-bit register.

**Field descriptions**

**IMPLEMENTATION DEFINED, bits [63:32]**

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

**Bits [31:14]**

Reserved, RES0.

**CI, bit [13]**

*When ERR<n>FR.CI == 0b10:*

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

- 0b0 Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
- 0b1 Critical error interrupt generated for critical errors.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.
Bit [12]

Reserved, RES0.

WDUI, bit [11]

When $ERR<n>FR.DUI == 0b11$:

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

$0b0$  Error recovery interrupt not generated for Deferred errors on writes.

$0b1$  Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DUI, bit [10]

When $ERR<n>FR.DUI == 0b10$:

$DUI$

Error recovery interrupt for Deferred errors enable.

When $ERR<n>FR.DUI == 0b10$, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

$0b0$  Error recovery interrupt not generated for Deferred errors.

$0b1$  Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<n>FR.DUI == 0b11$:

$RDUI$

Error recovery interrupt for Deferred errors on reads enable.

When $ERR<n>FR.DUI == 0b11$, this field is named RDUI.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

$0b0$  Error recovery interrupt not generated for Deferred errors on reads.

$0b1$  Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When $ERR<n>FR.CFI == 0b11$:

Fault handling interrupt for Corrected errors on writes enable.
When enabled:
- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

0b0  Fault handling interrupt not generated for Corrected errors on writes.
0b1  Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

CFI, bit [8]

**When ERR<n>FR.CFI == 0b10:**

CFI
Fault handling interrupt for Corrected errors enable.

When ERR<n>FR.CFI == 0b10, this control applies to errors arising from both reads and writes.

When enabled:
- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

0b0  Fault handling interrupt not generated for Corrected errors.
0b1  Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When ERR<n>FR.CFI == 0b11:**

RCFI
Fault handling interrupt for Corrected errors on reads enable.

When ERR<n>FR.CFI == 0b11, this field is named RCFI.

When enabled:
- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

0b0  Fault handling interrupt not generated for Corrected errors on reads.
0b1  Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**WUE, bit [7]**

*When \( ERR_n<FR.UE >= 0b11 \):*

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

0b0 In-band error response for uncorrected errors on writes disabled.

0b1 In-band error response for uncorrected errors on writes enabled.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**WFI, bit [6]**

*When \( ERR_n<FR.FI >= 0b11 \):*

Fault handling interrupt on writes enable.

When enabled:
- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on writes.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
  - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

0b0 Fault handling interrupt on writes disabled.

0b1 Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**WUI, bit [5]**

*When \( ERR_n<FR.UI >= 0b11 \):*

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

0b0 Error recovery interrupt on writes disabled.

0b1 Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UE, bit [4]**

*When ERR<\text{n}>FR.UE == 0b10:*  
**UE**  
In-band error response enable.  
When ERR<\text{n}>FR.UE == 0b10, this control applies to errors arising from both reads and writes. When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort). It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.  
0b0  In-band error response for uncorrected errors disabled.  
0b1  In-band error response for uncorrected errors enabled.  

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

*When ERR<\text{n}>FR.UE == 0b11:*  
**RUE**  
In-band error response on reads enable.  
When ERR<\text{n}>FR.UE == 0b11, this field is named RUE. When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort). It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.  
0b0  In-band error response for uncorrected errors on reads disabled.  
0b1  In-band error response for uncorrected errors on reads enabled.  

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**FI, bit [3]**

*When ERR<\text{n}>FR.FI == 0b10:*  
**FI**  
Fault handling interrupt enable.  
When ERR<\text{n}>FR.FI == 0b10, this control applies to errors arising from both reads and writes. When enabled:

- The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error.
- If the fault handling interrupt for Corrected errors control is not implemented:
  — If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
— Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

0b0  Fault handling interrupt disabled.
0b1  Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

When \( ERR<n>FR.FI == 0b11 \):  

**RFI**  
Fault handling interrupt on reads enable.

When \( ERR<n>FR.FI == 0b11 \), this field is named RFI.

When enabled:
• The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on reads.
• If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  — If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
  — Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

0b0  Fault handling interrupt on reads disabled.
0b1  Fault handling interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UI, bit [2]**

When \( ERR<n>FR.UI == 0b10 \):

**UI**  
Uncorrected error recovery interrupt enable.

When \( ERR<n>FR.UI == 0b10 \), this control applies to errors arising from both reads and writes.
When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

0b0  Error recovery interrupt disabled.
0b1  Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

When \( ERR<n>FR.UI == 0b11 \):

**RUI**  
Uncorrected error recovery interrupt on reads enable.

When \( ERR<n>FR.UI == 0b11 \), this field is named RUI.
When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

- **0b0** Error recovery interrupt on reads disabled.
- **0b1** Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**
Reserved, RES0.

**IMPLEMENTATION DEFINED, bit [1]**
Reserved for **IMPLEMENTATION DEFINED** controls. Must permit SBZP write policy for software.

**ED, bit [0]**

*When ERR<n>FR.ED == 0b10:*  
Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an **IMPLEMENTATION DEFINED** control for error injection.

- **0b0** Error reporting disabled.
- **0b1** Error reporting enabled.

It is **IMPLEMENTATION DEFINED** whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

**Note**
If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is **IMPLEMENTATION DEFINED**.

If the Cold reset value is 1, the reset values of other controls in this register are also **IMPLEMENTATION DEFINED** and should not be **UNKNOWN**.

The reset behavior of this field is:
- On a Cold reset, this field resets to an **IMPLEMENTATION DEFINED** value.

**Otherwise:**
Reserved, RES0.

**Accessing the ERR<n>CTLR:**

ERR<n>CTLR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x008 + (64 * n)</td>
<td>ERR&lt;n&gt;CTLR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
### 5.8.24 ERR<n>FR, Error Record <n> Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

**Purpose**

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

**Configurations**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

**Attributes**

ERR<n>FR is a 64-bit register.

**Field descriptions**

*When error record <n> is not the first error record owned by the node:*

![Diagram](image)

- **Bits [63:2]**
  
  Reserved, RES0.

- **ED, bits [1:0]**
  
  Error reporting and logging. Indicates error record <n> is not the first error record owned the node.
  
  - 0b00 Error record <n> is not the first error record owned by the node.
  
  This field reads as 0b00.

*When error record <n> is the first error record owned by the node:*

![Diagram](image)

- **IMPLEMENTATION DEFINED, bits [63:55]**
  
  When ERR<n>FR.FRX != 1:
  
  Reserved for identifying IMPLEMENTATION DEFINED controls.
Otherwise:
Reserved, RES0.

CE, bits [54:53]
When ERR<\text{n}>FR.FRX == 1:
Corrected Error recording. Describes the types of Corrected errors the node can record, if any.
- 0b00: Does not record Corrected errors.
- 0b01: Records only transient or persistent Corrected errors. That is, Corrected errors recorded
  by setting ERR<\text{n}>STATUS.CE to either 0b01 or 0b11.
- 0b10: Records only non-specific Corrected errors. That is, Corrected errors recorded by
  setting ERR<\text{n}>STATUS.CE to 0b10.
- 0b11: Records all types of Corrected error.
Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]
When ERR<\text{n}>FR.FRX == 1:
Deferred Error recording. Describes whether the node supports recording Deferred errors.
- 0b0: Does not record Deferred errors.
- 0b1: Records Deferred errors.
Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]
When ERR<\text{n}>FR.FRX == 1:
Latent or Restartable Error recording. Describes whether the node supports recording Latent or
Restartable errors.
- 0b0: Does not record Latent or Restartable errors.
- 0b1: Records Latent or Restartable errors.
Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]
When ERR<\text{n}>FR.FRX == 1:
Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled
or Recoverable errors.
- 0b0: Does not record Signaled or Recoverable errors.
- 0b1: Records Signaled or Recoverable errors.
Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]
When ERR<\text{n}>FR.FRX == 1:
Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable
errors.
- 0b0: Does not record Unrecoverable errors.
- 0b1: Records Unrecoverable errors.
Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.
UC, bit [48]

When ERR<\text{n}^>FR.FRX == 1:

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

0b0 Does not record Uncontainable errors.
0b1 Records Uncontainable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]

When RAS System Architecture v1.1 is implemented:

Feature Register extension. Defines whether ERR<\text{n}^>FR[63:48] are architecturally defined.

0b0 ERR<\text{n}^>FR[63:48] are IMPLEMENTATION DEFINED.
0b1 ERR<\text{n}^>FR[63:48] are defined by the architecture.

Otherwise:

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <\text{m}^> owned by this node, ERR<\text{n}^>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

0b00 Does not support a timestamp register.
0b01 Implements a timestamp register in ERR<\text{n}^>MISC3 for each error record <\text{m}^> owned by the node. The timestamp uses the same timebase as the system Generic Timer.

Note

For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE.

0b10 Implements a timestamp register in ERR<\text{n}^>MISC3 for each error record <\text{m}^> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

0b00 Does not support the critical error interrupt. ERR<\text{n}^>CTRL.CI is RES0.
0b01 Critical error interrupt is supported and always enabled. ERR<\text{n}^>CTRL.CI is RES0.
0b10 Critical error interrupt is supported and controllable using ERR<\text{n}^>CTRL.CI.

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

0b00 Does not support the Common Fault Injection Model Extension.
0b01 Supports the Common Fault Injection Model Extension. See ERR<\text{n}^>PFGF for more information.
All other values are reserved.

**CEO, bits [19:18]**

*When ERR<n>FR.CEC != 0b000:*

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

- **0b00** Keeps the previous error syndrome.
- **0b01** If ERR<n>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then ERR<n>STATUS.OF is set to 1.

This means, that if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

*Otherwise:*

Reserved, RES0.

**DUI, bits [17:16]**

*When ERR<n>FR.UI != 0b00:*

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

- **0b00** Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTRL.DUI is RES0.
- **0b10** Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTRL.DUI.
- **0b11** Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTRL.WDUI for writes and ERR<n>CTRL.RDUI for reads.

All other values are reserved.

*Otherwise:*

Reserved, RES0.

**RP, bit [15]**

*When ERR<n>FR.CEC != 0b000:*

Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.

- **0b0** Implements a single Corrected error counter in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.
- **0b1** Implements a first (repeat) counter and a second (other) counter in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

*Otherwise:*

Reserved, RES0.
CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.

- **0b000**: Does not implement the standard Corrected error counter model.
- **0b010**: Implements an 8-bit Corrected error counter in ERR<n>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.
- **0b100**: Implements a 16-bit Corrected error counter in ERR<n>MISC0[47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

--- Note ---

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

*When ERR<n>FR.FI != 0b00:*

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

- **0b0**: Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTRL.CFI is RES0.
- **0b10**: Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTRL.CFI.
- **0b11**: Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTRL.WCFI for writes and ERR<n>CTRL.RCFI for reads.

All other values are reserved.

*Otherwise:*

Reserved, RES0.

UE, bits [9:8]

In-band error response (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node.

- **0b0**: Does not support the in-band error response. ERR<n>CTRL.UE is RES0.
- **0b1**: In-band error response is supported and always enabled. ERR<n>CTRL.UE is RES0.
- **0b10**: In-band error response is supported and controllable using ERR<n>CTRL.UE.
- **0b11**: In-band error response is supported, and controllable using ERR<n>CTRL.WUE for writes and ERR<n>CTRL.RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

- **0b0**: Does not support the fault handling interrupt. ERR<n>CTRL.FI is RES0.
- **0b1**: Fault handling interrupt is supported and always enabled. ERR<n>CTRL.FI is RES0.
- **0b10**: Fault handling interrupt is supported and controllable using ERR<n>CTRL.FI.
- **0b11**: Fault handling interrupt is supported, and controllable using ERR<n>CTRL.WFI for writes and ERR<n>CTRL.RFI for reads.
UI, bits [5:4]
Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.
0b00  Does not support the error handling interrupt. ERR<n>CTRL.UI is RES0.
0b01  Error handling interrupt is supported and always enabled. ERR<n>CTRL.UI is RES0.
0b10  Error handling interrupt is supported and controllable using ERR<n>CTRL.UI.
0b11  Error handling interrupt is supported, and controllable using ERR<n>CTRL.WUI for writes and ERR<n>CTRL.RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]
IMPLEMENTATION DEFINED.

ED, bits [1:0]
Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.
0b01  Error reporting and logging always enabled. ERR<n>CTRL.ED is RES0.
0b10  Error reporting and logging is controllable using ERR<n>CTRL.ED.
All other values are reserved.

Accessing the ERR<n>FR:
ERR<n>FR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x000 + (64 * n)</td>
<td>ERR&lt;n&gt;-FR</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.8.25 ERR<n>MISC0, Error Record <n> Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined Corrected error counters (ERR<n>FR.CEC != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined Corrected error counter or counters.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

--- Note ---

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

**Attributes**

ERR<n>MISC0 is a 64-bit register.

**Field descriptions**

*When ERR<q>FR.CEC == 0b000:*

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [63:48]
IMPLEMENTATION DEFINED syndrome.

OF, bit [47]
Sticky overflow bit. Set to 1 when $ERR<n>MISC0.CEC$ is incremented and wraps through zero.
0b0 Counter has not overflowed.
0b1 Counter has overflowed.
A direct write that modifies this field might indirectly set $ERR<n>STATUS.OF$ to an UNKNOWN value and a direct write to $ERR<n>STATUS.OF$ that clears it to zero might indirectly set this field to an UNKNOWN value.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]
Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<q>FR.CEC == 0b010$ and $ERR<q>FR.RP == 0$: 

<table>
<thead>
<tr>
<th>63</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td>OF</td>
<td>CEC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [63:40]
IMPLEMENTATION DEFINED syndrome.

OF, bit [39]
Sticky overflow bit. Set to 1 when $ERR<n>MISC0.CEC$ is incremented and wraps through zero.
0b0 Counter has not overflowed.
0b1 Counter has overflowed.
A direct write that modifies this field might indirectly set $ERR<n>STATUS.OF$ to an UNKNOWN value and a direct write to $ERR<n>STATUS.OF$ that clears it to zero might indirectly set this field to an UNKNOWN value.
The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.
CEC, bits [38:32]
Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]
IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 1:

OFO, bit [63]
Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

0b0 Other counter has not overflowed.
0b1 Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]
Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]
Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

0b0 Repeat counter has not overflowed.
0b1 Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]
Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.
Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

<table>
<thead>
<tr>
<th>63</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

0b0 Other counter has not overflowed.
0b1 Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

0b0 Repeat counter has not overflowed.
0b1 Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the ERR<n>MISC0:

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x020 + (64 * n)</td>
<td>ERR&lt;n&gt;MISC0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.26 **ERR<n>MISC1, Error Record <n> Miscellaneous Register 1, n = 0 - 65534**

The ERR<n>MISC1 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

**Configurations**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

**Attributes**

ERR<n>MISC1 is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit 63</th>
<th>Bit 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED syndrome.

**Accessing the ERR<n>MISC1:**

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.
For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

**Note**

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>$0x028 + (64 * n)$</td>
<td>ERR&lt;n&gt;MISC1</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.27 ERR<\text{n}>MISC2, Error Record <\text{n}> Miscellaneous Register 2, \text{n} = 0 - 65534

The ERR<\text{n}>MISC2 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

**Configurations**

This register is present only when (an implementation implements ERR<\text{n}>MISC2 or RAS System Architecture v1.1 is implemented) and error record <\text{n}> is implemented. Otherwise, direct accesses to ERR<\text{n}>MISC2 are RES0.

ERR<\text{n}>FR describes the features implemented by the node that owns error record <\text{n}>. <\text{q}> is the index of the first error record owned by the same node as error record <\text{n}>. If the node owns a single record, then <\text{q} > = <\text{n}>.

For IMPLEMENTATION DEFINED fields in ERR<\text{n}>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<\text{n}>MISC2 does not require zeroing to return the record to a quiescent state.

---

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<\text{n}>CTLR.

---

**Attributes**

ERR<\text{n}>MISC2 is a 64-bit register.

**Field descriptions**

![ IMPLEMENTATION DEFINED, bits [63:0] ]

IMPLEMENTATION DEFINED syndrome.

**Accessing the ERR<\text{n}>MISC2:**

Reads from ERR<\text{n}>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.
If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and \( \text{ERR}_n\text{-PFGF.MV} \) is 1, then some parts of this register are read/write when \( \text{ERR}_n\text{-STATUS.MV} \) is 0. See \( \text{ERR}_n\text{-PFGF.MV} \) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When \( \text{ERR}_n\text{-STATUS.MV} \) is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

--- Note ---

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR\( _n \)-MISC2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x030 + (64 * n)</td>
<td>( \text{ERR}_n\text{-MISC2} )</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.28 ERR<\(n\)>MISC3, Error Record \(<n\>\) Miscellaneous Register 3, \(n = 0 - 65534\)

The ERR<\(n\)>MISC3 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record \(n\) supports the RAS Timestamp Extension (ERR<\(n\)>FR.TS \(!= 0b00\)), then ERR<\(n\)>MISC3 contains the timestamp value for error record \(n\) when the error was detected. Otherwise the contents of ERR<\(n\)>MISC3 are IMPLEMENTATION DEFINED.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

**Configurations**

This register is present only when (an implementation implements ERR<\(n\)>MISC3 or RAS System Architecture v1.1 is implemented) and error record \(<n\>\) is implemented. Otherwise, direct accesses to ERR<\(n\)>MISC3 are RES0.

ERR<\(n\)>FR describes the features implemented by the node that owns error record \(<n\>\). \(<q\>\) is the index of the first error record owned by the same node as error record \(<n\>\). If the node owns a single record, then \(q = n\).

For IMPLEMENTATION DEFINED fields in ERR<\(n\)>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<\(n\)>MISC3 does not require zeroing to return the record to a quiescent state.

--- **Note** ---

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<\(n\)>CTLR.

**Attributes**

ERR<\(n\)>MISC3 is a 64-bit register.

**Field descriptions**

*When ERR<\(q\)>FR.TS \(!= 0b00\):*

![TS field diagram](image-url)
TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if ERR<\text{n}>STATUS.V == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO or RW.

When ERR<\text{q}>FR.TS == 0b00:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>

<td>RAS</td>
<td>0x038 + (64 * \text{n})</td>
<td>ERR&lt;\text{n}&gt;MISC3</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
ERR<n>PFGCDN, Error Record <n> Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

**Purpose**

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0. ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGCDN is a 64-bit register.

**Field descriptions**

## 5.8.30 ERR<n>PFGCTL, Error Record <n> Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

**Purpose**

Enables controlled fault generation.

**Configurations**

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

ERR<n>PFGF describes the Common Fault Injection features implemented by the node.

**Attributes**

ERR<n>PFGCTL is a 64-bit register.

**Field descriptions**

![Field Diagram]

**Bits [63:32]**

Reserved, RES0.

**CDNEN, bit [31]**

Countdown Enable. Controls transfers of the value held in ERR<n>PFGCDN to the Error Generation Counter and enables this counter.

- 0b0 The Error Generation Counter is disabled.
- 0b1 The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

**R, bit [30]**

*When the node supports this control:

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

- 0b0 On reaching zero, the Error Generation Counter will stop counting.
- 0b1 On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [29:13]**

Reserved, RES0.
Bit [12]

When the node supports this control and the node always sets ERR<\(n\)>STATUS.MV to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Miscellaneous syndrome. The value written to ERR<\(n\)>STATUS.MV when an injected error is recorded.

- 0b0: ERR<\(n\)>STATUS.MV is set to 0 when an injected error is recorded.
- 0b1: ERR<\(n\)>STATUS.MV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the node always sets ERR<\(n\)>STATUS.MV to 0b1 when an injected error is recorded and this field is RAO/WI:

Reserved, RAO/WI.

Otherwise:

Reserved, RES0.

Bit [11]

When the node supports this control, and the node always sets ERR<\(n\)>STATUS.AV to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Address syndrome. The value written to ERR<\(n\)>STATUS.AV when an injected error is recorded.

- 0b0: ERR<\(n\)>STATUS.AV is set to 0 when an injected error is recorded.
- 0b1: ERR<\(n\)>STATUS.AV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PN, bit [10]

When the node supports this control:

Poison flag. The value written to ERR<\(n\)>STATUS.PN when an injected error is recorded.

- 0b0: ERR<\(n\)>STATUS.PN is set to 0 when an injected error is recorded.
- 0b1: ERR<\(n\)>STATUS.PN is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]

When the node supports this control:

Error Reported flag. The value written to ERR<\(n\)>STATUS.ER when an injected error is recorded.

- 0b0: ERR<\(n\)>STATUS.ER is set to 0 when an injected error is recorded.
- 0b1: ERR<\(n\)>STATUS.ER is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

CI, bit [8]

When the node supports this control:
Critical Error flag. The value written to ERR<n>STATUS.CI when an injected error is recorded.

0b0    ERR<n>STATUS.CI is set to 0 when an injected error is recorded.
0b1    ERR<n>STATUS.CI is set to 1 when an injected error is recorded.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

CE, bits [7:6]

When the node supports this control:
Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

0b00    An injected Corrected error will not be generated by the fault injection feature of the node.
0b01    An injected non-specific Corrected error is generated in the fault injection state.
ERR<n>STATUS.CE is set to 0b10 when the injected error is recorded.
0b10    An injected transient Corrected error is generated in the fault injection state.
ERR<n>STATUS.CE is set to 0b01 when the injected error is recorded.
0b11    An injected persistent Corrected error is generated in the fault injection state.
ERR<n>STATUS.CE is set to 0b11 when the injected error is recorded.

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

DE, bit [5]

When the node supports this control:
Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

0b0    An injected Deferred error will not be generated by the fault generation feature of the node.
0b1    An injected Deferred error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
UEO, bit [4]

*When the node supports this control:*

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

0b0  An injected Latent or Restartable error will not be generated by the fault generation feature of the node.

0b1  An injected Latent or Restartable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

* On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

UER, bit [3]

*When the node supports this control:*

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

0b0  An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.

0b1  An injected Signaled or Recoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

* On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

UEU, bit [2]

*When the node supports this control:*

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

0b0  An injected Unrecoverable error will not be generated by the fault generation feature of the node.

0b1  An injected Unrecoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

* On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.
UC, bit [1]

When the node supports this control:

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

0b0 An injected Uncontainable error will not be generated by the fault generation feature of the node.

0b1 An injected Uncontainable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]

When the node supports this control:

Overflow flag. The value written to ERR<n>STATUS.OF when an injected error is recorded.

0b0 ERR<n>STATUS.OF is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.OF is set to 1 when an injected error is recorded.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the ERR<n>PFGCTL:

ERR<n>PFGCTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x808 + (64 * n)</td>
<td>ERR&lt;n&gt;PFGCTL</td>
</tr>
</tbody>
</table>

Accesses to this interface are RW.
I5.8.31 ERR<n>PFGF, Error Record <n> Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

**Purpose**
Defines which common architecturally-defined fault generation features are implemented.

**Configurations**
This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**
ERR<n>PFGF is a 64-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:31]</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>

<td>0b0</td>
<td>The node does not support this feature. ERR&lt;n&gt;PFGCTL.R is RES0.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Error Generation Counter restart mode is implemented and is controlled by ERR&lt;n&gt;PFGCTL.R. ERR&lt;n&gt;PFGCTL.R is a read/write field.</td>
<td></td>
</tr>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node sets ERR&lt;n&gt;STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR&lt;n&gt;STATUS.{IERR, SERR} are UNKNOWN when ERR&lt;n&gt;STATUS.V is 0.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, the node does not update the ERR&lt;n&gt;STATUS.{IERR, SERR} fields. ERR&lt;n&gt;STATUS.{IERR, SERR} are writable when ERR&lt;n&gt;STATUS.V is 0.</td>
<td></td>
</tr>
<tr>
<td>[28]</td>
<td>NA, bit</td>
<td>No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.</td>
</tr>
<tr>
<td>0b0</td>
<td>The component fakes detection of the error on an access to the component.</td>
<td></td>
</tr>
</tbody>
</table>
The component fakes detection of the error spontaneously in the fault injection state.

**Bits [27:13]**

Reserved, RES0.

**MV, bit [12]**

Miscellaneous syndrome.

Defines whether software can control all or part of the syndrome recorded in the ERR<\text{n}>MISC<\text{m}> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which ERR<\text{n}>MISC<\text{m}> syndrome fields, if any, are updated by the node when an injected error is recorded. Some syndrome fields might always be updated by the node when an error, including an injected error, is recorded. For example, a corrected error counter might always be updated when any countable error, including a injected countable error, is recorded.

0b0 When an injected error is recorded, the node might update the ERR<\text{n}>MISC<\text{m}> registers:

- If any syndrome is recorded by the node in the ERR<\text{n}>MISC<\text{m}> registers, then ERR<\text{n}>STATUS.MV is set to 1.
- Otherwise, ERR<\text{n}>STATUS.MV is unchanged.

If the node always sets ERR<\text{n}>STATUS.MV to 1 when recording an injected error then ERR<\text{n}>PFGCTL.MV might be RAO/WI. Otherwise ERR<\text{n}>PFGCTL.MV is RES0.

0b1 When an injected error is recorded, the node might update some, but not all ERR<\text{n}>MISC<\text{m}> syndrome fields:

- If any syndrome is recorded by the node in the ERR<\text{n}>MISC<\text{m}> registers, then ERR<\text{n}>STATUS.MV is set to 1.
- Otherwise, ERR<\text{n}>STATUS.MV is set to ERR<\text{n}>PFGCTL.MV.

ERR<\text{n}>MISC<\text{m}> syndrome fields that are not updated by the node are writable when ERR<\text{n}>STATUS.MV is 0.

If the node always sets ERR<\text{n}>STATUS.MV to 1 when recording an injected error then ERR<\text{n}>PFGCTL.MV is RAO/WI. Otherwise ERR<\text{n}>PFGCTL.MV is a read/write field.

If ERR<\text{n}>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<\text{n}>MISC<\text{m}> registers when setting up a fault injection event. The permitted values that can be written to these registers are IMPLEMENTATION DEFINED.

**AV, bit [11]**

Address syndrome. Defines whether software can control the address recorded in ERR<\text{n}>ADDR when an injected error is recorded.

0b0 When an injected error is recorded, the node might record an address in ERR<\text{n}>ADDR. If an address is recorded in ERR<\text{n}>ADDR, then ERR<\text{n}>STATUS.AV is set to 1. Otherwise, ERR<\text{n}>ADDR and ERR<\text{n}>STATUS.AV are unchanged.

If the node always records an address and sets ERR<\text{n}>STATUS.AV to 1 when recording an injected error then ERR<\text{n}>PFGCTL.AV might be RAO/WI. Otherwise ERR<\text{n}>PFGCTL.AV is RES0.

0b1 When an injected error is recorded, the node does not update ERR<\text{n}>ADDR and does one of:

- Sets ERR<\text{n}>STATUS.AV to ERR<\text{n}>PFGCTL.AV. ERR<\text{n}>PFGCTL.AV is a read/write field.
- Sets ERR<\text{n}>STATUS.AV to 1. ERR<\text{n}>PFGCTL.AV is RAO/WI.

ERR<\text{n}>ADDR is writable when ERR<\text{n}>STATUS.AV is 0.

If ERR<\text{n}>PFGF.AV is 1, software can write a specific address value into ERR<\text{n}>ADDR when setting up a fault injection event.
PN, bit [10]

*When the node supports this flag:*

Poison flag. Describes how the fault generation feature of the node sets the \(\text{ERR}<\text{n}>\text{STATUS}.\text{PN}\) status flag.

- \(0b0\) When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets \(\text{ERR}<\text{n}>\text{STATUS}.\text{PN}\) to 1. \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{PN}\) is \text{RES0}.

- \(0b1\) When an injected error is recorded, \(\text{ERR}<\text{n}>\text{STATUS}.\text{PN}\) is set to \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{PN}\). \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{PN}\) is a read/write field.

This behavior replaces the architecture-defined rules for setting the \(\text{ERR}<\text{n}>\text{STATUS}.\text{PN}\) bit.

*Otherwise:*

Reserved, RAZ.

ER, bit [9]

*When the node supports this flag:*

Error Reported flag. Describes how the fault generation feature of the node sets the \(\text{ERR}<\text{n}>\text{STATUS}.\text{ER}\) status flag.

- \(0b0\) When an injected error is recorded, the node sets \(\text{ERR}<\text{n}>\text{STATUS}.\text{ER}\) according to the architecture-defined rules for setting the ER field. \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{ER}\) is \text{RES0}.

- \(0b1\) When an injected error is recorded, \(\text{ERR}<\text{n}>\text{STATUS}.\text{ER}\) is set to \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{ER}\). This behavior replaces the architecture-defined rules for setting the ER bit. \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{ER}\) is a read/write field.

*Otherwise:*

Reserved, RAZ.

CI, bit [8]

*When the node supports this flag:*

Critical Error flag. Describes how the fault generation feature of the node sets the \(\text{ERR}<\text{n}>\text{STATUS}.\text{CI}\) status flag.

- \(0b0\) When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets \(\text{ERR}<\text{n}>\text{STATUS}.\text{CI}\) to 1. \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CI}\) is \text{RES0}.

- \(0b1\) When an injected error is recorded, \(\text{ERR}<\text{n}>\text{STATUS}.\text{CI}\) is set to \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CI}\). \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CI}\) is a read/write field.

This behavior replaces the architecture-defined rules for setting the \(\text{ERR}<\text{n}>\text{STATUS}.\text{CI}\) bit.

*Otherwise:*

Reserved, RAZ.

CE, bits [7:6]

*When the node supports this type of error:*

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

- \(0b00\) The fault generation feature of the node does not generate Corrected errors. \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CE}\) is \text{RES0}.

- \(0b01\) The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting \(\text{ERR}<\text{n}>\text{STATUS}.\text{CE}\) to \(0b10\). \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CE}\) is a read/write field. The values \(0b10\) and \(0b11\) in \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CE}\) are reserved.

- \(0b11\) The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting \(\text{ERR}<\text{n}>\text{STATUS}.\text{CE}\) to \(0b01\) or \(0b11\) respectively. \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CE}\) is a read/write field. The value \(0b01\) in \(\text{ERR}<\text{n}>\text{PFGCTL}.\text{CE}\) is reserved.

All other values are reserved.
If $ERR_{i}^{n}$FR.FR.X is 1, then $ERR_{i}^{n}$FR.CE indicates whether the node supports this type of error.

**Otherwise:**

Reserved, RAZ.

**DE, bit [5]**

*When the node supports this type of error:*

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

- $0b0$: The fault generation feature of the node does not generate Deferred errors. $ERR_{i}^{n}$PFGCTRL.DE is RES0.
- $0b1$: The fault generation feature of the node allows generation of Deferred errors. $ERR_{i}^{n}$PFGCTRL.DE is a read/write field.

*Otherwise:*

Reserved, RAZ.

**UEO, bit [4]**

*When the node supports this type of error:*

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

- $0b0$: The fault generation feature of the node does not generate Latent or Restartable errors. $ERR_{i}^{n}$PFGCTRL.UEO is RES0.
- $0b1$: The fault generation feature of the node allows generation of Latent or Restartable errors. $ERR_{i}^{n}$PFGCTRL.UEO is a read/write field.

*Otherwise:*

Reserved, RAZ.

**UER, bit [3]**

*When the node supports this type of error:*

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

- $0b0$: The fault generation feature of the node does not generate Signaled or Recoverable errors. $ERR_{i}^{n}$PFGCTRL.UER is RES0.
- $0b1$: The fault generation feature of the node allows generation of Signaled or Recoverable errors. $ERR_{i}^{n}$PFGCTRL.UER is a read/write field.

*Otherwise:*

Reserved, RAZ.

**UEU, bit [2]**

*When the node supports this type of error:*

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

- $0b0$: The fault generation feature of the node does not generate Unrecoverable errors. $ERR_{i}^{n}$PFGCTRL.UEU is RES0.
- $0b1$: The fault generation feature of the node allows generation of Unrecoverable errors. $ERR_{i}^{n}$PFGCTRL.UEU is a read/write field.
If ERR<n>FR.FRX is 1, then ERR<n>FR.UEU indicates whether the node supports this type of error.

**Otherwise:**
Reserved, RAZ.

**UC, bit [1]**

*When the node supports this type of error:*
Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

0b0 The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL.UC is RES0.

0b1 The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL.UC is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UC indicates whether the node supports this type of error.

**Otherwise:**
Reserved, RAZ.

**OF, bit [0]**

*When the node supports this flag:*
Overflow flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.OF status flag.

0b0 When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL.OF is RES0.

0b1 When an injected error is recorded, ERR<n>STATUS.OF is set to ERR<n>PFGCTL.OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL.OF is a read/write field.

**Otherwise:**
Reserved, RAZ.

**Accessing the ERR<n>PFGF:**

ERR<n>PFGF can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x800 + (64 * n)</td>
<td>ERR&lt;n&gt;PFGF</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
**Err<n>STATUS, Error Record <n> Primary Status Register, n = 0 - 65534**

The Err<n>STATUS characteristics are:

**Purpose**

Contains status information for error record <n>, including:
- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:
- Err<n>STATUS. {AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- Err<n>STATUS. {UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- Err<n>STATUS. {CI, ER, PN, IERR, SERR} are syndrome fields.

**Configurations**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to Err<n>STATUS are RES0.

Err<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in Err<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

--- **Note** ---

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in Err<n>CTRL.

--- **Attributes** ---

Err<n>STATUS is a 64-bit register.
Field descriptions

When RAS System Architecture v1.1 is implemented:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>A V, bit</td>
</tr>
<tr>
<td>30</td>
<td>V, bit</td>
</tr>
<tr>
<td>29</td>
<td>UE, bit</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

0b0 ERR<n>ADDR not valid.

0b1 ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

• On a Cold reset, this field resets to 0.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

0b0 ERR<n>STATUS not valid.

0b1 ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

• On a Cold reset, this field resets to 0.

Access to this field is W1C.

UE, bit [29]

Uncorrected Error.

0b0 No errors have been detected, or all detected errors have been either corrected or deferred.

0b1 At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.

• Otherwise, access to this field is W1C
**External System Control Register Descriptions**

**15.8 RAS register descriptions**

---

### ER, bit [28]

**Error Reported.**

- **0b0**: No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
- **0b1**: An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true:
  - The applicable one of the `ERR<n>CTLR.{WUE, RUE, UE}` fields is implemented and was 1 when an error was detected and not corrected.
  - The applicable one of the `ERR<n>CTLR.{WUE, RUE, UE}` fields is not implemented and the component always reports errors.

It is **IMPLEMENTATION DEFINED** whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

---

**Note**

An in-band error response signaled by the component might be masked and not generate any exception.

---

When clearing `ERR<n>STATUS.V` to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- **On a Cold reset, this field resets to an architecturally UNKNOWN value.**

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
  - `ERR<n>STATUS.UE == 0`
  - `ERR<n>STATUS.DE == 0`
  - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
  - `ERR<n>STATUS.UE == 0`
  - this field is never set to 0b1 by a Deferred error
- **When `ERR<n>STATUS.V == 0`, access to this field is UNKNOWN/WI.**
- **Otherwise, access to this field is W1C**

---

### OF, bit [27]

**Overflow.**

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- `ERR<n>STATUS.V` was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- `ERR<n>STATUS.V` was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

- **0b0**: Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1 Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C

MV, bit [26]

*When error record <n> includes an additional information for an error:*

Miscellaneous Registers Valid.

0b0 ERR<n>MISC<m> not valid.
0b1 The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

**Note**

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:
- On a Cold reset, this field resets to 0.

Access to this field is W1C.

*Otherwise:*

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

0b00 No errors were corrected.
0b01 At least one transient error was corrected.
0b10 At least one error was corrected.
0b11 At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C

DE, bit [23]

Deferred Error.

0b0 No errors were deferred.
0b1 At least one error was not corrected and deferred.
Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C

PN, bit [22]

Poison.

0b0  Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.

0b1  Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - ERR<n>STATUS.V == 0
  - ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0
- Otherwise, access to this field is W1C

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

0b00  Uncorrected error, Uncontainable error (UC).

0b01  Uncorrected error, Unrecoverable error (UEU).

0b10  Uncorrected error, Latent or Restartable error (UEO).

0b11  Uncorrected error, Signaled or Recoverable error (UER).

--- Note ---

Software might use the information in the error record registers to determine what recovery is necessary.

---

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
  - ERR<n>STATUS.V == 0
  - ERR<n>STATUS.UE == 0
- Otherwise, access to this field is W1C

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

0b0  No critical error condition.

0b1  Critical error condition.
When clearing ERR<\textless{}n\textgreater{}STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<\textless{}n\textgreater{}STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C

### Bits [18:16]

Reserved, RES0.

### IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<\textless{}n\textgreater{}STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<\textless{}n\textgreater{}MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

______ Note ______

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
  - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
  - ERR<\textless{}n\textgreater{}STATUS.V == 0
- UNKNOWN/WI if all of the following are true:
  - ERR<q>PFGF.SYN == 0
  - ERR<\textless{}n\textgreater{}STATUS.V == 0
- Otherwise, access to this field is RW

### SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

0x00  No error.
0x01  IMPLEMENTATION DEFINED error.
0x02  Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03  IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04  Assertion failure. For example, consistency failure.
0x05  Error detected on internal data path. For example, parity on ALU result.
0x06  Data value from associative memory. For example, ECC error on cache data.
0x07  Address/control value from associative memory. For example, ECC error on cache tag.
0x08  Data value from a TLB. For example, ECC error on TLB data.
0x09  Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A  Data value from producer. For example, parity error on write data bus.
0x0B  Address/control value from producer. For example, parity error on address bus.
0x0C  Data value from (non-associative) external memory. For example, ECC error in SDRAM.

0x0D  Illegal address (software fault). For example, access to unpopulated memory.

0x0E  Illegal access (software fault). For example, byte write to word register.

0x0F  Illegal state (software fault). For example, device not ready.

0x10  Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.

0x11  Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.

0x12  Error response from Completer of access. For example, error response from cache write-back.

0x13  External timeout. For example, timeout on interaction with another component.

0x14  Internal timeout. For example, timeout on interface within the component.

0x15  Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.

0x16  Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.

0x17  Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.

0x18  Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.

0x19  Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

0x1A  Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note
This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
• UNKNOWN/WI if all of the following are true:
  — the Common Fault Injection Model Extension is not implemented by the node that owns this error record
  — ERR<n>STATUS.V == 0
• UNKNOWN/WI if all of the following are true:
  — ERR<q>PFGF.SYN == 0
  — ERR<n>STATUS.V == 0
• Otherwise, access to this field is RW

**Bits [63:32]**

Reserved, RES0.

**AV, bit [31]**

*When error record <n> includes an address associated with an error:*

Address Valid.

0b0   ERR<n>ADDR not valid.
0b1   ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO if all of the following are true:
  - ERR<n>STATUS.DE == 0
  - ERR<n>STATUS.UE == 0
  - ERR<n>STATUS.CE != 0b00
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write

- RO if all of the following are true:
  - ERR<n>STATUS.DE != 0
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write

- RO if all of the following are true:
  - ERR<n>STATUS.UE != 0
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write

- Otherwise, access to this field is W1C

**Otherwise:**

Reserved, RES0.

**V, bit [30]**

Status Register Valid.

0b0   ERR<n>STATUS not valid.
0b1   ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO if all of the following are true:
  - ERR<n>STATUS.CE != 0b00
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write

- RO if all of the following are true:
  - ERR<n>STATUS.DE != 0
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write

- Otherwise, access to this field is W1C
• RO if all of the following are true:
  — ERR<n>STATUS.UE != 0
  — ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
• Otherwise, access to this field is W1C

**UE, bit [29]**

Uncorrected Error.

0b0 No errors have been detected, or all detected errors have been either corrected or deferred.

0b1 At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
• RO if all of the following are true:
  — ERR<n>STATUS.OF == 1
  — ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
• Otherwise, access to this field is W1C

**ER, bit [28]**

Error Reported.

0b0 No in-band error response (External Abort) signaled to the Requester making the access or other transaction.

0b1 An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true:

• The applicable one of the ERR<n>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected.
• The applicable one of the ERR<n>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

_________ Note ___________

An in-band error response signaled by the component might be masked and not generate any exception.

_________ Note ___________

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

• Clearing ERR<n>STATUS.V to 0.
• Clearing ERR<n>STATUS.UE to 0, if this field is never set to 1 by a Deferred error.
• Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• UNKNOWN/WI if all of the following are true:
  — ERR<n>STATUS.UE == 0
  — ERR<n>STATUS.DE == 0
— this field can be set to 0b1 by a Deferred error

• **UNKNOWN/WI** if all of the following are true:
  — ERR<n>STATUS.UE == 0
  — this field is never set to 0b1 by a Deferred error

• When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.

• **RO** if all of the following are true:
  — ERR<n>STATUS.DE == 0
  — ERR<n>STATUS.UE == 0
  — ERR<n>STATUS.CE != 0b00
  — ERR<n>STATUS.CE is not being cleared to 0b00 in the same write

• RO if all of the following are true:
  — ERR<n>STATUS.DE == 0
  — ERR<n>STATUS.UE != 0
  — ERR<n>STATUS.DE is not being cleared to 0b0 in the same write

• RO if all of the following are true:
  — ERR<n>STATUS.UE == 0
  — ERR<n>STATUS.DE != 0
  — ERR<n>STATUS.DE is not being cleared to 0b0 in the same write

• Otherwise, access to this field is W1C

**OF, bit [27]**

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

• An Uncorrected error is detected and ERR<n>STATUS.UE == 1.

• A Deferred error is detected, ERR<n>STATUS.DE == 0 and ERR<n>STATUS.DE == 1.

• A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.

• A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

• A Deferred error is detected and ERR<n>STATUS.UE == 1.

• A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.UE, DE] != [0, 0].

• A Corrected error counter is implemented, ERR<n>STATUS.UE, DE] != [0, 0], and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

• An Uncorrected error is detected and ERR<n>STATUS.UE == 0.

• A Deferred error is detected, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.DE == 0.

• A Corrected error is detected, ERR<n>STATUS.DE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b0.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

• A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.

• A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

0b0  

If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded.
If ERR<\textsubscript{n}>STATUS.UE == 0 and ERR<\textsubscript{n}>STATUS.DE == 1, then no error syndrome
for a Deferred error has been discarded.

If ERR<\textsubscript{n}>STATUS.UE == 0, ERR<\textsubscript{n}>STATUS.DE == 0, and a Corrected error
counter is implemented, then the counter has not overflowed.

If ERR<\textsubscript{n}>STATUS.UE == 0, ERR<\textsubscript{n}>STATUS.DE == 0, ERR<\textsubscript{n}>STATUS.CE != 0b00,
and no Corrected error counter is implemented, then no error syndrome for a
Corrected error has been discarded.

--- Note ---

This field might have been set to 1 when an error syndrome was discarded and later
cleared to 0 when a higher priority syndrome was recorded.

---

0b1

At least one error syndrome has been discarded or, if a Corrected error counter is
implemented, it might have overflowed.

When clearing ERR<\textsubscript{n}>STATUS.V to 0, if this field is nonzero, then Arm recommends that
software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• When ERR<\textsubscript{n}>STATUS.V == 0, access to this field is UNKNOWN/WI.

• Otherwise, access to this field is WIC

\textit{MV, bit [26]}

\textit{When error record \textlt{n} includes an additional information for an error:}

Miscellaneous Registers Valid.

0b0   ERR<\textsubscript{n}>MISC<\textsubscript{m}> not valid.

0b1   The IMPLEMENTATION DEFINED contents of the ERR<\textsubscript{n}>MISC<\textsubscript{m}> registers contains
additional information for an error recorded by this record.

--- Note ---

If the ERR<\textsubscript{n}>MISC<\textsubscript{m}> registers can contain additional information for a previously recorded
error, then the contents must be self-describing to software or a user. For example, certain fields
might relate only to Corrected errors, and other fields only to the most recent error that was not
discarded.

---

The reset behavior of this field is:

• On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

• RO if all of the following are true:
  — ERR<\textsubscript{n}>STATUS.DE == 0
  — ERR<\textsubscript{n}>STATUS.UE == 0
  — ERR<\textsubscript{n}>STATUS.CE != 0b00
  — ERR<\textsubscript{n}>STATUS.CE is not being cleared to 0b00 in the same write

• RO if all of the following are true:
  — ERR<\textsubscript{n}>STATUS.UE == 0
  — ERR<\textsubscript{n}>STATUS.DE != 0
  — ERR<\textsubscript{n}>STATUS.DE is not being cleared to 0b0 in the same write

• RO if all of the following are true:
  — ERR<\textsubscript{n}>STATUS.UE != 0
  — ERR<\textsubscript{n}>STATUS.UE is not being cleared to 0b0 in the same write

• Otherwise, access to this field is WIC
Otherwise:
Reserved, RES0.

CE, bits [25:24]
Corrected Error.

- 0b00: No errors were corrected.
- 0b01: At least one transient error was corrected.
- 0b10: At least one error was corrected.
- 0b11: At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
- When ERR<STATUS.V == 0, access to this field is UNKNOWN/WI.
- RO if all of the following are true:
  - ERR<STATUS.OF == 1
  - ERR<STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is W1C

DE, bit [23]
Deferred Error.

- 0b0: No errors were deferred.
- 0b1: At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:
- When ERR<STATUS.V == 0, access to this field is UNKNOWN/WI.
- RO if all of the following are true:
  - ERR<STATUS.OF == 1
  - ERR<STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is W1C

PN, bit [22]
Poison.

- 0b0: Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
- 0b1: Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:
- Clearing ERR<STATUS.V to 0.
- Clearing both ERR<STATUS.{DE, UE} to 0.
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally Unknown value.

Accessing this field has the following behavior:

- Unknown/WI if any of the following are true:
  - $\text{ERR}_n\text{STATUS}.V == 0$
  - $\text{ERR}_n\text{STATUS}.DE == 0$ and \( \text{ERR}_n\text{STATUS}.UE == 0 \)
- RO if all of the following are true:
  - $\text{ERR}_n\text{STATUS}.DE == 0$
  - $\text{ERR}_n\text{STATUS}.UE == 0$
  - $\text{ERR}_n\text{STATUS}.CE != 0b00$
    - $\text{ERR}_n\text{STATUS}.CE$ is not being cleared to 0b00 in the same write
- RO if all of the following are true:
  - $\text{ERR}_n\text{STATUS}.UE == 0$
  - $\text{ERR}_n\text{STATUS}.DE != 0$
  - $\text{ERR}_n\text{STATUS}.DE$ is not being cleared to 0b0 in the same write
- RO if all of the following are true:
  - $\text{ERR}_n\text{STATUS}.UE != 0$
  - $\text{ERR}_n\text{STATUS}.UE$ is not being cleared to 0b0 in the same write
- Otherwise, access to this field is W1C

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

- 0b00 Uncorrected error, Uncontainable error (UC).
- 0b01 Uncorrected error, Unrecoverable error (UEU).
- 0b10 Uncorrected error, Latent or Restartable error (UEO).
- 0b11 Uncorrected error, Signaled or Recoverable error (UER).

--- Note ---

Software might use the information in the error record registers to determine what recovery is necessary.

---

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing $\text{ERR}_n\text{STATUS}.V$ to 0.
- Clearing $\text{ERR}_n\text{STATUS}.UE$ to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally Unknown value.

Accessing this field has the following behavior:

- Unknown/WI if any of the following are true:
  - $\text{ERR}_n\text{STATUS}.V == 0$
  - $\text{ERR}_n\text{STATUS}.UE == 0$
- RO if all of the following are true:
  - $\text{ERR}_n\text{STATUS}.DE == 0$
  - $\text{ERR}_n\text{STATUS}.UE == 0$
  - $\text{ERR}_n\text{STATUS}.CE != 0b00$
    - $\text{ERR}_n\text{STATUS}.CE$ is not being cleared to 0b00 in the same write
- RO if all of the following are true:
  - $\text{ERR}_n\text{STATUS}.UE == 0$
  - $\text{ERR}_n\text{STATUS}.DE != 0$
  - $\text{ERR}_n\text{STATUS}.DE$ is not being cleared to 0b0 in the same write
- RO if all of the following are true:
  - $\text{ERR}_n\text{STATUS}.UE != 0$
  - $\text{ERR}_n\text{STATUS}.UE$ is not being cleared to 0b0 in the same write
- Otherwise, access to this field is W1C
ERR<n>STATUS.DE is not being cleared to 0b0 in the same write

• RO if all of the following are true:
  — ERR<n>STATUS.DE != 0
  — ERR<n>STATUS.UE != 0
  — ERR<n>STATUS.UE is not being cleared to 0b0 in the same write

• Otherwise, access to this field is W1C

### Bits [19:16]
Reserved, RES0.

### IERR, bits [15:8]
IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

--- **Note** ---
This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• UNKNOWN/WI if all of the following are true:
  — the Common Fault Injection Model Extension is not implemented by the node that owns this error record
  — ERR<n>STATUS.V == 0

• UNKNOWN/WI if all of the following are true:
  — ERR<n>PFGF.SYN == 0
  — ERR<n>STATUS.V == 0

• RO if all of the following are true:
  — ERR<n>STATUS.DE == 0
  — ERR<n>STATUS.UE == 0
  — ERR<n>STATUS.CE != 0b00
  — ERR<n>STATUS.CE is not being cleared to 0b00 in the same write

• RO if all of the following are true:
  — ERR<n>STATUS.UE == 0
  — ERR<n>STATUS.DE != 0
  — ERR<n>STATUS.DE is not being cleared to 0b0 in the same write

• RO if all of the following are true:
  — ERR<n>STATUS.UE != 0
  — ERR<n>STATUS.UE is not being cleared to 0b0 in the same write

• Otherwise, access to this field is RW

### SERR, bits [7:0]
Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

0x00 No error.
0x01 IMPLEMENTATION DEFINED error.
0x02 Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03  IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04  Assertion failure. For example, consistency failure.
0x05  Error detected on internal data path. For example, parity on ALU result.
0x06  Data value from associative memory. For example, ECC error on cache data.
0x07  Address/control value from associative memory. For example, ECC error on cache tag.
0x08  Data value from a TLB. For example, ECC error on TLB data.
0x09  Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A  Data value from producer. For example, parity error on write data bus.
0x0B  Address/control value from producer. For example, parity error on address bus.
0x0C  Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D  Illegal address (software fault). For example, access to unpopulated memory.
0x0E  Illegal access (software fault). For example, byte write to word register.
0x0F  Illegal state (software fault). For example, device not ready.
0x10  Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11  Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12  Error response from Completer of access. For example, error response from cache write-back.
0x13  External timeout. For example, timeout on interaction with another component.
0x14  Internal timeout. For example, timeout on interface within the component.
0x15  Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16  Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17  Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18  Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19  Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A  Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

--- Note ---

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

---

The reset behavior of this field is:

* On a Cold reset, this field resets to an architecturally UNKNOWN value.
Accessing this field has the following behavior:

- **UNKNOWN/WI if all of the following are true:**
  - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
  - ERR<\text{n}>STATUS.V == 0

- **UNKNOWN/WI if all of the following are true:**
  - ERR<\text{q}>PFGF.SYN == 0
  - ERR<\text{n}>STATUS.V == 0

- **RO if all of the following are true:**
  - ERR<\text{n}>STATUS.DE == 0
  - ERR<\text{n}>STATUS.UE == 0
  - ERR<\text{n}>STATUS.CE != 0b00
  - ERR<\text{n}>STATUS.CE is not being cleared to 0b00 in the same write

- **RO if all of the following are true:**
  - ERR<\text{n}>STATUS.UE == 0
  - ERR<\text{n}>STATUS.DE != 0
  - ERR<\text{n}>STATUS.DE is not being cleared to 0b0 in the same write

- **RO if all of the following are true:**
  - ERR<\text{n}>STATUS.UE != 0
  - ERR<\text{n}>STATUS.UE is not being cleared to 0b0 in the same write

- **Otherwise, access to this field is RW**

**Accessing the ERR<\text{n}>STATUS:**

ERR<\text{n}>STATUS.\{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI\} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero.

ERR<\text{n}>STATUS.\{IERR, SERR\} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ERR<\text{n}>PFGF.SYN.

After reading ERR<\text{n}>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<\text{n}>STATUS.\{UE, DE, CE\} are ignored if ERR<\text{n}>STATUS.OF is 1 and is not being cleared to 0.

- Writes to ERR<\text{n}>STATUS.V are ignored if any of ERR<\text{n}>STATUS.\{UE, DE, CE\} are nonzero and are not being cleared to zero.

- Writes to ERR<\text{n}>STATUS.\{AV, MV\} and the ERR<\text{n}>STATUS.\{ER, PN, UET, IERR, SERR\} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<\text{n}>STATUS.UE, ERR<\text{n}>STATUS.DE, and ERR<\text{n}>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<\text{n}>STATUS.\{V, UE, OF, CE, DE\} are nonzero before the write.

- The write does not clear the nonzero ERR<\text{n}>STATUS.\{V, UE, OF, CE, DE\} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<\text{n}>STATUS are also defined as UNKNOWN where certain combinations of ERR<\text{n}>STATUS.\{V, DE, UE\} are zero. The rules for writes to ERR<\text{n}>STATUS allow a node to implement such a field as a fixed read-only value.
For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.
- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ERR<n>-PFGF.SYN.

ERR<n>STATUS can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x010 + (64 * n)</td>
<td>ERR&lt;n&gt;STATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ERR<n>STATUS.V != 0, ERR<n>STATUS.V is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.UE != 0, ERR<n>STATUS.UE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.OF != 0, ERR<n>STATUS.OF is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.CE != 0b00, ERR<n>STATUS.CE is not being cleared to 0b00 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.DE != 0, ERR<n>STATUS.DE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- Otherwise accesses to this register are RW.
I5.8.33 ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme on page K6-11696*.

**Configurations**

Implementation of this register is OPTIONAL.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR0 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:0</td>
<td>PART_0, Part number, bits [7:0].</td>
</tr>
</tbody>
</table>

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- **If a 12-bit part number is used**, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REV AND, available to define the revision of the component.

- **If a 16-bit part number is used**, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**Accessing the ERRPIDR0:**

ERRPIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE0</td>
<td>ERRPIDR0</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.8.34 ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme* on page K6-11696.

**Configurations**

Implementation of this register is OPTIONAL.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR1 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>31</th>
<th>24</th>
<th>17</th>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, JEPI06 identification code, bits [3:0]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEPI06 identification code for the designer of the component. The parity bit in the JEPI06 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

--- **Note** ---

For a component designed by Arm Limited, the JEPI06 identification code is 0x3B.

---

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**PART_1, bits [3:0]**

Part number, bits [11:8].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
Accessing the ERRPID1:

ERRPID1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE4</td>
<td>ERRPID1</td>

</table>

Accesses to this interface are RO.
I5.8.35 ERRPIDR2, Peripheral Identification Register 2

The ERRPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme on page K6-11696.

Configurations

Implementation of this register is OPTIONAL.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR2 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVISION</td>
<td>1</td>
<td>DES_1</td>
<td></td>
<td>JEDEC</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to 0b0000 when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x38.

This field has an IMPLEMENTATION DEFINED value.
When the component uses a 16-bit part number:

Bits [31:8]
Reserved, RES0.

PART_2, bits [7:4]
Part number, bits [15:12].
The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:
• If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REV AND, available to define the revision of the component.
• If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

JEDEC, bit [3]
JEDEC-assigned JEP106 implementer code is used.
Reads as 0b1.
Access to this field is RO.

DES_1, bits [2:0]
Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note
For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing the ERRPIDR2:

ERRPIDR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE8</td>

</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Component minor revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to 0b0000 when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**CMOD, bits [3:0]**

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
When the component uses a 16-bit part number:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVISION</td>
<td>CMOD</td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]
Reserved, RES0.

REVISION, bits [7:4]
Component revision. When a component is changed, ERRPIDR3.REVISION is increased to ensure that software can differentiate the different revisions of the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

CMOD, bits [3:0]
Customer Modified.
Indicates the component has been modified.
A value of 0b0000 means the component is not modified from the original design.
Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.
For any two components with the same Unique Component Identifier:
• If the value of the CMOD fields of both components equals zero, the components are identical.
• If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
• If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Accessing the ERRPIDR3:
ERRPIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFEC</td>
<td>ERRPIDR3</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
I5.8.37  ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme on page K6-11696.*

**Configurations**

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR4 is a 32-bit register.

**Field descriptions**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>27-8</td>
<td>SIZE</td>
</tr>
<tr>
<td>3-0</td>
<td>DES_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

--- Note ---

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.
Accessing the ERRPIDR4:

ERRPIDR4 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFD0</td>
<td>ERRPIDR4</td>
</tr>
</tbody>
</table>

Accesses to this interface are RO.
Part J

Architectural Pseudocode
Chapter J1
Armv8 Pseudocode

This chapter contains pseudocode that describes many features of the A-profile architecture. It contains the following sections:

- *Pseudocode for AArch64 operation* on page J1-11026.
- *Pseudocode for AArch32 operation* on page J1-11257.
- *Shared pseudocode* on page J1-11354.
J1.1 Pseudocode for AArch64 operation

This section holds the pseudocode for execution in AArch64 state. Functions that are listed in this section are identified as AArch64.FunctionName. Some of these functions have an equivalent AArch32 function, AArch32.FunctionName. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example aarch64/debug/breakpoint.

The top-level sections of the AArch64 pseudocode hierarchy are:

- aarch64/debug
- aarch64/exceptions on page J1-11050.
- aarch64/functions on page J1-11077.
- aarch64/instrs on page J1-11174.
- aarch64/translation on page J1-11212.

J1.1.1 aarch64/debug

This section includes the following pseudocode functions:

- aarch64/debug/brbe/BRBCycleCountingEnabled on page J1-11027.
- aarch64/debug/brbe/BRBEBranch on page J1-11027.
- aarch64/debug/brbe/BRBEBranchOnISB on page J1-11028.
- aarch64/debug/brbe/BRBEDebugStateExit on page J1-11028.
- aarch64/debug/brbe/BRBEEException on page J1-11028.
- aarch64/debug/brbe/BRBEEExceptionReturn on page J1-11030.
- aarch64/debug/brbe/BRBEFreeze on page J1-11030.
- aarch64/debug/brbe/BRBEJSB on page J1-11030.
- aarch64/debug/brbe/BRBEMispredictAllowed on page J1-11031.
- aarch64/debug/brbe/BRBETimeStamp on page J1-11031.
- aarch64/debug/brbe/BRB_IALL on page J1-11031.
- aarch64/debug/brbe/BRB_INJ on page J1-11032.
- aarch64/debug/brbe/Branch on page J1-11032.
- aarch64/debug/brbe/BranchEncCycleCount on page J1-11032.
- aarch64/debug/brbe/BranchMispredict on page J1-11032.
- aarch64/debug/brbe/BranchRawCycleCount on page J1-11032.
- aarch64/debug/brbe/BranchRecordAllowed on page J1-11032.
- aarch64/debug/brbe/Contents on page J1-11033.
- aarch64/debug/brbe/FilterBranchRecord on page J1-11033.
- aarch64/debug/brbe/FirstBranchAfterProhibited on page J1-11033.
- aarch64/debug/brbe/GetBRBENumRecords on page J1-11034.
- aarch64/debug/brbe/Getter on page J1-11034.
- aarch64/debug/brbe/ShouldBRBEFreeze on page J1-11034.
- aarch64/debug/brbe/UpdateBranchRecordBuffer on page J1-11035.
- aarch64/debug/breakpoint/AArch64.BreakpointMatch on page J1-11035.
- aarch64/debug/breakpoint/AArch64.BreakpointValueMatch on page J1-11036.
- aarch64/debug/breakpoint/AArch64.StateMatch on page J1-11037.
- aarch64/debug/enables/AArch64.GenerateDebugExceptions on page J1-11039.
- aarch64/debug/enables/AArch64.GenerateDebugExceptionsFrom on page J1-11039.
- aarch64/debug/pmu/AArch64.CheckForPMUOverflow on page J1-11039.
- aarch64/debug/pmu/AArch64.ClearEventCounters on page J1-11040.
- aarch64/debug/pmu/AArch64.CountPMUEvents on page J1-11040.
- aarch64/debug/pmu/AArch64.GetNumEventCountersAccessible on page J1-11042.
- aarch64/debug/pmu/AArch64.IncrementEventCounter on page J1-11042.
• aarch64/debug/pmud/AArch64.PMUCycle on page J1-11043.
• aarch64/debug/pmud/AArch64.PMUSwIncrement on page J1-11044.
• aarch64/debug/statisticalprofiling/CollectContextIDR1 on page J1-11044.
• aarch64/debug/statisticalprofiling/CollectContextIDR2 on page J1-11044.
• aarch64/debug/statisticalprofiling/CollectPhysicalAddress on page J1-11044.
• aarch64/debug/statisticalprofiling/CollectTimeStamp on page J1-11044.
