If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is
dependent on the general-purpose register written by this instruction might be significantly delayed.
C7.2.72 FCVTAU (vector)

Floating-point Convert to Unsigned integer, rounding to nearest with ties to Away (vector). This instruction converts each element in a vector from a floating-point value to an unsigned integer value using the Round to Nearest with Ties to Away rounding mode and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FPCRType fp cr = FPCR[];
bits(fltsize) fltval;
bits(intsize) intval;
fltval = V[n, fltsize];
intval = FPToFixed(fltval, 0, TRUE, fp cr, FPRounding_TIEAWAY, intsize);
X[d, intsize] = intval;
```

**Operational information**

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C7.2.74 FCVTL, FCVTL2

Floating-point Convert to higher precision Long (vector). This instruction reads each element in a vector in the SIMD&FP source register, converts each value to double the precision of the source element using the rounding mode that is determined by the FPCR, and writes each result to the equivalent element of the vector in the SIMD&FP destination register.

Where the operation lengthens a 64-bit vector to a 128-bit vector, the FCVTL2 variant operates on the elements in the top 64 bits of the source register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer n = UInt(Rn);

integer esize = 16 <<UInt(sz);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "sz" field. It can have the following values:

4S when sz = 0
2D when sz = 1

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

4H when sz = 0, Q = 0
8H when sz = 0, Q = 1
2S when sz = 1, Q = 0
4S when sz = 1, Q = 1
Operation

```c
CheckFPAAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part, datasize];
bits(2*datasize) result;

for e = 0 to elements-1
    Elem[result, e, 2*esize] = FPConvert(Elem[operand, e, esize], FPCR[], 2 * esize);

V[d, 2*datasize] = result;
```
C7.2.75   FCVTMS (vector)

Floating-point Convert to Signed integer, rounding toward Minus infinity (vector). This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round towards Minus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<V> Is a width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
- D when sz = 1
</d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
</n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
</Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
</T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
- 8H when Q = 1
For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1
The encoding sz = 1, Q = 0 is reserved.
</Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];

bits(esize) element;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d, 128] else Zeros(128);

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, fpcr, rounding, esize);
V[d, 128] = result;
```
C7.2.78 FCVTMU (scalar)

Floating-point Convert to Unsigned integer, rounding toward Minus infinity (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round towards Minus Infinity rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Half-precision to 32-bit variant

Applies when \( sf == 0 \) && \( ftype == 11 \).

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is
dependent on the general-purpose register written by this instruction might be significantly delayed.
C7.2.79 FCVTN, FCVTN2

Floating-point Convert to lower precision Narrow (vector). This instruction reads each vector element in the SIMD&FP source register, converts each result to half the precision of the source element, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The rounding mode is determined by the FPCR.

The FCVTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the FCVTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

**Operational information**

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C7.2.84 FCVTPS (vector)

Floating-point Convert to Signed integer, rounding toward Plus infinity (vector). This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round towards Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

CheckFPEnabled64();

FPCRTyp e fpcr = FPCR[];
bits(fltsize) fltval;
bits(intsize) intval;
fltval = V[n, fltsize];
intval = FPToFixed(fltval, 0, TRUE, fpcr, rounding, intsize);
X[d, intsize] = intval;

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C7.2.88 FCVTXN, FCVTXN2

Floating-point Convert to lower precision Narrow, rounding to odd (vector). This instruction reads each vector element in the source SIMD&FP register, narrows each value to half the precision of the source element using the Round to Odd rounding mode, writes the result to a vector, and writes the vector to the destination SIMD&FP register.

Note

This instruction uses the Round to Odd rounding mode which is not defined by the IEEE 754-2008 standard. This rounding mode ensures that if the result of the conversion is inexact the least significant bit of the mantissa is forced to 1. This rounding mode enables a floating-point value to be converted to a lower precision format via an intermediate precision format while avoiding double rounding errors. For example, a 64-bit floating-point value can be converted to a correctly rounded 16-bit floating-point value by first using this instruction to produce a 32-bit value and then using another instruction with the wanted rounding mode to convert the 32-bit value to the final 16-bit floating-point value.

The FCVTXN instruction writes the vector to the lower half of the destination register and clears the upper half, while the FCVTXN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.89   FCVTZS (vector, fixed-point)

Floating-point Convert to Signed fixed-point, rounding toward Zero (vector). This instruction converts a scalar or each element in a vector from floating-point to fixed-point signed integer using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Assembler symbols

\(<V>\) Is a width specifier, encoded in the "immh" field. It can have the following values:
H when immh = 001x
S when immh = 01xx
D when immh = 1xxx
The encoding immh = 000x is reserved.

\(<d>\) Is the number of the SIMD&FP destination register, in the "Rd" field.

\(<n>\) Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

\(<Vd>\) Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\(<T>\) Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1
2D when immh = 1xxx, Q = 1
See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.
The following encodings are reserved:
• immh = 0001, Q = x.
• immh = 1xxx, Q = 0.

\(<Vn>\) Is the name of the SIMD&FP source register, encoded in the "Rn" field.

\(<fbits>\) For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded
in the "immh:immb" field. It can have the following values:
(32-Uint(immh:immb)) when immh = 001x
(64-Uint(immh:immb)) when immh = 01xx
(128-Uint(immh:immb)) when immh = 1xxx
The encoding immh = 000x is reserved.
For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded
in the "immh:immb" field. It can have the following values:
(32-Uint(immh:immb)) when immh = 001x
(64-Uint(immh:immb)) when immh = 01xx
(128-Uint(immh:immb)) when immh = 1xxx
See Advanced SIMD modified immediate on page C4-632 when immh = 0000.
The encoding immh = 0001 is reserved.

**Assembler symbols**

<hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<V> Is a width specifier, encoded in the "sz" field. It can have the following values:
S when sz = 0
D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
4H when Q = 0
8H when Q = 1
For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
b整数(datasize) operand = V[n, datasize];

整数(esize) element;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
b整数(128) result = if merge then V[d, 128] else Zeros(128);

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, fpcr, rounding, esize);
V[d, 128] = result;
```
C7.2.95 FCVTZU (scalar, fixed-point)

Floating-point Convert to Unsigned fixed-point, rounding toward Zero (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit fixed-point unsigned integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

V[d, 128] = result;
```
C7.2.99 FJCVTZS

Floating-point Javascript Convert to Signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register. If the result is too large to be represented as a signed 32-bit integer, then the result is the integer modulo $2^{32}$, as held in a 32-bit signed integer.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Single-precision and double-precision

Encoding
FMAX <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean pair = (U == '1');
boolean minimum = (O1 == '1');

**Assembler symbols**

\(<V_d>\) Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\(<T>\) For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- 4H when Q = 0
- 8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

\(<V_n>\) Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\(<V_m>\) Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation for all encodings**

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;
for e = 0 to elements-1

    element1 = Elem[concat, 2*e, esize];
    element2 = Elem[concat, (2*e)+1, esize];
  else
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];

  if minimum then
    Elem[result, e, esize] = FPMin(element1, element2, FPCR[]);
  else
    Elem[result, e, esize] = FPMax(element1, element2, FPCR[]);
V[d, datasize] = result;
C7.2.102  FMAX (scalar)

Floating-point Maximum (scalar). This instruction compares the two source SIMD&FP registers, and writes the larger of the two floating-point values to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant
Applies when ftype == 11.
FMAX <Hd>, <Hn>, <Hm>

Single-precision variant
Applies when ftype == 00.
FMAX <Sd>, <Sn>, <Sm>

Double-precision variant
Applies when ftype == 01.
FMAX <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
  when '00' esize = 32;
  when '01' esize = 64;
  when '10' UNDEFINED;
  when '11'
    if HaveFP16Ext() then
      esize = 16;
    else
      UNDEFINED;

Assembler symbols

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sd> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPEnabled64();
bits(esize) operand1 = V[n, esize];
bits(esize) operand2 = V[m, esize];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n, 128] else Zeros(128);

Elem[result, 0, esize] = FPMax(operand1, operand2, fpcr);
V[d, 128] = result;
```
C7.2.103  **FMAXNM (vector)**

Floating-point Maximum Number (vector). This instruction compares corresponding vector elements in the two source SIMD&FP registers, writes the larger of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result placed in the vector is the numerical value, otherwise the result is identical to FMAX (scalar).

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Half-precision

Assembler symbols

\(<V>\) For the half-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
\(H\) when \(sz = 0\)
The encoding \(sz = 1\) is reserved.

For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
\(S\) when \(sz = 0\)
\(D\) when \(sz = 1\)

\(<d>\) Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

\(<Vn>\) Is the name of the SIMD&FP source register, encoded in the "Rn" field.

\(<T>\) For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
\(2H\) when \(sz = 0\)
The encoding \(sz = 1\) is reserved.

For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
\(2S\) when \(sz = 0\)
\(2D\) when \(sz = 1\)

Operation for all encodings

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];

V[d, esize] = Reduce(ReduceOp_FMAX, operand, esize);
```
C7.2.109 FMAXP (vector)

Floating-point Maximum Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, writes the larger of each pair of values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

\(<T>\)  
For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

- 2H  when \( sz = 0 \)
- The encoding \( sz = 1 \) is reserved.

For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

- 2S  when \( sz = 0 \)
- 2D  when \( sz = 1 \)

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
V[d, esize] = Reduce(ReduceOp_PMINNUM, operand, esize, FALSE);
```
C7.2.116   **FMINNMP (vector)**

Floating-point Minimum Number Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the smallest of each pair of floating-point values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value, otherwise the result is identical to FMIN (scalar).

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps* on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.125  **FMLS (by element)**

Floating-point fused Multiply-Subtract from accumulator (by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and subtracts the results from the vector elements of the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  integer d = UInt(Rd);
  integer n = UInt(Rn);
  integer m = UInt('0':Rm);    // Vm can only be in bottom 16 registers.
  if sz == '1' then UNDEFINED;
  integer index = UInt(H:L:M);

  integer esize = 32;
  integer datasize = if Q == '1' then 128 else 64;
  integer elements = datasize DIV esize;

  boolean sub_op = (S == '1');
  integer part = 0;

FMLSL2

(FEAT_FHM)

Encoding

FMLSL2 <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.H[<index>]
Decode for this encoding

if ![HaveFP16MulNoRoundingToFP32Ext() then UNDEFINED;]
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt('0':Rm); // Vm can only be in bottom 16 registers.
if sz == '1' then UNDEFINED;
integer index = UInt(H:L:M); 

integer esize = 32;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean sub_op = (S == '1');
integer part = 1;

Assembler symbols

<\Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
2S when Q = 0
4S when Q = 1

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
2H when Q = 0
4H when Q = 1

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

<index> Is the element index, encoded in the "H:L:M" fields.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(datasize DIV 2) operand1 = Vpart[n, part, datasize DIV 2];
bits(128) operand2 = V[m, 128];
bits(datasize) operand3 = V[d, datasize];
bits(datasize) result;
bits(esize DIV 2) element1;
bits(esize DIV 2) element2 = Elem[operand2, index, esize DIV 2];

for e = 0 to elements-1
  element1 = Elem[operand1, e, esize DIV 2];
  if sub_op then element1 = FPNeg(element1);
  Elem[result, e, esize] = FPMulAddH(Elem[operand3, e, esize], element1, element2, FPCR[]);
V[d, datasize] = result;
C7.2.128 FMLSL, FMLSL2 (vector)

Floating-point fused Multiply-Subtract Long from accumulator (vector). This instruction negates the values in the vector of one SIMD&FP register, multiplies these with the corresponding values in another vector, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_AA64ISAR0_EL1.FH indicates whether this instruction is supported.

Elem[result, 0, esize] = FPMulAdd(operand, operand1, operand2, fpcr);
V[d, 128] = result;
```
C7.2.134  FMUL (by element)

Floating-point Multiply (by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:
    S when sz = 0
    D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
    4H when Q = 0
    8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:
    2S when Q = 0, sz = 0
    4S when Q = 1, sz = 0
    2D when Q = 1, sz = 1

The encoding Q = 0, sz = 1 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> For the half-precision variant: is the name of the second SIMD&FP source register, in the range V0 to V15, encoded in the "Rm" field.
For the single-precision and double-precision variant: is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<Ts> Is an element size specifier, encoded in the "sz" field. It can have the following values:
    S when sz = 0
    D when sz = 1

<index> For the half-precision variant: is the element index, in the range 0 to 7, encoded in the "H:L:M" fields.
For the single-precision and double-precision variant: is the element index, encoded in the "sz:L:H" field. It can have the following values:
    H:L when sz = 0, L = x
    H when sz = 1, L = 0

The encoding sz = 1, L = 1 is reserved.

C7.2.135   FMUL (vector)

Floating-point Multiply (vector). This instruction multiplies corresponding floating-point values in the vectors in the two source SIMD&FP registers, places the result in a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

- `<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- `<Hd>` Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPEnabled64();
bits(esize) operand1 = V[n, esize];
basis(esize) operand2 = V[m, esize];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
basis(128) result = if merge then V[n, 128] else Zeros(128);

bits(esize) product = FPMul(operand1, operand2, fpcr);
Elem[result, 0, esize] = product;
V[d, 128] = result;
```
C7.2.137   **FMULX (by element)**

Floating-point Multiply extended (by element). This instruction multiplies the floating-point values in the vector elements in the first source SIMD&FP register by the specified floating-point value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If one value is zero and the other value is infinite, the result is 2.0. In this case, the result is negative if only one of the values is negative, otherwise the result is positive.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps* on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

| Rn | Rd |

**Encoding**

FNEG <Vd>.<T>, <Vn>.<T>

**Decode for this encoding**

```c
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then UNDEFINED;

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

**Assembler symbols**

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- 4H when Q = 0
- 8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    if neg then
        element = FPNeg(element);
    else
        element = FPAbs(element);
    Elem[result, e, esize] = element;
V[d, datasize] = result;
```
C7.2.140   FNEG (scalar)

Floating-point Negate (scalar). This instruction negates the value in the SIMD&FP source register and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant
Applies when $ftype == 11$.
FNEG $<Hd>$, $<Hn>$

Single-precision variant
Applies when $ftype == 00$.
FNEG $<Sd>$, $<Sn>$

Double-precision variant
Applies when $ftype == 01$.
FNEG $<Dd>$, $<Dn>$

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
  case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
      if HaveFP16Ext() then
        esize = 16;
      else
        UNDEFINED;
  end;
```

Assembler symbols

- $<Dd>$ Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- $<Dn>$ Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- $<Hd>$ Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

**Encoding**

FRECPX <V><d>, <V><n>

**Decode for this encoding**

integer d = UInt(Rd);
integer n = UInt(Rn);
integer esize = 32 << UInt(sz);

**Assembler symbols**

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

- 5 when sz = 0
D when $sz = 1$

$d$ is the number of the SIMD&FP destination register, encoded in the "Rd" field.

$n$ is the number of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
CheckFPEnabled64();
bits(esize) operand = V[n, esize];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[d, 128] else Zeros(128);

Elem[result, 0, esize] = FPRecpX(operand, fpcr);

V[d, 128] = result;
```
C7.2.147 FRINT32X (vector)

Floating-point Round to 32-bit Integer, using current rounding mode (vector). This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values that fit into a 32-bit integer size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

A zero input returns a zero result with the same sign. When one of the result values is not numerically equal to the corresponding input value, an Inexact exception is raised. When an input is infinite, NaN or out-of-range, the instruction returns for the corresponding result value the most negative integer representable in the destination size, and an Invalid Operation floating-point exception is raised.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  when '111' rounding = FPRoundingMode(FPCR[]);
```

Assembler symbols

- `<Vd>`: Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>`: For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  - 4H when Q = 0
  - 8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

- `<Vn>`: Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
  element = Elem[operand, e, esize];
  Elem[result, e, esize] = FPRoundInt(element, FPCR[], rounding, exact);

V[d, datasize] = result;
```
C7.2.156 FRINTA (scalar)

Floating-point Round to Integral, to nearest with ties to Away (scalar). This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value of the same size using the Round to Nearest with Ties to Away rounding mode, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FRINTA <Hd>, <Hn>

Single-precision variant

Applies when ftype == 00.

FRINTA <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FRINTA <Dd>, <Dn>

Decode for all variants of this encoding

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
   case ftype of
      when '00' esize = 32;

      when '10' UNDEFINED;
      when '11'
         if HaveFP16Ext() then
            esize = 16;
         else
            UNDEFINED;
   end
```

Assembler symbols

- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Dn>` Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- `<Hd>` Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation**

```
CheckFPEnabled64();
FPCRType fp = FPCR[];
boolean merge = IsMerging(fp);
bits(128) result = if merge then V[d, 128] else Zeros(128);
bits(esize) operand = V[n, esize];

Elem[result, 0, esize] = FPATInt(operand, fp, FPRounding_TIEAWAY, FALSE);
V[d, 128] = result;
```
C7.2.157  FRINTI (vector)

Floating-point Round to Integral, using current rounding mode (vector). This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value of the same size using the Round to Nearest rounding mode, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FRINTN <Hd>, <Hn>

Single-precision variant

Applies when ftype == 00.

FRINTN <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FRINTN <Dd>, <Dn>

Decode for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
case ftype of
when '00' esize = 32;
when '01' esize = 64;
when '10' UNDEFINED;
when '11'
if HaveFP16Ext() then

FPRounding rounding;
rounding = FPDecodeRounding('00');

Assembler symbols

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation**

```java
CheckFPEnabled64();

FPCRTyperefcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[d, 128] else Zeros(128);
bits(esize) operand = V[n, esize];

Elem[result, 0, esize] = FPRoundInt(operand, fpcr, rounding, FALSE);
V[d, 128] = result;
```
C7.2.163 FRINTP (vector)

Floating-point Round to Integral, toward Plus infinity (vector). This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the Round towards Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Elem[result, 0, esize] = FPRoundInt(operand, fpcr, rounding, FALSE);
V[d, 128] = result;
```
C7.2.165  FRINTX (vector)

Floating-point Round to Integral exact, using current rounding mode (vector). This instruction rounds a vector of
floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the
rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

When a result value is not numerically equal to the corresponding input value, an Inexact exception is raised. A zero
input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN
is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception
results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state
and Exception level, an attempt to execute the instruction might be trapped.

Vector single-precision and double-precision

Assembler symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<V> Is a width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0
D when sz = 1

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0
8H when Q = 1
For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1
The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
if elements == 1 then
    CheckFPEnabled64();
else
    CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];

bits(esize) element;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d, 128] else Zeros(128);
for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRSqrtEstimate(element, fpcr);
V[d, 128] = result;
```
C7.2.170   FRSQRTS

Floating-point Reciprocal Square Root Step. This instruction multiplies corresponding floating-point values in the vectors of the two source SIMD&FP registers, subtracts each of the products from 3.0, divides these results by 2.0, places the results into a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar half precision

(Feat_FP16)

```c
integer d = UInt(Rd);
integer n = UInt(Rn);

d =UInt(Rd);
integer esize;
case ftype of
  when '00' esize = 32;
  when '01' esize = 64;
  when '10' UNDEFINED;
  when '11'
    if HaveFP16Ext() then
      esize = 16;
    else
      UNDEFINED;

Assembler symbols

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Dr> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hr> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation**

```c
CheckFPEnabled64();

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
b启迪(128) result = if merge then V[d, 128] else 0x127:0;

bits(esize) operand = V[n, esize];

Elem[result, 0, esize] = FPSqrt(operand, fpcr);

V[d, 128] = result;
```
C7.2.173  FSUB (vector)

Floating-point Subtract (vector). This instruction subtracts the elements in the vector in the second source SIMD&FP register, from the corresponding elements in the vector in the first source SIMD&FP register, places each result into elements of a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

</table>
```

Decode for this encoding

```python
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;

integer dst_index = UInt(imm5<4:size+1>);
integer src_index = UInt(imm4<3:size>);
integer index_size = if imm4<3> == '1' then 128 else 64;
// imm4<size-1:0> is IGNORED

integer esize = 8 << size;
```

Assembler symbols

- `<Vd>`: Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Ts>`: Is an element size specifier, encoded in the "imm5" field. It can have the following values:
  - `B` when imm5 = xxxx1
  - `H` when imm5 = xxx10
  - `S` when imm5 = xx100
  - `D` when imm5 = x1000
  - The encoding imm5 = x0000 is reserved.
- `<index1>`: Is the destination element index encoded in the "imm5" field. It can have the following values:
  - imm5<4:1> when imm5 = xxxx1
  - imm5<4:2> when imm5 = xxx10
  - imm5<4:3> when imm5 = xx100
  - imm5<4> when imm5 = x1000
  - The encoding imm5 = x0000 is reserved.
- `<Vn>`: Is the name of the SIMD&FP source register, encoded in the "Rn" field.
Is the source element index encoded in the "imm5:imm4" field. It can have the following values:

- imm4<3:0> when imm5 = xxxx1
- imm4<3:1> when imm5 = xxx10
- imm4<3:2> when imm5 = xx100
- imm4<3> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(idxdsize) operand = V[n, idxdsize];
bits(128) result;
result = V[d, 128];
Elem[result, dst_index, esize] = Elem[operand, src_index, esize];
V[d, 128] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.176   INS (general)

Insert vector element from general-purpose register. This instruction copies the contents of the source general-purpose register to the specified vector element in the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (from general). The alias is always the preferred disassembly.

Encoding

INS <Vd>.<Ts>[<index>], <R><n>

Decode for this encoding

```plaintext
data = UInt(Rd);
n = UInt(Rn);
size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;
index = UInt(imm5<4:size+1>);
esize = 8 << size;
```

Assembler symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Ts>` Is an element size specifier, encoded in the "imm5" field. It can have the following values:
  - B when imm5 = xxxx1
  - H when imm5 = xxx10
  - S when imm5 = xx100
  - D when imm5 = x1000
  The encoding imm5 = x0000 is reserved.
- `<index>` Is the element index encoded in the "imm5" field. It can have the following values:
  - imm5<4:1> when imm5 = xxxx1
  - imm5<4:2> when imm5 = xxx10
  - imm5<4:3> when imm5 = xx100
  - imm5<4> when imm5 = x1000
  The encoding imm5 = x0000 is reserved.
- `<R>` Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:
  - W when imm5 = xxxx1
W when imm5 = xxx10
W when imm5 = xx100
X when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(esize) element = X[n, esize];
bits(128) result;

result = V[d, 128];
Elem[result, index, esize] = element;
V[d, 128] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.177   LD1 (multiple structures)

Load multiple single-element structures to one, two, three, or four registers. This instruction loads multiple single-element structures from memory and writes the result to one, two, three, or four SIMD&FP registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**No offset**

![Instruction Format](image)

**One register variant**
Applies when opcode == 0111.

LD1 { <Vt>.<T> }, [<Xn|SP>]

**Two registers variant**
Applies when opcode == 1010.

LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]

**Three registers variant**
Applies when opcode == 0110.

LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]

**Four registers variant**
Applies when opcode == 0010.

LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]

**Decode for all variants of this encoding**

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;

**Post-index**

![Instruction Format](image)

**One register, immediate offset variant**
Applies when Rm == 11111 && opcode == 0111.

LD1 { <Vt>.<T> }, [Xn], <imm>

**One register, register offset variant**
Applies when Rm != 11111 && opcode == 0111.
LD1 { <Vt>.<T> }, [<Xn|SP>], <Xm>

**Two registers, immediate offset variant**
Applies when Rm == 11111 && opcode == 1010.
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>

**Two registers, register offset variant**
Applies when Rm != 11111 && opcode == 1010.
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>

**Three registers, immediate offset variant**
Applies when Rm == 11111 && opcode == 0110.
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>

**Three registers, register offset variant**
Applies when Rm != 11111 && opcode == 0110.
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>

**Four registers, immediate offset variant**
Applies when Rm == 11111 && opcode == 0010.
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>

**Four registers, register offset variant**
Applies when Rm != 11111 && opcode == 0010.
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>

**Decode for all variants of this encoding**
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;

**Assembler symbols**

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 1D when size = 11, Q = 0
- 2D when size = 11, Q = 1

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<\textit{vt3}> is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<\textit{vt4}> is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<\textit{Xn}\mid SP> is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<\textit{imm}> For the one register, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

\begin{align*}
\#8 & \quad \text{when } Q = 0 \\
\#16 & \quad \text{when } Q = 1
\end{align*}

For the two registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

\begin{align*}
\#16 & \quad \text{when } Q = 0 \\
\#32 & \quad \text{when } Q = 1
\end{align*}

For the three registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

\begin{align*}
\#24 & \quad \text{when } Q = 0 \\
\#48 & \quad \text{when } Q = 1
\end{align*}

For the four registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:

\begin{align*}
\#32 & \quad \text{when } Q = 0 \\
\#64 & \quad \text{when } Q = 1
\end{align*}

<\textit{Xm}> is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

**Shared decode for all encodings**

\begin{verbatim}
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;
integer rpt;    // number of iterations
integer selem;    // structure elements

case opcode of
    when '0000' rpt = 1; selem = 4;    // LD/ST4 (4 registers)
    when '0010' rpt = 4; selem = 1;    // LD/ST1 (4 registers)
    when '0100' rpt = 1; selem = 3;    // LD/ST3 (3 registers)
    when '0110' rpt = 3; selem = 1;    // LD/ST1 (3 registers)
    when '0111' rpt = 1; selem = 1;    // LD/ST1 (1 register)
    when '1000' rpt = 1; selem = 2;    // LD/ST2 (2 registers)
    when '1010' rpt = 2; selem = 1;    // LD/ST1 (2 registers)
otherwise UNDEFINED;

// .1D format only permitted with LD1 & ST1
if size:Q == '110' && selem != 1 then UNDEFINED;
\end{verbatim}

**Operation for all encodings**

Operational information
If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.180 LD2 (multiple structures)

Load multiple 2-element structures to two registers. This instruction loads multiple 2-element structures from memory and writes the result to the two SIMD&FP registers, with de-interleaving.

For an example of de-interleaving, see LD3 (multiple structures).

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Operational information**

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
**C7.2.181 LD2 (single structure)**

Load single 2-element structure to one lane of two registers. This instruction loads a 2-element structure from memory and writes the result to the corresponding elements of the two SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**No offset**

```
[31 30 29 28][27 26 25 24][23 22 21 20][19 18 17 16][15 13 12][11 10 9] | 5 4 | 0 |

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.184   LD3 (single structure)

Load single 3-element structure to one lane of three registers. This instruction loads a 3-element structure from memory and writes the result to the corresponding elements of the three SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

[<index>], [<Xn|SP>]

8-bit variant

Applies when opcode == 001.

16-bit variant

Applies when opcode == 011 && size == x0.

LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>]

32-bit variant

Applies when opcode == 101 && size == 00.

64-bit variant

Applies when opcode == 101 && S == 0 && size == 01.

LD3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>]

Decode for all variants of this encoding

integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

- `<Vt>` Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

  - 88 when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
1D when size = 11, Q = 0
2D when size = 11, Q = 1

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm> Is the post-index immediate offset, encoded in the "size" field. It can have the following values:
#4 when size = 00
#8 when size = 01
#16 when size = 10
#32 when size = 11
<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

        X[n, 64] = address + offs;

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.189  LDNP (SIMD&FP)

Load Pair of SIMD&FP registers, with Non-temporal hint. This instruction loads a pair of SIMD&FP registers from memory, issuing a hint to the memory system that the access is non-temporal. The address that is used for the load is calculated from a base register value and an optional immediate offset.

For information about non-temporal pair instructions, see Load/store SIMD and floating-point non-temporal pair on page C3-265.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### 32-bit variant

- `<Xn|SP>`: Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<simm>`: Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field.
- `<pimm>`: For the 8-bit variant: is the optional positive immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For the 16-bit variant: is the optional positive immediate byte offset, a multiple of 2 in the range 0 to 8190, defaulting to 0 and encoded in the "imm12" field as `<pimm>/2`.

For the 32-bit variant: is the optional positive immediate byte offset, a multiple of 4 in the range 0 to 16380, defaulting to 0 and encoded in the "imm12" field as `<pimm>/4`.

For the 64-bit variant: is the optional positive immediate byte offset, a multiple of 8 in the range 0 to 32760, defaulting to 0 and encoded in the "imm12" field as `<pimm>/8`.

For the 128-bit variant: is the optional positive immediate byte offset, a multiple of 16 in the range 0 to 65520, defaulting to 0 and encoded in the "imm12" field as `<pimm>/16`.

### Shared decode for all encodings

```plaintext
integer n = UInt(Rn);
integer t = UInt(Rt);
MemOp memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = 8 << scale;
boolean tag_checked = memop != MemOp_PREFETCH && (wback || n != 31);
```

### Operation for all encodings

```plaintext
CheckFPEnable64();
bits(64) address;
bits(datasize) data;
```
if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n, 64];

if !postindex then
    address = address + offset;

case memop of
    when MemOp_STORE
        data = V[t, datasize];
        Mem[address, datasize DIV 8, AccType_VEC] = data;
    when MemOp_LOAD
        data = Mem[address, datasize DIV 8, AccType_VEC];
        V[t, datasize] = data;

    if wback then
        if postindex then
            address = address + offset;
        if n == 31 then
            SP[] = address;
        else
            X[n, 64] = address;

**Operational information**

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.192  LDR (literal, SIMD&FP)

Load SIMD&FP Register (PC-relative literal). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from the PC value and an immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit variant

Applies when \( \text{opc} == 00 \).

\[
\text{LDR} \; \text{<St>}, \; \text{<label>}
\]

64-bit variant

Applies when \( \text{opc} == 01 \).

\[
\text{LDR} \; \text{<Dt>}, \; \text{<label>}
\]

128-bit variant

Applies when \( \text{opc} == 10 \).

\[
\text{LDR} \; \text{<Qt>}, \; \text{<label>}
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } t &= \text{UInt}(\text{Rt}); \\
\text{integer } \text{size} &= \text{bits}(64) \text{ offset}; \\
\text{case } \text{opc} \text{ of} \\
& \quad \text{when } '00' \\
& \quad \quad \text{size} = 4; \\
& \quad \text{when } '01' \\
& \quad \quad \text{size} = 8; \\
& \quad \text{when } '10' \\
& \quad \quad \text{size} = 16; \\
& \quad \text{when } '11' \\
& \quad \quad \text{UNDEFINED}; \\
\text{offset} &= \text{SignExtend}(\text{imm19}:'00', 64);
\end{align*}
\]

Assembler symbols

- \( \text{<Dt>} \) Is the 64-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- \( \text{<Qt>} \) Is the 128-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- \( \text{<St>} \) Is the 32-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- \( \text{<label>} \) Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.
Operation

bits(64) address = PC[] + offset;
bits(size=8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(FALSE);
CheckFPEnabled64();

data = Mem[address, size, AccType_VEC];
V[t, size=8] = data;

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.193  **LDR (register, SIMD&FP)**

Load SIMD&FP Register (register offset). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Decode for all variants of this encoding

```c
integer scale = UInt(opc<1>:size);
if scale > 4 then UNDEFINED;
if option<1> == '0' then UNDEFINED;  // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

### Assembler symbols

- **<Bt>** is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt>
Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<ht>
Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Qt>
Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<St>
Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Xn|SP>
Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm>
When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

<extend>
For the 8-bit variant: is the index extend specifier, encoded in the "option" field. It can have the following values:

UXTW when option = 010
SXTW when option = 110
SXTX when option = 111

For the 128-bit, 16-bit, 32-bit and 64-bit variant: is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

UXTW when option = 010
LSL when option = 011
SXTW when option = 110
SXTX when option = 111

<amount>
For the 8-bit variant: is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

For the 16-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0
#1 when S = 1

For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0
#2 when S = 1

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0
#3 when S = 1

For the 128-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0
#4 when S = 1
Shared decode for all encodings

        4S when size = 10, Q = 1
        The encoding size = 11, Q = x is reserved.
<Vn>    Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>    Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) operand3 = V[d, datasize];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;
for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    product = (UInt(element1)*UInt(element2))<esize-1:0>;
    if sub_op then
        Elem[result, e, esize] = Elem[operand3, e, esize] - product;
    else
        Elem[result, e, esize] = Elem[operand3, e, esize] + product;
V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.199 MOV (scalar)

Move vector element to scalar. This instruction duplicates the specified vector element in the SIMD&FP source register into a scalar, and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the DUP (element) instruction. This means that:

- The encodings in this description are named to match the encodings of DUP (element).
- The description of DUP (element) gives the operational pseudocode for this instruction.

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
\hline
0 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & Rn & Rd \\
\hline
\end{array}
\]

**Encoding**

MOV <V><d>, <Vn>.<T>[<index>]

is equivalent to

DUP <V><d>, <Vn>.<T>[<index>]

and is always the preferred disassembly.

**Assembler symbols**

- **<V>** Is the destination width specifier, encoded in the "imm5" field. It can have the following values:
  - B when \( imm5 = xxxx1 \)
  - H when \( imm5 = xxx10 \)
  - S when \( imm5 = xx100 \)
  - D when \( imm5 = x1000 \)
  - The encoding \( imm5 = x0000 \) is reserved.

- **<d>** Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

- **<Vn>** Is the name of the SIMD&FP source register, encoded in the "Rn" field.

- **<T>** Is the element width specifier, encoded in the "imm5" field. It can have the following values:
  - B when \( imm5 = xxxx1 \)
  - H when \( imm5 = xxx10 \)
  - S when \( imm5 = xx100 \)
  - D when \( imm5 = x1000 \)
  - The encoding \( imm5 = x0000 \) is reserved.

- **<index>** Is the element index encoded in the "imm5" field. It can have the following values:
  - \( imm5<4:1> \) when \( imm5 = xxxx1 \)
  - \( imm5<4:2> \) when \( imm5 = xxx10 \)
  - \( imm5<4:3> \) when \( imm5 = xx100 \)
  - \( imm5<4> \) when \( imm5 = x1000 \)
  - The encoding \( imm5 = x0000 \) is reserved.
Operation

The description of DUP (element) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.200 MOV (element)

Move vector element to another vector element. This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the INS (element) instruction. This means that:

- The encodings in this description are named to match the encodings of INS (element).
- The description of INS (element) gives the operational pseudocode for this instruction.

```
Encoding
MOV <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

is equivalent to

```
INS <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

and is always the preferred disassembly.

**Assembler symbols**

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Ts>` Is an element size specifier, encoded in the "imm5" field. It can have the following values:
  - `B` when `imm5 = xxxx1`
  - `H` when `imm5 = xxx10`
  - `S` when `imm5 = xx100`
  - `D` when `imm5 = x1000`
    The encoding `imm5 = x0000` is reserved.
- `<index1>` Is the destination element index encoded in the "imm5" field. It can have the following values:
  - `imm5<4:1>` when `imm5 = xxxx1`
  - `imm5<4:2>` when `imm5 = xxx10`
  - `imm5<4:3>` when `imm5 = xx100`
  - `imm5<4>` when `imm5 = x1000`
    The encoding `imm5 = x0000` is reserved.
- `<Vn>` Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- `<index2>` Is the source element index encoded in the "imm5:imm4" field. It can have the following values:
  - `imm4<3:0>` when `imm5 = xxxx1`
  - `imm4<3:1>` when `imm5 = xxx10`
  - `imm4<3:2>` when `imm5 = xx100`
imm<4:3> when imm5 = x1000
The encoding imm5 = x0000 is reserved.
Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

**Operation**

The description of INS (element) gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.201 MOV (from general)

Move general-purpose register to a vector element. This instruction copies the contents of the source
general-purpose register to the specified vector element in the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining
bits to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state
and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the INS (general) instruction. This means that:

• The encodings in this description are named to match the encodings of INS (general).

• The description of INS (general) gives the operational pseudocode for this instruction.

Encoding

MOV <Vd>.<Ts>[<index>], <R><n>

is equivalent to

INS <Vd>.<Ts>[<index>], <R><n>

and is always the preferred disassembly.

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

B    when imm5 = xxxx1
H    when imm5 = xxx10
S    when imm5 = xx100
D    when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<index> Is the element index encoded in the "imm5" field. It can have the following values:

imm5<4:1>    when imm5 = xxxx1
imm5<4:2>    when imm5 = xxx10
imm5<4:3>    when imm5 = xx100
imm5<4>      when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

W    when imm5 = xxxx1
W    when imm5 = xxx10
W    when imm5 = xx100
X    when imm5 = x1000
The encoding \( \text{imm5} = \text{x0000} \) is reserved.

\(<n>\) Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

**Operation**

The description of INS (general) gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.202 MOV (vector)

Move vector. This instruction copies the vector in the source SIMD&FP register into the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the ORR (vector, register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (vector, register).
- The description of ORR (vector, register) gives the operational pseudocode for this instruction.

\[
\begin{array}{c|c|c}
\text{Encoding} & \text{Operation} & \text{Assembler symbols} \\
\end{array}
\]

| MOV <Vd>.<T>, <Vn>.<T> | ORR <Vd>.<T>, <Vn>.<T>, <Vn>.<T> | Rd |

and is the preferred disassembly when \( Rm = Rn \).

**Assembler symbols**

- \(<Vd>\) is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- \(<T>\) is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  - 8B when \( Q = 0 \)
  - 16B when \( Q = 1 \)
- \(<Vn>\) is the name of the first SIMD&FP source register, encoded in the "Rn" field.

**Operation**

The description of ORR (vector, register) gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.203   MOV (to general)

Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the UMOV instruction. This means that:

- The encodings in this description are named to match the encodings of UMOV.
- The description of UMOV gives the operational pseudocode for this instruction.

\[
\text{32-bit variant}
\]

Applies when \( Q == 0 \) \&\& \( \text{imm5} == xx100 \).

\[
\text{MOV } <Wd>, <Vn>.S[<index>]
\]

is equivalent to

\[
\text{UMOV } <Wd>, <Vn>.S[<index>]
\]

and is always the preferred disassembly.

\[
\text{64-bit variant}
\]

Applies when \( Q == 1 \) \&\& \( \text{imm5} == x1000 \).

\[
\text{MOV } <Xd>, <Vn>.D[<index>]
\]

is equivalent to

\[
\text{UMOV } <Xd>, <Vn>.D[<index>]
\]

and is always the preferred disassembly.

**Assembler symbols**

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Vn>\) Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- \(<\text{index}>\) For the 32-bit variant: is the element index encoded in "imm5<4:3>".
  For the 64-bit variant: is the element index encoded in "imm5<4>".

**Operation**

The description of UMOV gives the operational pseudocode for this instruction.
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.204   MOVI

Move Immediate (vector). This instruction places an immediate constant into every vector element of the
destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state
and Exception level, an attempt to execute the instruction might be trapped.

8-bit variant
Applies when \( \text{op} == 0 \) \&\& \( \text{cmode} == 1110 \).
MOVI \( <Vd>.<T>, \#<imm_8>{, \text{LSL #0}} \)

16-bit shifted immediate variant
Applies when \( \text{op} == 0 \) \&\& \( \text{cmode} == 10x0 \).
MOVI \( <Vd>.<T>, \#<imm_8>{, \text{LSL #<amount>}} \)

32-bit shifted immediate variant
Applies when \( \text{op} == 0 \) \&\& \( \text{cmode} == 0xx0 \).
MOVI \( <Vd>.<T>, \#<imm_8>{, \text{LSL #<amount>}} \)

32-bit shifting ones variant
Applies when \( \text{op} == 0 \) \&\& \( \text{cmode} == 110x \).
MOVI \( <Vd>.<T>, \#<imm_8>, \text{MSL #<amount>} \)

64-bit scalar variant
Applies when \( Q == 0 \) \&\& \( \text{op} == 1 \) \&\& \( \text{cmode} == 1110 \).
MOVI \( <Dd>, \#<imm> \)

64-bit vector variant
Applies when \( Q == 1 \) \&\& \( \text{op} == 1 \) \&\& \( \text{cmode} == 1110 \).
MOVI \( <Vd>.2D, \#<imm> \)

Decode for all variants of this encoding

integer rd = UInt(Rd);
integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
 when '0xx00' operation = ImmediateOp_MOVI;
 when '0xx01' operation = ImmediateOp_MVNI;
 when '0xx10' operation = ImmediateOp_ORR;
 when '0xx11' operation = ImmediateOp_BIC;
 when '10x00' operation = ImmediateOp_MOVI;
when '10x01' operation = ImmediateOp_MVNI;
when '10x10' operation = ImmediateOp_ORR;
when '10x11' operation = ImmediateOp_BIC;
when '110x0' operation = ImmediateOp_MOVI;
when '110x1' operation = ImmediateOp_MVNI;
when '1110x' operation = ImmediateOp_MOVI;
when '11110' operation = ImmediateOp_MOVI;
when '11111'
  // FMOV Dn,#imm is in main FP instruction set
  if Q == '0' then UNDEFINED;
  operation = ImmediateOp_MOVI;
imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);

Assembler symbols

<d> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<d> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<imm> Is a 64-bit immediate 'aaaaaaaabbbbbbbccccccccddddddeeeeeeefgggggggghhhhhhh', encoded in "a:b:c:d:e:f:g:h".

<T> For the 8-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  8B when Q = 0
  16B when Q = 1
For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  4H when Q = 0
  8H when Q = 1
For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  2S when Q = 0
  4S when Q = 1

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the 16-bit shifted immediate variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:
  0 when cmode<1> = 0
  8 when cmode<1> = 1
defaulting to 0 if LSL is omitted.
For the 32-bit shifted immediate variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:
  0 when cmode<2:1> = 00
  8 when cmode<2:1> = 01
  16 when cmode<2:1> = 10
  24 when cmode<2:1> = 11
defaulting to 0 if LSL is omitted.
For the 32-bit shifting ones variant: is the shift amount encoded in the "cmode<0>" field. It can have the following values:
  8 when cmode<0> = 0
when \( \text{cmode}<0 \) = 1

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
    when ImmediateOp_MVNI
        result = \text{NOT}(\text{imm});
    when ImmediateOp_ORR
        operand = V[rd, datasize];
        result = operand \text{OR} \text{imm};
    when ImmediateOp_BIC
        operand = V[rd, datasize];
        result = operand \text{AND} \text{NOT}(\text{imm});

V[rd, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.205  MUL (by element)

Multiply (vector, by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<Ts>[<index>]

Decode for this encoding

integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
  when '01' index = UInt(H:L:M); Rmhi = '0';
  when '10' index = UInt(H:L); Rmhi = M;
  otherwise UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

Assembler symbols

<Vd>  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>  Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

4H  when size = 01, Q = 0
8H  when size = 01, Q = 1
2S  when size = 10, Q = 0
4S  when size = 10, Q = 1

The following encodings are reserved:

• size = 00, Q = x.
• size = 11, Q = x.

<Vn>  Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>  Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

0:Rm  when size = 01
M:Rm  when size = 10
The following encodings are reserved:
- size = 00.
- size = 11.

Restricted to V0-V15 when element size $<T_s>$ is H.

$<T_s>$

Is an element size specifier, encoded in the "size" field. It can have the following values:
- H when size = 01
- S when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

$<\text{index}>$

Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(idxdsize) operand2 = V[m, idxdsize];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) product;

element2 = UInt(Elem[operand2, index, esize]);
for e = 0 to elements-1
    element1 = UInt(Elem[operand1, e, esize]);
    product = (element1*element2)<esize-1:0>;
    Elem[result, e, esize] = product;
V[d, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.206 MUL (vector)

Multiply (vector). This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean poly = (U == '1');

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
8B when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;
for e = 0 to elements-1
  element1 = Elem[operand1, e, esize];
  element2 = Elem[operand2, e, esize];
  if poly then
    product = PolynomialMult(element1, element2)<esize-1:0>;
  else
    product = (UInt(element1)*UInt(element2))<esize-1:0>;
  Elem[result, e, esize] = product;
V[d, datasize] = result;

 Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.207  MVN

Bitwise NOT (vector). This instruction reads each vector element from the source SIMD&FP register, places the inverse of each value into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the NOT instruction. This means that:

- The encodings in this description are named to match the encodings of NOT.
- The description of NOT gives the operational pseudocode for this instruction.

**Encoding**

MVN <Vd>.<T>, <Vn>.<T>

is equivalent to

NOT  <Vd>.<T>, <Vn>.<T>

and is always the preferred disassembly.

**Assembler symbols**

<Vd>  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T>  Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- 8B  when Q = 0
- 16B  when Q = 1

<Vn>  Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation**

The description of NOT gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.208 MVNI

Move inverted Immediate (vector). This instruction places the inverse of an immediate constant into every vector element of the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

16-bit shifted immediate variant
Applies when cmode == 10x0.
MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit shifted immediate variant
Applies when cmode == 0xx0.
MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit shifting ones variant
Applies when cmode == 110x.
MVNI <Vd>.<T>, #<imm8>, MSL #<amount>

Decode for all variants of this encoding

integer rd = UInt(Rd);
integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
when '0xx01' operation = ImmediateOp_MVNI;
when '0xx11' operation = ImmediateOp_BIC;
when '10x01' operation = ImmediateOp_MVNI;
when '10x11' operation = ImmediateOp_BIC;
when '110x1' operation = ImmediateOp_MVNI;
when '1110x' operation = ImmediateOp_MOVI;
when '11111'
   // FMOV Dn,#imm is in main FP instruction set
   if Q == '0' then UNDEFINED;
   operation = ImmediateOp_MOVI;
end;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- **4H** when \( Q = 0 \)
- **8H** when \( Q = 1 \)

For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- **2S** when \( Q = 0 \)
- **4S** when \( Q = 1 \)

Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

For the 16-bit shifted immediate variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:

- **0** when \( \text{cmode}<1> = 0 \)
- **8** when \( \text{cmode}<1> = 1 \)
  
  defaulting to 0 if LSL is omitted.

For the 32-bit shifted immediate variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:

- **0** when \( \text{cmode}<2:1> = 00 \)
- **8** when \( \text{cmode}<2:1> = 01 \)
- **16** when \( \text{cmode}<2:1> = 10 \)
- **24** when \( \text{cmode}<2:1> = 11 \)
  
  defaulting to 0 if LSL is omitted.

For the 32-bit shifting ones variant: is the shift amount encoded in the "cmode<0>" field. It can have the following values:

- **8** when \( \text{cmode}<0> = 0 \)
- **16** when \( \text{cmode}<0> = 1 \)

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
  when ImmediateOp_MOVI
    result = imm;
  when ImmediateOp_MVNI
    result = NOT(imm);
  when ImmediateOp_ORR
    operand = V[rd, datasize];
    result = operand OR imm;
  when ImmediateOp_BIC
    operand = V[rd, datasize];
    result = operand AND NOT(imm);

V[rd, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
— The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.209  NEG (vector)

Negate (vector). This instruction reads each vector element from the source SIMD&FP register, negates each value, puts the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

boolean neg = (U == '1');

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when size = 11

The following encodings are reserved:

• size = 0x.
• size = 10.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 2D when size = 11, Q = 0

The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
integer element;

for e = 0 to elements-1
    element = SInt(Elem[operand, e, esize]);

\end{align*}
\]

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
— The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.211 ORN (vector)

Bitwise inclusive OR NOT (vector). This instruction performs a bitwise OR NOT between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ORN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  - 8B when Q = 0
  - 16B when Q = 1
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```plaintext
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
operand2 = NOT(operand2);
result = operand1 OR operand2;
V[d, datasize] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.212  ORR (vector, immediate)

Bitwise inclusive OR (vector, immediate). This instruction reads each vector element from the destination SIMD&FP register, performs a bitwise OR between each result and an immediate constant, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

16-bit variant

Applies when cmode == 10x1.

ORR <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit variant

Applies when cmode == 0xx1.

ORR <Vd>.<T>, #<imm8>{, LSL #<amount>}

Decode for all variants of this encoding

integer rd = UInt(Rd);
integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of

</tr>
</thead>
<tbody>
<tr>
<td>MOV (vector)</td>
<td>Rm == Rn</td>
</tr>
</tbody>
</table>

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
8B    when Q = 0
16B   when Q = 1
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
result = operand1 OR operand2;
V[d, datasize] = result;
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.214   PMUL

Polynomial Multiply. This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

For information about multiplying polynomials see *Polynomial arithmetic over \{0, 1\}* on page A1-54.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

PMUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean poly = (U == '1');

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
8B when size = 00, Q = 0
16B when size = 00, Q = 1
The following encodings are reserved:
* size = 01, Q = x.
* size = 1x, Q = x.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;
for e = 0 to elements-1
element1 = Elem[operand1, e, esize];
Element2 = Elem[operand2, e, esize];
if poly then
    product = PolynomialMult(element1, element2)<esize-1:0>;
else
    product = (UInt(element1)*UInt(element2))<esize-1:0>;
Elem[result, e, esize] = product;

V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.215  PMULL, PMULL2

Polynomial Multiply Long. This instruction multiplies corresponding elements in the lower or upper half of the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials, see Polynomial arithmetic over \{0, 1\} on page A1-54.

The PMULL instruction extracts each source vector from the lower half of each source register. The PMULL2 instruction extracts each source vector from the upper half of each source register.

The PMULL, PMULL2 variants that operate on 64-bit data quantities are defined only when FEAT_PMULL is implemented.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Encoding

PMULL\{2\} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

### Decode for this encoding

```cpp
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '01' || size == '10' then UNDEFINED;
if size == '11' && !HaveBit128PMULLExt() then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

### Assembler symbols

2  

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd>  

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  

Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
- 1Q when size = 11

The following encodings are reserved:

- size = 01.
- size = 10.

The '1Q' arrangement is only allocated in an implementation that includes the Cryptographic Extension, and is otherwise RESERVED.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 1D when size = 11, Q = 0
- 2D when size = 11, Q = 1

The following encodings are reserved:

- size = 01, Q = x.
- size = 10, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, 2*esize] = PolynomialMult(element1, element2);

V[d, 2*datasize] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.216 RADDHN, RADDHN2

Rounding Add returning High Narrow. This instruction adds each vector element in the first source SIMD&FP register to the corresponding vector element in the second source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are rounded. For truncated results, see ADDHN, ADDHN2.

The RADDHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RADDHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

RADDHN(2) <Vd>..<Tb>, <Vn>..<Ta>, <Vm>..<Ta>

Decode for this encoding

```plaintext
ingen int d = UInt(Rd);
gen int n = UInt(Rn);
gen int m = UInt(Rm);

if size == '11' then UNDEFINED;
gen int esize = 8 << UInt(size);
gen int datasize = 64;
gen int part = UInt(Q);
gen int elements = datasize DIV esize;

bool sub_op = (o1 == '1');
gen bool round = (U == '1');
```

Assembler symbols

- 2: Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
  - [absent] when Q = 0
  - [present] when Q = 1

- <Vd>: Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Tb>: Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

  - 8H when size = 01, Q = 1
  - 2S when size = 10, Q = 0
  - 4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

\( <Vn> \) Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\( <Ta> \) Is an arrangement specifier, encoded in the "size" field. It can have the following values:

\( 8H \) when size = 00
\( 4S \) when size = 01
\( 2D \) when size = 10

The encoding size = 11 is reserved.

\( <Vm> \) Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n, 2*datasize];
bits(2*datasize) operand2 = V[m, 2*datasize];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;
for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;
Vpart[d, part, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.217   RAX1

Rotate and Exclusive OR rotates each 64-bit element of the 128-bit vector in a source SIMD&FP register left by 1, performs a bitwise exclusive OR of the resulting 128-bit vector and the vector in another source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when FEAT_SHA3 is implemented.

**Advanced SIMD**

(_FEAT_SHA3_

   —  The values of the data supplied in any of its registers.
   —  The values of the NZCV flags.
C7.2.222  RSHRN, RSHRN2

Rounding Shift Right Narrow (immediate). This instruction reads each unsigned integer value from the vector in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see SHRN, SHRN2.

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Encoding

integer elements = datasize DIV esize;
integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
```

#### Assembler symbols

2  

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent]  when Q = 0
- [present]  when Q = 1

\(<Vd>\)  

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\(<Tb>\)  

Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

- 8B  when immh = 0001, Q = 0
- 16B  when immh = 0001, Q = 1
- 4H  when immh = 001x, Q = 0
- 8H  when immh = 001x, Q = 1
- 2S  when immh = 01xx, Q = 0
- 4S  when immh = 01xx, Q = 1

See *Advanced SIMD modified immediate* on page C4-632 when immh = 0000, Q = x.
The encoding \( \text{immh} = 1xxx, Q = x \) is reserved.

\(<Vn>\)
Is the name of the SIMD&FP source register, encoded in the "Rn" field.

\(<Ta>\)
Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- \( 8H \) when \( \text{immh} = 0001 \)
- \( 4S \) when \( \text{immh} = 001x \)
- \( 2D \) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

\(<\text{shift}>\)
Is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- \( (16-\text{UInt} (\text{immh:immb})) \) when \( \text{immh} = 0001 \)
- \( (32-\text{UInt} (\text{immh:immb})) \) when \( \text{immh} = 001x \)
- \( (64-\text{UInt} (\text{immh:immb})) \) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

**Operation**

CheckFPAdvSIMDEnabled64();

bits(datasize*2) operand = V[n, datasize*2];

bits(datasize) result;

integer round_const = if round then \((1 << (\text{shift} - 1))\) else 0;

integer element;

for e = 0 to elements - 1
   element = (UInt(Elem[operand, e, 2*esize]) + round_const) >> \text{shift};
   Elem[result, e, esize] = element<esize - 1:0>;

Vpart[d, part, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
RSUBHN, RSUBHN2

Rounding Subtract returning High Narrow. This instruction subtracts each vector element of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are rounded. For truncated results, see SUBHN, SUBHN2.

The RSUBHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

RSUBHN(2) <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

\(<Vn>\) Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\(<Ta>\) Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- \(8\) when size = 00
- \(4\) when size = 01
- \(2\) when size = 10

The encoding size = 11 is reserved.

\(<Vm>\) Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n, 2*datasize];
bits(2*datasize) operand2 = V[m, 2*datasize];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;
for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;
Vpart[d, part, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.224   SABA

Signed Absolute difference and Accumulate. This instruction subtracts the elements of the vector of the second source SIMD&FP register from the corresponding elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the elements of the vector of the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.225  SABAL, SABAL2

Signed Absolute difference and Accumulate Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The SABAL instruction extracts each source vector from the lower half of each source register. The SABAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SABAL[2] <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.231 SADDLV

Signed Add Long across Vector. This instruction adds every vector element in the source SIMD&FP register together, and writes the scalar result to the destination SIMD&FP register. The destination scalar is twice as long as the source vector elements. All the values in this instruction are signed integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SADDLV <V><d>, <Vn>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');

Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
H when size = 00
S when size = 01
D when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
8B when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
4S when size = 10, Q = 1

The following encodings are reserved:
- size = 10, Q = 0.
- size = 11, Q = x.
Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
integer sum;

sum = Int(Elem[operand, 0, esize], unsigned);
for e = 1 to elements-1
   sum = sum + Int(Elem[operand, e, esize], unsigned);
V[d, 2*esize] = sum<2*esize-1:0>;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.232 SADDW, SADDW2

Signed Add Wide. This instruction adds vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the results in a vector, and writes the vector to the SIMD&FP destination register.

The SADDW instruction extracts the second source vector from the lower half of the second source register. The SADDW2 instruction extracts the second source vector from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

**Assembler symbols**

- 2: Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
  - [absent] when Q = 0
  - [present] when Q = 1

- <Vd>: Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Ta>: Is an arrangement specifier, encoded in the "size" field. It can have the following values:
  - 8H when size = 00
  - 4S when size = 01
  - 2D when size = 10

  The encoding size = 11 is reserved.

- <Vn>: Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

- <Vm>: Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n, 2*datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, 2*esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  if sub_op then
    sum = element1 - element2;
  else
    sum = element1 + element2;
  Elem[result, e, 2*esize] = sum<2*esize-1:0>;
V[d, 2*datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.233 SCVTF (vector, fixed-point)

Signed fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

**Scalar**

C7.2.237  SDOT (by element)

Dot Product signed arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note  
ID_AA64ISAR0_EL1.DP indicates whether this instruction is supported.

  — The values of the NZCV flags.
C7.2.250 SHA512H2

SHA512 Hash update part 2 takes the values from the three 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the sigma0 and majority functions of two iterations of the SHA512 computation. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when FEAT_SHA512 is implemented.

**Advanced SIMD**

Vtmp<63:0> = (Vtmp<63:0> + NSigma0 + w<63:0>);

V[d, 128] = Vtmp;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
— The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.251 SHA512SU0

SHA512 Schedule Update 0 takes the values from the two 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the gamma0 functions of two iterations of the SHA512 schedule update that are performed after the first 16 iterations within a block. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when FEAT_SHA512 is implemented.

if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
```

**Assembler symbols**

<V> Is a width specifier, encoded in the "immh" field. It can have the following values:

D when immh = lxxx
The encoding $\text{immh} = 0xxx$ is reserved.

$d$ Is the number of the SIMD&FP destination register, in the "Rd" field.

$n$ Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

$Vd$ Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

$T$ Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

- $8B$ when $\text{immh} = 0001$, $Q = 0$
- $16B$ when $\text{immh} = 0001$, $Q = 1$
- $4H$ when $\text{immh} = 001x$, $Q = 0$
- $8H$ when $\text{immh} = 001x$, $Q = 1$
- $2S$ when $\text{immh} = 01xx$, $Q = 0$
- $4S$ when $\text{immh} = 01xx$, $Q = 1$
- $2D$ when $\text{immh} = 1xxx$, $Q = 1$

See Advanced SIMD modified immediate on page C4-632 when $\text{immh} = 0000$, $Q = x$. The encoding $\text{immh} = 1xxx$, $Q = 0$ is reserved.

$Vn$ Is the name of the SIMD&FP source register, encoded in the "Rn" field.

$\text{shift}$ For the scalar variant: is the left shift amount, in the range 0 to 63, encoded in the "immh:immb" field. It can have the following values:

- $(\text{UInt}(\text{immh:immb})-64)$ when $\text{immh} = 1xxx$

The encoding $\text{immh} = 0xxx$ is reserved.

For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:

- $(\text{UInt}(\text{immh:immb})-8)$ when $\text{immh} = 0001$
- $(\text{UInt}(\text{immh:immb})-16)$ when $\text{immh} = 001x$
- $(\text{UInt}(\text{immh:immb})-32)$ when $\text{immh} = 01xx$
- $(\text{UInt}(\text{immh:immb})-64)$ when $\text{immh} = 1xxx$

See Advanced SIMD modified immediate on page C4-632 when $\text{immh} = 0000$.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bias(datasize) result;

for $e = 0$ to $\text{elements}-1$
   \[\text{Elem}[result, e, esize] = \text{LSL}(\text{Elem}[operand, e, esize], \text{shift});\]

\[V[d, datasize] = result;\]

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
The values of the NZCV flags.
C7.2.255   SHLL, SHLL2

Shift Left Long (by element size). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, left shifts each result by the element size, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The SHLL instruction extracts vector elements from the lower half of the source register. The SHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = esize;
boolean unsigned = FALSE;   // Or TRUE without change of functionality

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
8H when size = 00
4S when size = 01
2D when size = 10

The encoding size = 11 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
8B when size = 00, Q = 0
16B when size = 00, Q = 1
4H  when size = 01, Q = 0
8H  when size = 01, Q = 1
2S  when size = 10, Q = 0
4S  when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<shift>  Is the left shift amount, which must be equal to the source element width in bits, encoded in the "size" field. It can have the following values:
8     when size = 00
16    when size = 01
32    when size = 10

The encoding size = 11 is reserved.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part, datasize];
bits(2*datasize) result;
integer element;
for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d, 2*datasize] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.256    SHRN, SHRN2

Shift Right Narrow (immediate). This instruction reads each unsigned integer value from the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are truncated. For rounded results, see RSHRN, RSHRN2.

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

\[
\begin{array}{cccccccccccccccccccc}
\text{SHRN}\{2\} & & \text{<Vd>}, & \text{<Tb>}, & \text{<Vn>}, & \text{<Ta>}, & \text{#<shift>} \\
\end{array}
\]

Decode for this encoding

\[
\begin{align*}
\text{integer } d & = \text{UInt}(Rd); \\
\text{integer } n & = \text{UInt}(Rn); \\
\text{if } \text{immh} == '0000' \text{ then } & \text{SEE "Advanced SIMD modified immediate";} \\
\text{if } \text{immh<3>} == '1' \text{ then } & \text{UNDEFINED;} \\
\text{integer } \text{esize} & = 8 \times \text{HighestSetBit}(\text{immh}); \\
\text{integer } \text{datasize} & = 64; \\
\text{integer } \text{part} & = \text{UInt}(Q); \\
\text{integer } \text{elements} & = \text{datasize} \text{ DIV esize}; \\
\text{integer } \text{shift} & = (2 \times \text{esize}) - \text{UInt}(\text{immh}:\text{immb}); \\
\text{boolean } \text{round} & = (\text{op} == '1'); \\
\end{align*}
\]

Assembler symbols

2    Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent]    when Q = 0
[present]    when Q = 1

<Vd>    Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb>    Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B    when immh = 0001, Q = 0
16B    when immh = 0001, Q = 1
4H    when immh = 001x, Q = 0
8H    when immh = 001x, Q = 1
2S    when immh = 01xx, Q = 0
4S    when immh = 01xx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.
The encoding \( \text{immh} = 1xxx \), \( Q = x \) is reserved.

\(<Vn>\)
Is the name of the SIMD&FP source register, encoded in the "Rn" field.

\(<Ta>\)
Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

- \( \text{8H} \) when \( \text{immh} = 0001 \)
- \( \text{4S} \) when \( \text{immh} = 001x \)
- \( \text{2D} \) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

\(<\text{shift}>\)
Is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

- \( (16-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 0001 \)
- \( (32-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 001x \)
- \( (64-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n, datasize*2];
bhits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

for e = 0 to elements-1
    element = (UInt(Elem[operand, e, 2*esize]) + round_const) >> shift;
    Elem[result, e, esize] = element<esize-1:0>;
Vpart[d, part, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.257 SHSUB

Signed Halving Subtract. This instruction subtracts the elements in the vector in the second source SIMD&FP register from the corresponding elements in the vector in the first source SIMD&FP register, shifts each result right one bit, places each result into elements of a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  - 2S when size == 10, Q == 0
  - 4S when size == 10, Q == 1
  - The encoding size = 11, Q = x is reserved.
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
b bits(datasize) operand1 = V[n, datasize];
b bits(datasize) operand2 = V[m, datasize];
b bits(datasize) result;
integer element1;
integer element2;
integer diff;
for e = 0 to elements-1
```
element1 = Int(Elem[operand1, e, esize], unsigned);
element2 = Int(Elem[operand2, e, esize], unsigned);
diff = (element1 - element2) >> 1;
Elem[result, e, esize] = diff<esize-1:0>;
V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.258   **SLI**

Shift Left and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, left shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the left of each vector element in the source register are lost.

The following figure shows the operation of shift left by 3 for an 8-bit vector element.

![Figure showing SLI operation](image)

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

type integer datasize = if Q == '1' then 128 else 64;
type integer elements = datasize DIV esize;
type integer shift = UInt(immh:immb) - esize;
```

Assembler symbols

- `<V>`: Is a width specifier, encoded in the "immh" field. It can have the following values:
  - D when immh = 1xxx
  - The encoding immh = 0xxx is reserved.

- `<d>`: Is the number of the SIMD&FP destination register, in the "Rd" field.

- `<n>`: Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

- `<Vd>`: Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- `<T>`: Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
  - 8B when immh = 0001, Q = 0
  - 16B when immh = 0001, Q = 1
  - 4H when immh = 001x, Q = 0
  - 8H when immh = 001x, Q = 1
  - 2S when immh = 01xx, Q = 0
  - 4S when immh = 01xx, Q = 1
  - 2D when immh = 1xxx, Q = 1

  See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.

  - The encoding immh = 1xxx, Q = 0 is reserved.

- `<Vn>`: Is the name of the SIMD&FP source register, encoded in the "Rn" field.

- `<shift>`: For the scalar variant: is the left shift amount, in the range 0 to 63, encoded in the "immh:immb" field. It can have the following values:
  - (UInt(immh:immb)-64) when immh = 1xxx

  The encoding immh = 0xxx is reserved.

  For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:
  - (UInt(immh:immb)-8) when immh = 0001
  - (UInt(immh:immb)-16) when immh = 001x
  - (UInt(immh:immb)-32) when immh = 01xx
  - (UInt(immh:immb)-64) when immh = 1xxx

  See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

Operation for all encodings

```plaintext
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) operand2 = V[d, datasize];
```
bits(datasize) result;
bits(esize) mask = LSL(Ones(esize), shift);
bits(esize) shifted;
for e = 0 to elements-1
    shifted = LSL(Elem[operand, e, esize], shift);
    Elem[result, e, esize] = (Elem[operand2, e, esize] AND NOT(mask)) OR shifted;
V[d, datasize] = result;

Operational information

  — The values of the NZCV flags.
C7.2.265   SM3TT2B

SM3TT2B takes three 128-bit vectors from three source SIMD&FP registers, and a 2-bit immediate index value, and returns a 128-bit result in the destination SIMD&FP register. It performs a 32-bit majority function between the three 32-bit fields held in the upper three elements of the first source vector, and adds the resulting 32-bit value and the following three other 32-bit values:

- The bottom 32-bit element of the first source vector, Vd, that was used for the 32-bit majority function.
- The 32-bit element held in the top 32 bits of the second source vector, Vn.
- A 32-bit element indexed out of the third source vector, Vm.

A three-way exclusive OR is performed of the result of this addition, the result of the addition rotated left by 9, and the result of the addition rotated left by 17. The result of this exclusive OR is returned as the top element of the returned result. The other elements of this result are taken from elements of the first source vector, with the element returned in bits<63:32> being rotated left by 19.

This instruction is implemented only when FEAT_SM3 is implemented.

Advanced SIMD

(FEAT_SM3)

```
| 31 30 29 28|27 26 25 24|23 22 21 20| 16|15 14 13 12|11 10 9 | 5 4 | 0 |

```

Assembler symbols

- `<Vd>` Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
- `<Vn>` Is the name of the second SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the third SIMD&FP source register, encoded in the "Rm" field.
- `<imm2>` Is a 32-bit element indexed out of `<Vm>`, encoded in "imm2".

Operation

```c
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m, 128];
bits(128) Vn = V[n, 128];
bits(128) Vd = V[d, 128];
bits(32) Wj;
bits(128) result;
bits(32) TT2;

Wj = Elem[Vm, i, 32];
```
\[
TT2 = (Vd<127:96> \text{ AND } Vd<95:64>) \text{ OR } (\text{NOT}(Vd<127:96>) \text{ AND } Vd<63:32>); \\
TT2 = (TT2+Vd<31:0>+Vn<127:96>+Wj)<31:0>;
\]

\[
\begin{align*}
\text{result}<31:0> &= Vd<63:32>; \\
\text{result}<63:32> &= \text{ROL}(Vd<95:64>, 19); \\
\text{result}<95:64> &= Vd<127:96>; \\
\text{result}<127:96> &= TT2 \text{ EOR ROL}(TT2, 9) \text{ EOR ROL}(TT2, 17); \\
V[d, 128] &= \text{result};
\end{align*}
\]

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.266 SM4E

SM4 Encode takes input data as a 128-bit vector from the first source SIMD&FP register, and four iterations of the round key held as the elements of the 128-bit vector in the second source SIMD&FP register. It encrypts the data by four rounds, in accordance with the SM4 standard, returning the 128-bit result to the destination SIMD&FP register.

This instruction is implemented only when FEAT_SM4 is implemented.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.274 SMLAL, SMLAL2 (by element)

Signed Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element in the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

The SMLAL instruction extracts vector elements from the lower half of the first source register. The SMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

integer idxdsize = if H == '1' then 128 else 64;

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.278   SMMLA (vector)

Signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of signed 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  

Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 4S when size = 01
- 2D when size = 10

The following encodings are reserved:

- size = 00.
• size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The following encodings are reserved:
• size = 00, Q = x.
• size = 11, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
0:Rm when size = 01
M:Rm when size = 10
The following encodings are reserved:
• size = 00.
• size = 11.
Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:
H when size = 01
S when size = 10
The following encodings are reserved:
• size = 00.
• size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
H:L:M when size = 01
H:L when size = 10
The following encodings are reserved:
• size = 00.
• size = 11.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(idxdsize) operand2 = V[m, idxdsize];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = product;

V[d, 2*datasize] = result;
Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.281 SMULL, SMULL2 (vector)

Signed Multiply Long (vector). This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

The destination vector elements are twice as long as the elements that are multiplied.

The SMULL instruction extracts each source vector from the lower half of each source register. The SMULL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');

**Assembler symbols**

2  
Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd>  
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  
Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00
4S when size = 01
2D when size = 10

The encoding size = 11 is reserved.

<Vn>  
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb>  
Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;
integer element1;
integer element2;
for e = 0 to elements-1

   Elem[result, e, 2*esize] = (element1*element2)<2*esize-1:0>;
V[d, 2*datasize] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.282   SQABS

Signed saturating Absolute value. This instruction reads each vector element from the source SIMD&FP register, puts the absolute value of the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

\[
\begin{array}{|ccccccccccccc|cc|}

\hline
\end{array}
\]

Encoding

SQABS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');

Assembler symbols

<\text{V}> Is a width specifier, encoded in the "size" field. It can have the following values:

- 8 when size = 00
H  when size = 01
S  when size = 10
D  when size = 11

<d>  Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n>  Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T>  Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
8B  when size = 00, Q = 0
16B when size = 00, Q = 1
4H  when size = 01, Q = 0
8H  when size = 01, Q = 1
2S  when size = 10, Q = 0
4S  when size = 10, Q = 1
2D  when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
integer element;
boolean sat;

for e = 0 to elements-1

    (Elem[result, e, esize], sat) = SatQ(sum, esize, unsigned);
    if sat then FPSR.QC = '1';
V[d, datasize] = result;
```
C7.2.284  SQDMLAL, SQDMLAL2 (by element)

Signed saturating Doubling Multiply-Add Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and accumulates the final results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The SQDMLAL instruction extracts vector elements from the lower half of the first source register. The SQDMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    if sat1 || sat2 then FPSR.QC = '1';
V[d, 2*datasize] = result;
C7.2.286  SQDMLSL, SQDMLSL2 (by element)

Signed saturating Doubling Multiply-Subtract Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and subtracts the final results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The SQDMLSL instruction extracts vector elements from the lower half of the first source register. The SQDMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.287   SQDMLSL, SQDMLSL2 (vector)

Signed saturating Doubling Multiply-Subtract Long. This instruction multiplies corresponding signed integer
values in the lower or upper half of the vectors of the two source SIMD&FP registers, doubles the results, and
subtracts the final results from the vector elements of the destination SIMD&FP register. The destination vector
elements are twice as long as the elements that are multiplied.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation
bit FPSR.QC is set.

The SQDMLSL instruction extracts each source vector from the lower half of each source register. The SQDMLSL2
instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state
and Exception level, an attempt to execute the instruction might be trapped.

V[d, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.289  SQDMULH (vector)

Signed saturating Doubling Multiply returning High half. This instruction multiplies the values of corresponding elements of the two source SIMD&FP registers, doubles the results, places the most significant half of the final results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see SQRDMULH (vector).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.290  SQDMULL, SQDMULL2 (by element)

Signed saturating Doubling Multiply Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, places the final results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The SQDMULL instruction extracts the first source vector from the lower half of the first source register. The SQDMULL2 instruction extracts the first source vector from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper
64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have
the following values:
  [absent] when Q = 0
  [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

  4S when size = 01
  2D when size = 10

The following encodings are reserved:
  * size = 00.
  * size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

  4H when size = 01, Q = 0
  8H when size = 01, Q = 1
  2S when size = 10, Q = 0
  4S when size = 10, Q = 1

The following encodings are reserved:
  * size = 00, Q = x.
  * size = 11, Q = x.

<VA> Is the destination width specifier, encoded in the "size" field. It can have the following values:

  S when size = 01
  D when size = 10

The following encodings are reserved:
  * size = 00.
  * size = 11.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<vb> Is the source width specifier, encoded in the "size" field. It can have the following values:

  H when size = 01
  S when size = 10
The following encodings are reserved:
- size = 00.
- size = 11.

<n>
Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm>
Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts>
Is an element size specifier, encoded in the "size" field. It can have the following values:
- H when size = 01
- S when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

<index>
Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.295  SQRDMLSH (by element)

Signed Saturating Rounding Doubling Multiply Subtract returning High Half (by element). This instruction multiplies the vector elements of the first source SIMD&FP register with the value of a vector element of the second source SIMD&FP register without saturating the multiply results, doubles the results, and subtracts the most significant half of the final results from the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSR.QC, is set if saturation occurs.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d, datasize] = result;
C7.2.300 SQRSHRN, SQRSHRN2

Signed saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see SQRSHRN, SQRSHRN2.

The SQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
8B when immh = 0001, Q = 0
16B when immh = 0001, Q = 1
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
8H when immh = 0001
4S when immh = 001x
2D when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.
The encoding immh = 1xxx is reserved.

<Vb> Is the destination width specifier, encoded in the "immh" field. It can have the following values:
B when immh = 0001
H when immh = 001x
S when immh = 01xx

The following encodings are reserved:
• immh = 0000.
• immh = 1xxx.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.
<Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:
H when immh = 0001
S when immh = 001x
D when immh = 01xx
The following encodings are reserved:
- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

\(<n>\) Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

\(<\text{shift}>\) For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:
- \( (16-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 0001 \)
- \( (32-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 001x \)
- \( (64-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 01xx \)

The following encodings are reserved:
- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- \( (16-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 0001 \)
- \( (32-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 001x \)
- \( (64-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

Operation for all encodings

```c
CheckFPAdvsIMDEnabled64();
bits(datasize*2) operand = V[n, datasize*2];
bias(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;
for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';
Vpart[d, part, datasize] = result;
```

C7.2.301   SQRSRSHRUN, SQRSRSHRUN2

Signed saturating Rounded Shift Right Unsigned Narrow (immediate). This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are rounded. For truncated results, see SQRSRSHRUN, SQRSRSHRUN2.

The SQRSRSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQRSRSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

bitsu(data) operand = V[n, datasize];
bitsu(data) result;
integer element;
boolean sat;

for e = 0 to elements-1
   element = Int(Elem[operand, e, esize], src_unsigned) << shift;
   (Elem[result, e, esize], sat) = SatQ(element, esize, dst_unsigned);
   if sat then FPSR.QC = '1';

V[d, datasize] = result;
```
C7.2.303   SQSHL (register)

Signed saturating Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see SQRSHL.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

<\V> Is a width specifier, encoded in the "immmh" field. It can have the following values:
    B when immh = 0001
    H when immh = 001x
    S when immh = 01xx
    D when immh = 1xxx

The encoding immh = 0000 is reserved.

<\d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<\n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<\Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<\T> Is an arrangement specifier, encoded in the "immmh:Q" field. It can have the following values:
    8B when immh = 0001, Q = 0
    16B when immh = 0001, Q = 1
    4H when immh = 001x, Q = 0
    8H when immh = 001x, Q = 1
    2S when immh = 01xx, Q = 0
    4S when immh = 01xx, Q = 1
    2D when immh = 1xxx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = 0 is reserved.

<\Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the left shift amount, in the range 0 to the operand width in bits minus 1, encoded in the "immmh:immb" field. It can have the following values:
    (UInt(immh:immb)-8) when immh = 0001
    (UInt(immh:immb)-16) when immh = 001x
    (UInt(immh:immb)-32) when immh = 01xx
    (UInt(immh:immb)-64) when immh = 1xxx

The encoding immh = 0000 is reserved.

For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immmh:immb" field. It can have the following values:
    (UInt(immh:immb)-8) when immh = 0001
    (UInt(immh:immb)-16) when immh = 001x
    (UInt(immh:immb)-32) when immh = 01xx
(UInt(immh:immb)-64) when immh = 1xxx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
integer element;
boolean sat;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], src_unsigned) << shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, dst_unsigned);
    if sat then FPSR.QC = '1';

V[d, datasize] = result;
**C7.2.305 SQSHRN, SQSHRN2**

Signed saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts and truncates each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. For rounded results, see SQRSRN, SQRSRN2.

The SQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

## Assembler symbols

2

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Td>

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb>

Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

- 8B when immh = 0001, Q = 0
- 16B when immh = 0001, Q = 1
- 4H when immh = 001x, Q = 0
- 8H when immh = 001x, Q = 1
- 2S when immh = 01xx, Q = 0
- 4S when immh = 01xx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

<Vn>

Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta>

Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

- 8H when immh = 0001
- 4S when immh = 001x
- 2D when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vb>

Is the destination width specifier, encoded in the "immh" field. It can have the following values:

- 8 when immh = 0001
- H when immh = 001x
- S when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<d>

Is the number of the SIMD&FP destination register, in the "Rd" field.

<Va>

Is the source width specifier, encoded in the "immh" field. It can have the following values:

- H when immh = 0001
- S when immh = 001x
- D when immh = 01xx
The following encodings are reserved:
- $\text{immh} = 0000$
- $\text{immh} = 1xxx$

$n$ is the number of the first SIMD&FP source register, encoded in the "Rn" field.

$\text{<shift>}$ For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:
- $(16-\text{UInt}(\text{immh:immb}))$ when $\text{immh} = 0001$
- $(32-\text{UInt}(\text{immh:immb}))$ when $\text{immh} = 001x$
- $(64-\text{UInt}(\text{immh:immb}))$ when $\text{immh} = 01xx$

The following encodings are reserved:
- $\text{immh} = 0000$
- $\text{immh} = 1xxx$

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- $(16-\text{UInt}(\text{immh:immb}))$ when $\text{immh} = 0001$
- $(32-\text{UInt}(\text{immh:immb}))$ when $\text{immh} = 001x$
- $(64-\text{UInt}(\text{immh:immb}))$ when $\text{immh} = 01xx$

See Advanced SIMD modified immediate on page C4-632 when $\text{immh} = 0000$.
The encoding $\text{immh} = 1xxx$ is reserved.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n, datasize*2];
bists(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;
for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';
Vpart[d, part, datasize] = result;
```
C7.2.306  SQSHRUN, SQSHRUN2

Signed saturating Shift Right Unsigned Narrow (immediate). This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see SQRSHRUN, SQRSHRUN2.

The SQSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

• \( \text{immh} = 1xxx \).

\(<\text{n}>\)

Is the number of the first SIMD\&FP source register, encoded in the "Rn" field.

\(<\text{shift}>\)

For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

- \((16-\text{UInt}(\text{immh:immb}))\) when \( \text{immh} = 0001 \)
- \((32-\text{UInt}(\text{immh:immb}))\) when \( \text{immh} = 001x \)
- \((64-\text{UInt}(\text{immh:immb}))\) when \( \text{immh} = 01xx \)

The following encodings are reserved:

- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

- \((16-\text{UInt}(\text{immh:immb}))\) when \( \text{immh} = 0001 \)
- \((32-\text{UInt}(\text{immh:immb}))\) when \( \text{immh} = 001x \)
- \((64-\text{UInt}(\text{immh:immb}))\) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

### Operation for all encodings

```assembly
CheckFPAdvSIMDEnabled64();
bias(datasize\times2) \text{operand} = V[n, datasize\times2];
bias(datasize) result;
integer round_const = if round then \((1 \ll (\text{shift} - 1))\) else 0;
integer element;
boolean sat;
for e = 0 to elements -1
  element = (SInt(Elem[\text{operand}, e, 2*esize]) + round_const) >> shift;
  (Elem[\text{result}, e, esize], sat) = UnsignedSatQ(element, esize);
  if sat then FPSR.QC = '1';
Vpart[d, part, datasize] = result;
```

```
C7.2.307   SQSUB

Signed saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

The encoding size = 11 is reserved.

<Vb>
Is the destination width specifier, encoded in the "size" field. It can have the following values:

B when size = 00
H when size = 01
S when size = 10

The encoding size = 11 is reserved.

<d>
Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Va>
Is the source width specifier, encoded in the "size" field. It can have the following values:

H when size = 00
S when size = 01
D when size = 10

The encoding size = 11 is reserved.

<n>
Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
b bits(2*datasize) operand = V[n, 2*datasize];
b bits(datasize) result;
b bits(2*esize) element;
boolean sat;
for e = 0 to elements-1
    element = Elem[operand, e, 2*esize];
    (Elem[result, e, esize], sat) = SatQ(Int(element, unsigned), esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part, datasize] = result;
C7.2.309 SQXTUN, SQXTUN2

Signed saturating extract Unsigned Narrow. This instruction reads each signed integer value in the vector of the source SIMD&FP register, saturates the value to an unsigned integer value that is half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The SQXTUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQXTUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

2

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd>

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb>

Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn>

Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta>

Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
- 4S when size = 01
- 2D when size = 10

The encoding size = 11 is reserved.

<Vb>

Is the destination width specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10

The encoding size = 11 is reserved.

<d>

Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Va>

Is the source width specifier, encoded in the "size" field. It can have the following values:

- H when size = 00
- S when size = 01
- D when size = 10

The encoding size = 11 is reserved.

<n>

Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n, 2*datasize];
bits(datasize) result;
bits(2*esize) element;
boolean sat;

for e = 0 to elements-1
  element = Elem[operand, e, 2*esize];
  (Elem[result, e, esize], sat) = UnsignedSatQ(SInt(element), esize);
  if sat then FPSR.QC = '1';
Vpart[d, part, datasize] = result;
C7.2.310  SRHADD

Signed Rounding Halving Add. This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see SHADD.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

**Assembler symbols**

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```python
CheckFPAdvSIMDEnabled64();
bis(datasize) operand1 = V[n, datasize];
bis(datasize) operand2 = V[m, datasize];
bis(datasize) result;
integer element1;
integer element2;
```
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    sum = (element1 + element2 + 1) >> 1;
    Elem[result, e, esize] = sum<esize-1:0>;

V[d, datasize] = result;
C7.2.311 SRI

Shift Right and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the right of each vector element of the source register are lost.

The following figure shows the operation of shift right by 3 for an 8-bit vector element.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<shift> For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:

- (128-UInt(immh:immb)) when immh = 1xxx

The encoding immh = 0xxx is reserved.

For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:

- (16-UInt(immh:immb)) when immh = 0001
- (32-UInt(immh:immb)) when immh = 001x
- (64-UInt(immh:immb)) when immh = 01xx
- (128-UInt(immh:immb)) when immh = 1xxx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

Operation for all encodings

```plaintext
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) operand2 = V[d, datasize];
```
bits(datasize) result;
bits(esize) mask = LSR(Ones(esize), shift);
bits(esize) shifted;

for e = 0 to elements-1
    shifted = LSR(Elem[operand, e, esize], shift);
    Elem[result, e, esize] = (Elem[operand2, e, esize] AND NOT(mask)) OR shifted;
    V[d, datasize] = result;

Operational information
If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.312 SRSHL

Signed Rounding Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see SSSH.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.314   SRSRA

Signed Rounding Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are rounded. For truncated results, see SSRA.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

<V>  Is a width specifier, encoded in the "immh" field. It can have the following values:
  D  when immh = 1xxx
The encoding immh = 0xxx is reserved.
<\d> Is the number of the SIMD&FP destination register, in the "Rd" field.
<n>  Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>  Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
  8B  when immh = 0001, Q = 0
  16B when immh = 0001, Q = 1
  4H  when immh = 001x, Q = 0
  8H  when immh = 001x, Q = 1
  2S  when immh = 01xx, Q = 0
  4S  when immh = 01xx, Q = 1
  2D  when immh = 1xxx, Q = 1
See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = 0 is reserved.
<Vn>  Is the name of the SIMD&FP source register, encoded in the "Rn" field.
<\shift> For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:
  (128-UInt(immh:immb)) when immh = 1xxx
The encoding immh = 0xxx is reserved.
For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:
  (16-UInt(immh:immb)) when immh = 0001
  (32-UInt(immh:immb)) when immh = 001x
  (64-UInt(immh:immb)) when immh = 01xx
  (128-UInt(immh:immb)) when immh = 1xxx
See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

Operation for all encodings

CheckFPAdvSIMDEnabled64();

for e = 0 to elements - 1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;

V[d, datasize] = result;
C7.2.315 SSHL

Signed Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts each value by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see SRSHL.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.316 SSHLL, SSHLL2

Signed Shift Left Long (immediate). This instruction reads each vector element from the source SIMD&FP register, left shifts each vector element by the specified shift amount, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SSHLL instruction extracts vector elements from the lower half of the source register. The SSHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias SXTL, SXTL2. See Alias conditions for details of when each alias is preferred.

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when \( Q = 0 \)

[present] when \( Q = 1 \)

\(<\text{Vd}>\) Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\(<\text{Ta}>\) Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when \( \text{immb} = 0001 \)
4S when immh = 001x  
2D when immh = 01xx  
See Advanced SIMD modified immediate on page C4-632 when imm = 0000.
The encoding immh = 1xxx is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

- 8B when immh = 0001, Q = 0
- 16B when immh = 0001, Q = 1
- 4H when immh = 001x, Q = 0
- 8H when immh = 001x, Q = 1
- 2S when immh = 01xx, Q = 0
- 4S when immh = 01xx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when imm = 0000, Q = x.
The encoding immh = 1xxx, Q = x is reserved.

<shift> Is the left shift amount, in the range 0 to the source element width in bits minus 1, encoded in the
"immh:immb" field. It can have the following values:

- (UInt(immh:immb)-8) when immh = 0001
- (UInt(immh:immb)-16) when immh = 001x
- (UInt(immh:immb)-32) when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when imm = 0000.
The encoding immh = 1xxx is reserved.

- \( 2D \) when \( \text{immh} = 1\text{xxx}, Q = 1 \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000, Q = x \).

The encoding \( \text{immh} = 1\text{xxx}, Q = 0 \) is reserved.

\[ <Vn> \]
Is the name of the SIMD&FP source register, encoded in the "Rn" field.

\[ <\text{shift}> \]
For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:

- \( (128-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 1\text{xxx} \)
  The encoding \( \text{immh} = 0\text{xxx} \) is reserved.

For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:

- \( (16-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 0001 \)
- \( (32-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 001x \)
- \( (64-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 01xx \)
- \( (128-\text{UInt}(\text{immh:immb})) \) when \( \text{immh} = 1\text{xxx} \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
operand2 = if accumulate then V[d, datasize] else Zeros(datasize);
for e = 0 to elements-1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.319  SSUBL, SSUBL2

Signed Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are twice as long as the source vector elements.

The SSUBL instruction extracts each source vector from the lower half of each source register. The SSUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

boolean unsigned = (U == '1');

Assembler symbols

2  Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

| [absent] | when Q = 0 |
| [present] | when Q = 1 |

<Vd>  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  Is an arrangement specifier, encoded in the "size" field. It can have the following values:

| 8H | 4S | 2D |
| when size = 00 | when size = 01 | when size = 10 |

The encoding size = 11 is reserved.

<Vn>  Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb>  Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

| 88 |
| when size = 00, Q = 0 |
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vm> is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bite(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;
V[d, 2*datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.327  ST4 (multiple structures)

Store multiple 4-element structures from four registers. This instruction stores multiple 4-element structures to memory from four SIMD&FP registers, with interleaving. Every element of each register is stored.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

```
|31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 12|11 10 9 | 5 4 | 0 |
|0 |Q|0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 |size| Rm | Rn | Rt |
```

Encoding

Decode for this encoding

```plaintext
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

```
|31 30 29 28|27 26 25 24|23 22 21 20|15 12|11 10 9 | 5 4 | 0 |
|0 |Q|0 0 1 1 0 0 1 0 0 |size| Rm | Rn | Rt |
```

Immediate offset variant

Applies when Rm == 11111.

ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [ <Xn>|SP> ], <imm>

Register offset variant

Applies when Rm != 11111.

ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [ <Xn>|SP> ], <Xm>

Decode for all variants of this encoding

```plaintext
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

- `<Vt>` Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - 88 when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm> Is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
#32 when Q = 0
#64 when Q = 1
<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

**Operational information**

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
C7.2.329 STNP (SIMD&FP)

Store Pair of SIMD&FP registers, with Non-temporal hint. This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see Load/store SIMD and floating-point non-temporal pair on page C3-265.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean sub_op = (U == '1');

**Assembler symbols**

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
- D when size = 11

The following encodings are reserved:
- size = 0x.
• size = 10.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if sub_op then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = element1 + element2;
V[d, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.335  **SUBHN, SUBHN2**

Subtract returning High Narrow. This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values.

The results are truncated. For rounded results, see **RSUBHN, RSUBHN2**.

The **SUBHN** instruction writes the vector to the lower half of the destination register and clears the upper half, while the **SUBHN2** instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

![Instruction Encoding](image)

**Encoding**

SUBHN\{2\} <Vd>,<Vn>,<Ta>, <Vm>,<Ta>

**Decode for this encoding**

```plaintext

\quad \quad \text{sum} = \text{element1} + \text{element2} ; \\
\quad \quad \text{sum} = \text{sum} + \text{round\_const} ; \\
\quad \quad \text{Elem[result, e, esize]} = \text{sum<2*esize-1:esize>} ; \\
\]

\[ \text{Vpart[d, part, datasize]} = \text{result} ; \]

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.336  SUDOT (by element)

Dot product index form with signed and unsigned integers. This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination vector.

From Armv8.2 to Armv8.5, this is an optional instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

( FEAT_I8MM )

Encoding

SUDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.4B.<index>

Decode for this encoding

if !HaveInt8MatMulExt() then UNDEFINED;
boolean op1_unsigned = (US == '1');
boolean op2_unsigned = (US == '0');
n = UInt(Rn);
m = UInt(M:Rm);
d = UInt(Rd);
i = UInt(H:L);
datasize = if Q == '1' then 128 else 64;
elements = datasize DIV 32;

Assembler symbols

<Vd>  Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Ta>  Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
   2S when Q = 0
   4S when Q = 1
<Vn>  Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Tb>  Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
   8B when Q = 0
   16B when Q = 1
<Vm>  Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
<index>  Is the immediate index of a 32-bit group of four 8-bit values in the range 0 to 3, encoded in the "H:L" fields.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(128) operand2 = V[m, 128];
bits(datasize) operand3 = V[d, datasize];
bits(datasize) result;
for e = 0 to elements-1
    bits(32) res = Elem[operand3, e, 32];
    for b = 0 to 3
        integer element1 = Int(Elem[operand1, 4*e+b, 8], op1_unsigned);
        integer element2 = Int(Elem[operand2, 4*i+b, 8], op2_unsigned);
        res = res + element1 * element2;
    Elem[result, e, 32] = res;
V[d, datasize] = result;
C7.2.337  SUQADD

Signed saturating Accumulate of Unsigned value. This instruction adds the unsigned integer values of the vector elements in the source SIMD&FP register to corresponding signed integer values of the vector elements in the destination SIMD&FP register, and writes the resulting signed integer values to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

⟨V⟩  Is a width specifier, encoded in the "size" field. It can have the following values:
  B when size = 00
  H when size = 01
  S when size = 10
  D when size = 11

⟨d⟩  Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

⟨n⟩  Is the number of the SIMD&FP source register, encoded in the "Rn" field.

⟨Vd⟩ Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

⟨T⟩  Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  8B when size = 00, Q = 0
  16B when size = 00, Q = 1
  4H when size = 01, Q = 0
  8H when size = 01, Q = 1
  2S when size = 10, Q = 0
  4S when size = 10, Q = 1
  2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

⟨Vn⟩ Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

    CheckFPAdvSIMDEnabled64();
    bits(datasize) operand = V[n, datasize];
    bits(datasize) result;

    bits(datasize) operand2 = V[d, datasize];

    integer op2;
    boolean sat;

    for e = 0 to elements-1
        op1 = Int(Elem[operand, e, esize], !unsigned);
        op2 = Int(Elem[operand2, e, esize], unsigned);
        (Elem[result, e, esize], sat) = SatQ(op1 + op2, esize, unsigned);
        if sat then FPSR.QC = '1';
        V[d, datasize] = result;
C7.2.338  SXTL, SXTL2

Signed extend Long. This instruction duplicates each vector element in the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SXTL instruction extracts the source vector from the lower half of the source register. The SXTL2 instruction extracts the source vector from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the SSHLL, SSHLL2 instruction. This means that:

- The encodings in this description are named to match the encodings of SSHLL, SSHLL2.
- The description of SSHLL, SSHLL2 gives the operational pseudocode for this instruction.

![Encoding](image)

**Encoding**

SXTL[2]  \(<Vd>\cdot<Ta>, <Vn>\cdot<Tb>\)

is equivalent to

SSHLL[2]  \(<Vd>\cdot<Ta>, <Vn>\cdot<Tb>, #0\)

and is the preferred disassembly when BitCount(immh) == 1.

**Assembler symbols**

2  
Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd>  
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  
Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

- 8H when immh = 0001
- 4S when immh = 001x
- 2D when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vn>  
Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb>  
Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

- 8B when immh = 0001, Q = 0
- 16B when immh = 0001, Q = 1
- 4H when immh = 001x, Q = 0
- 8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1
See *Advanced SIMD modified immediate* on page C4-632 when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = x is reserved.

**Operation**

The description of **SSHLL, SSHLL2** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.339  TBL

Table vector Lookup. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the result for that lookup is 0. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Two register table variant
Applies when \( \text{len} == 01 \).

\[
\text{TBL} \ <Vd>.<Ta>, \ { <Vn>.16B, <Vn+1>.16B } , \ <Vm>.<Ta>

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
    — The values of the data supplied in any of its registers.
    — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
    — The values of the data supplied in any of its registers.
    — The values of the NZCV flags.
C7.2.341   TRN1

Transpose vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

--- Note ---

By using this instruction with TRN2, a 2 x 2 matrix can be transposed.

The following figure shows the operation of TRN1 and TRN2 halfword operations where Q = 0.

TRN1.16

\[
\begin{array}{c}
\text{Vn} \\
3 & 2 & 1 & 0 \\
\text{Vd} \\
\text{Vm}
\end{array}
\]

TRN2.16

\[
\begin{array}{c}
\text{Vn} \\
3 & 2 & 1 & 0 \\
\text{Vd} \\
\text{Vm}
\end{array}
\]

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

TRN1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```cpp
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - 8B when size = 00, Q = 0
  - 16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;

for p = 0 to pairs-1
    Elem[result, 2*p+0, esize] = Elem[operand1, 2*p+part, esize];
    Elem[result, 2*p+1, esize] = Elem[operand2, 2*p+part, esize];

V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

boolean accumulate = (ac == '1');

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
   8B when size = 00, Q = 0
   16B when size = 00, Q = 1
   4H when size = 01, Q = 0
   8H when size = 01, Q = 1
   2S when size = 10, Q = 0
   4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer element1;
integer element2;
bias(esize) absdiff;
result = if accumulate then V[d, datasize] else Zeros(datasize);
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  absdiff = Abs(element1-element2)<esize-1:0>;
  Elem[result, e, esize] = Elem[result, e, esize] + absdiff;
V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.344  UABAL, UABAL2

Unsigned Absolute difference and Accumulate Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UABAL instruction extracts each source vector from the lower half of each source register. The UABAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
[31 30 29 28] [27 26 25 24] [23 22 21 20] [16] [15 14 13] [12] [11 10 9] [5] [4] [3] [2] [1] [0]

0 Q 1 0 1 1 0 | size 1 | Rm 0 1 0 1 0 0 | Rn Rd
```

**Encoding**

UABAL[2] <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

**Decode for this encoding**

```java
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean accumulate = (op == '0');
boolean unsigned = (U == '1');
```

**Assembler symbols**

2  
Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd>  
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  
Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
- 4S when size = 01
- 2D when size = 10

The encoding size = 11 is reserved.

<Vn>  
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```c
CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = Vpart[n, part, datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;

- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n, 2*datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, 2*esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;
V[d, 2*datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.352  UCVTF (vector, fixed-point)

Unsigned fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Assembler symbols

<V> Is a width specifier, encoded in the "immm" field. It can have the following values:

H when immh = 001x
S when immh = 01xx
D when immh = 1xxx

The encoding immh = 000x is reserved.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

</d> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "immm:Q" field. It can have the following values:

4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1
2D when immh = 1xxx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.

The following encodings are reserved:

- immh = 0001, Q = x.
- immh = 1xxx, Q = x.

</n> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<fbits> For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded in the "immm:immb" field. It can have the following values:

(32-Uint(immm:immb)) when immh = 001x
(64-Uint(immm:immb)) when immh = 01xx
(128-Uint(immm:immb)) when immh = 1xxx

The encoding immh = 000x is reserved.

For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded in the "immm:immb" field. It can have the following values:

(32-Uint(immm:immb)) when immh = 001x
(64-Uint(immm:immb)) when immh = 01xx
(128-Uint(immm:immb)) when immh = 1xxx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

The encoding immh = 0001 is reserved.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];

bits(size) element;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d, 128] else Zeros(128);

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FixedToFP(element, fracbits, unsigned, fpcr, rounding, esize);
V[d, 128] = result;
C7.2.353  UCVTF (vector, integer)

Unsigned integer Convert to Floating-point (vector). This instruction converts each element in a vector from an unsigned integer value to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page A1-64.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

V[d, fsize] = fltval;
C7.2.356   UDOT (by element)

Dot Product unsigned arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

______ Note ________
ID_AA64ISAR0_EL1.DP indicates whether this instruction is supported.

    Elem[result, e, esize] = Elem[result, e, esize] + res;
  V[d, datasize] = result;
C7.2.358   UHADD

Unsigned Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see URHADD.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Decode for this encoding

```java
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - `8B` when size = 00, Q = 0
  - `16B` when size = 00, Q = 1
  - `4H` when size = 01, Q = 0
  - `8H` when size = 01, Q = 1
  - `2S` when size = 10, Q = 0
  - `4S` when size = 10, Q = 1
  The encoding size = 11, Q = x is reserved.
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```java
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
```
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    sum = (element1 + element2) >> 1;
    Elem[result, e, esize] = sum<esize-1:0>;
V[d, datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.359 UHSUB

Unsigned Halving Subtract. This instruction subtracts the vector elements in the second source SIMD&FP register from the corresponding vector elements in the first source SIMD&FP register, shifts each result right one bit, places each result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

```
UHSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.366  **UMLAL, UMLAL2 (by element)**

Unsigned Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register. The UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Encoding

UMLAL\{2\} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

### Decode for this encoding

```plaintext
integer idxdsiz = if \texttt{H} == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
  when '01' index = UInt(H:L:M); Rmhi = '0';
  when '10' index = UInt(H:L); Rmhi = M;
  otherwise UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
```

### Assembler symbols

- **Z**  
  Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
  - [absent] when \texttt{Q} = 0
  - [present] when \texttt{Q} = 1

- **<Vd>**  
  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- **<Ta>**  
  Is an arrangement specifier, encoded in the "size" field. It can have the following values:
  - 4S when \texttt{size} = 01
  - 2D when \texttt{size} = 10
The following encodings are reserved:
- size = 00.
- size = 11.

\(<Vn>\) Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\(<Tb>\) Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The following encodings are reserved:
- size = 00, Q = x.
- size = 11, Q = x.

\(<Vm>\) Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

\(<Ts>\) Is an element size specifier, encoded in the "size" field. It can have the following values:
- H when size = 01
- S when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

\(<index>\) Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(idxdsize) operand2 = V[m, idxdsize];
bits(2*datasize) operand3 = V[d, 2*datasize];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<<2*esize-1:0>;
```
if sub_op then
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] - product;
else
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] + product;
V[d, 2*datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.367  UMLAL, UMLAL2 (vector)

Unsigned Multiply-Add Long (vector). This instruction multiplies the vector elements in the lower or upper half of the first source SIMD&FP register by the corresponding vector elements of the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register. The UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMLAL\{2\} \langle Vd\rangle, \langle Ta\rangle, \langle Vn\rangle, \langle Tb\rangle, \langle Vm\rangle, \langle Tb\rangle

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');

Assembler symbols

2  Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
   [absent]  when Q = 0
   [present]  when Q = 1

\langle Vd\rangle  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\langle Ta\rangle  Is an arrangement specifier, encoded in the "size" field. It can have the following values:
   8H  when size = 00
   4S  when size = 01
   2D  when size = 10

The encoding size = 11 is reserved.

\langle Vn\rangle  Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\langle Tb\rangle  Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
   8B  when size = 00, Q = 0
   16B when size = 00, Q = 1
4H  
8H  
2S  
4S  
The encoding size = 11, Q = x is reserved.

<\m>  Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

- `CheckFPAdvSIMDEnabled64();`
- `bits(datasize) operand1 = Vpart[n, part, datasize];`
- `bits(datasize) operand2 = Vpart[m, part, datasize];`
- `bits(2*datasize) operand3 = V[d, 2*datasize];`
- `bits(2*datasize) result;`
- `integer element1;`
- `integer element2;`
- `bits(2*esize) product;`
- `bits(2*esize) accum;`

```
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    if sub_op then
        accum = Elem[operand3, e, 2*esize] - product;
    else
        accum = Elem[operand3, e, 2*esize] + product;
    Elem[result, e, 2*esize] = accum;
V[d, 2*datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.368  UMLSL, UMLSL2 (by element)

Unsigned Multiply-Subtract Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLSL instruction extracts vector elements from the lower half of the first source register. The UMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMLSL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
  when '01' index = UInt(H:L:M); Rmhi = '0';
  when '10' index = UInt(H:L); Rmhi = M;
  otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');

Assembler symbols

2  Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
  [absent]  when Q = 0
  [present]  when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
  4S  when size = 01
  2D  when size = 10
The following encodings are reserved:
- size = 00.
- size = 11.

\(<Vn>\) Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\(<Tb>\) Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The following encodings are reserved:
- size = 00, Q = x.
- size = 11, Q = x.

\(<Vm>\) Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

Restricted to V0-V15 when element size \(<Ts>\) is H.

\(<Ts>\) Is an element size specifier, encoded in the "size" field. It can have the following values:
- H when size = 01
- S when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

\(<index>\) Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:
- size = 00.
- size = 11.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(idxdsize) operand2 = V[m, idxdsize];
bits(2*datasize) operand3 = V[d, 2*datasize];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  product += (element1*element2)<2*esize-1:0>;
```
if sub_op then
    Elem[result, e, 2*size] = Elem[operand3, e, 2*size] - product;
else
    Elem[result, e, 2*size] = Elem[operand3, e, 2*size] + product;

V[d, 2*datasize] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.369  **UMLSL, UMLSL2 (vector)**

Unsigned Multiply-Subtract Long (vector). This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The **UMLSL** instruction extracts each source vector from the lower half of each source register. The **UMLSL2** instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.370   UMMLA (vector)

Unsigned 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an optional instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

(_FEAT_I8MM)

Encoding

UMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

Decode for this encoding

if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);

Assembler symbols

<Vd>        Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Vn>        Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>        Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n, 128];
bits(128) operand2 = V[m, 128];
bits(128) addend = V[d, 128];
V[d, 128] = MatMulAdd(addend, operand1, operand2, TRUE, TRUE);
C7.2.371 UMOV

Unsigned Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (to general). See Alias conditions for details of when each alias is preferred.

### 32-bit variant

Applies when \( Q == 0 \).

\[
\text{UMOV} \ <Wd>, \ <Vn>.<Ts>[<index>]
\]

### 64-bit variant

Applies when \( Q == 1 \) \&\& \( \text{imm5} == \text{x1000} \).

\[
\text{UMOV} \ <Xd>, \ <Vn>.<Ts>[<index>]
\]

**Decode for all variants of this encoding**

\[
\text{integer } d = \text{UInt}(Rd);
\text{integer } n = \text{UInt}(Rn);
\]

\[
\text{integer } size;
\text{case } \text{Q:imm5 of}
\text{when '0xxxx1' size = 0; \ // UMOV Wd, Vn.B}
\text{when '0xxx10' size = 1; \ // UMOV Wd, Vn.H}
\text{when '0xx100' size = 2; \ // UMOV Wd, Vn.S}
\text{when '1x1000' size = 3; \ // UMOV Xd, Vn.D}
\text{otherwise UNDEFINED;}
\]

\[
\text{integer idxdsize = if } \text{imm5<4> == '1' then 128 else 64;}
\text{integer index = UInt(imm5<4:size+1>);}
\text{integer esize = 8 << size;}
\text{integer datasize = if } Q == '1' \text{ then 64 else 32;}
\]

**Alias conditions**

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOV (to general)</td>
<td>( \text{imm5} == \text{'x1000'} )</td>
</tr>
<tr>
<td>MOV (to general)</td>
<td>( \text{imm5} == \text{'xx100'} )</td>
</tr>
</tbody>
</table>

**Assembler symbols**

\[
<Wd>
\]

Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ts> For the 32-bit variant: is an element size specifier, encoded in the "imm5" field. It can have the following values:

- B when \( \text{imm5} = xxxx1 \)
- H when \( \text{imm5} = xxx10 \)
- S when \( \text{imm5} = xx100 \)

The encoding \( \text{imm5} = xx000 \) is reserved.

For the 64-bit variant: is an element size specifier, encoded in the "imm5" field. It can have the following values:

- D when \( \text{imm5} = x1000 \)

The following encodings are reserved:

- \( \text{imm5} = x0000 \).
- \( \text{imm5} = xxxx1 \).
- \( \text{imm5} = xxx10 \).
- \( \text{imm5} = xx100 \).

<index> For the 32-bit variant: is the element index encoded in the "imm5" field. It can have the following values:

- \( \text{imm5}<4:1> \) when \( \text{imm5} = xxxx1 \)
- \( \text{imm5}<4:2> \) when \( \text{imm5} = xxx10 \)
- \( \text{imm5}<4:3> \) when \( \text{imm5} = xx100 \)

The encoding \( \text{imm5} = xx000 \) is reserved.

For the 64-bit variant: is the element index encoded in "imm5<4>".

**Operation**

```plaintext
if index == 0 then
    CheckFPEnabled64();
else
    CheckFPAdvSIMDEnabled64();

bits(idxdsiz) operand = V[n, idxdsiz];

X[d, datasiz] = ZeroExtend(Elem[operand, index, esize], datasiz);
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.372  UMULL, UMULL2 (by element)

Unsigned Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMULL instruction extracts vector elements from the lower half of the first source register. The UMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
  when '01' index = UInt(H:L:M); Rmhi = '0';
  when '10' index = UInt(H:L); Rmhi = M;

integer m = UInt(Rmhi:Rm);
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');

Assembler symbols

2  Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
  [absent] when Q = 0
  [present] when Q = 1

<Vd>  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  Is an arrangement specifier, encoded in the "size" field. It can have the following values:
  4S  when size = 01
  2D  when size = 10
The following encodings are reserved:
  •  size = 00.
• size = 11.

\(<Vn>\)
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\(<Tb>\)
Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

\[ 4H \quad \text{when } size = 01, Q = 0 \]
\[ 8H \quad \text{when } size = 01, Q = 1 \]
\[ 2S \quad \text{when } size = 10, Q = 0 \]
\[ 4S \quad \text{when } size = 10, Q = 1 \]

The following encodings are reserved:

• size = 00, Q = x.
• size = 11, Q = x.

\(<Vm>\)
Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

\[ 0:Rm \quad \text{when } size = 01 \]
\[ M:Rm \quad \text{when } size = 10 \]

The following encodings are reserved:

• size = 00.
• size = 11.

Restricted to V0-V15 when element size \(<Ts>\) is H.

\(<Ts>\)
Is an element size specifier, encoded in the "size" field. It can have the following values:

\[ H \quad \text{when } size = 01 \]
\[ S \quad \text{when } size = 10 \]

The following encodings are reserved:

• size = 00.
• size = 11.

\(<index>\)
Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

\[ H:L:M \quad \text{when } size = 01 \]
\[ H:L \quad \text{when } size = 10 \]

The following encodings are reserved:

• size = 00.
• size = 11.

### Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(idxdsize) operand2 = V[m, idxdsize];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  product = (element1*element2)<2*esize-1:0>;
  Elem[result, e, 2*esize] = product;

V[d, 2*datasize] = result;
```
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.373 UMULL, UMULL2 (vector)

Unsigned Multiply long (vector). This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, places the result in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The UMULL instruction extracts each source vector from the lower half of each source register. The UMULL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);

V[d, 2*datasize] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.374  UQADD

Unsigned saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.375  **UQRSHL**

Unsigned saturating Rounding Shift Left (register). This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see UQSHL (immediate).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.376 UQRSHRN, UQRSHRN2

Unsigned saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see UQSHRN, UQSHRN2.

The UQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

2
Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd>
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<7b>
Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0
16B when immh = 0001, Q = 1
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

<Vn>
Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<7a>
Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when immh = 0001
4S when immh = 001x
2D when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vb>
Is the destination width specifier, encoded in the "immh" field. It can have the following values:

B when immh = 0001
H when immh = 001x
S when immh = 01xx

The following encodings are reserved:

• immh = 0000.
• immh = 1xxx.

<d>
Is the number of the SIMD&FP destination register, in the "Rd" field.

<Va>
Is the source width specifier, encoded in the "immh" field. It can have the following values:

H when immh = 0001
S when immh = 001x
D when immh = 01xx
The following encodings are reserved:
- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

\(<n>\) is the number of the first SIMD&FP source register, encoded in the "Rn" field.

\(<\text{shift}>\) For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:
- \(16\text{-UInt}(\text{immh:immb})\) when \(\text{immh} = 0001\)
- \(32\text{-UInt}(\text{immh:immb})\) when \(\text{immh} = 001x\)
- \(64\text{-UInt}(\text{immh:immb})\) when \(\text{immh} = 01xx\)

The following encodings are reserved:
- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- \(16\text{-UInt}(\text{immh:immb})\) when \(\text{immh} = 0001\)
- \(32\text{-UInt}(\text{immh:immb})\) when \(\text{immh} = 001x\)
- \(64\text{-UInt}(\text{immh:immb})\) when \(\text{immh} = 01xx\)

See Advanced SIMD modified immediate on page C4-632 when \(\text{immh} = 0000\).

The encoding \(\text{immh} = 1xxx\) is reserved.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n, datasize*2];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;

V[d, datasize] = result;
C7.2.379  UQSHRN, UQSHRN2

Unsigned saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see UQRSHRN, UQRSHRN2.

The UQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<tr>
<td>4H</td>
<td>immh = 001x, Q = 0</td>
</tr>
<tr>
<td>8H</td>
<td>immh = 001x, Q = 1</td>
</tr>
<tr>
<td>2S</td>
<td>immh = 01xx, Q = 0</td>
</tr>
<tr>
<td>4S</td>
<td>immh = 01xx, Q = 1</td>
</tr>
</tbody>
</table>

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>8H</td>
<td>immh = 0001</td>
</tr>
<tr>
<td>4S</td>
<td>immh = 001x</td>
</tr>
<tr>
<td>2D</td>
<td>immh = 01xx</td>
</tr>
</tbody>
</table>

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vb> Is the destination width specifier, encoded in the "immh" field. It can have the following values:

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>immh = 0001</td>
</tr>
<tr>
<td>H</td>
<td>immh = 001x</td>
</tr>
<tr>
<td>S</td>
<td>immh = 01xx</td>
</tr>
</tbody>
</table>

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>H</td>
<td>immh = 0001</td>
</tr>
<tr>
<td>S</td>
<td>immh = 001x</td>
</tr>
<tr>
<td>D</td>
<td>immh = 01xx</td>
</tr>
</tbody>
</table>
The following encodings are reserved:

- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

\(<n>\)  

Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

\(<\text{shift}>\)  

For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

\( (16-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 0001 \)
\( (32-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 001x \)
\( (64-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 01xx \)

The following encodings are reserved:

- \( \text{immh} = 0000 \).
- \( \text{immh} = 1xxx \).

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

\( (16-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 0001 \)
\( (32-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 001x \)
\( (64-\text{UInt}(\text{immh}:\text{immb})) \) when \( \text{immh} = 01xx \)

See Advanced SIMD modified immediate on page C4-632 when \( \text{immh} = 0000 \).

The encoding \( \text{immh} = 1xxx \) is reserved.

Operation for all encodings

```c
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n, datasize*2];
bias(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;
for e = 0 to elements-1
  element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
  (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
  if sat then FPSR.QC = '1';
Vpart[d, part, datasize] = result;
```
C7.2.380 UQSUB

Unsigned saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

   H when size = 00
   S when size = 01
   D when size = 10
   The encoding size = 11 is reserved.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n, 2*datasize];
bits(datasize) result;
bits(2*esize) element;
boolean sat;
for e = 0 to elements-1
    element = Elem[operand, e, 2*esize];
    (Elem[result, e, esize], sat) = SatQ(Int(element, unsigned), esize, unsigned);
    if sat then FPSR.QC = '1';

    Vpart[d, part, datasize] = result;
C7.2.382 URECPE

Unsigned Reciprocal Estimate. This instruction reads each vector element from the source SIMD&FP register, calculates an approximate inverse for the unsigned integer value, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

URECPE <Vd>.<T>, <Vn>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
if sz == '1' then UNDEFINED;
integer esize = 32;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
bits(32) element;
for e = 0 to elements-1
    element = Elem[operand, e, 32];
    Elem[result, e, 32] = UnsignedRecipEstimate(element);
V[d, datasize] = result;
C7.2.383 URHADD

Unsigned Rounding Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see UHADD.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

URHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  8B when size = 00, Q = 0
  16B when size = 00, Q = 1
  4H when size = 01, Q = 0
  8H when size = 01, Q = 1
  2S when size = 10, Q = 0
  4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  sum = (element1 + element2 + 1) >> 1;
  Elem[result, e, esize] = sum<esize-1:0>;

V[d, datasize] = result;
C7.2.384 URSHL

Unsigned Rounding Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

\langle V \rangle  
Is a width specifier, encoded in the "size" field. It can have the following values:

- 0  when size = 11

The following encodings are reserved:

- size = 0x.
- size = 10.

\langle d \rangle  
Is the number of the SIMD&FP destination register, in the "Rd" field.

\langle n \rangle  
Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

\langle m \rangle  
Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

\langle Vd \rangle  
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\langle T \rangle  
Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B  when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H  when size = 01, Q = 0
- 8H  when size = 01, Q = 1
- 2S  when size = 10, Q = 0
- 4S  when size = 10, Q = 1
- 2D  when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

\langle Vn \rangle  
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\langle Vm \rangle  
Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

\langle V \rangle[d, datasize] = result;
C7.2.385  URSHR

Unsigned Rounding Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see USHR.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.390  USHL

Unsigned Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see URSHL.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.391 USHLL, USHLL2

Unsigned Shift Left Long (immediate). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The USHLL instruction extracts vector elements from the lower half of the source register. The USHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias UXTL, UXTL2. See Alias conditions for details of when each alias is preferred.

| 0 | Q | 1 | 0 | 1 | 1 | 1 | 0 | !=0000 | immh | 1 | 0 | 1 | 0 | 1 | Rn | Rd |

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when immh = 0001
4S when immh = 001x
2D when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.
The encoding immh = 1xxx is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
8B when immh = 0001, Q = 0
16B when immh = 0001, Q = 1
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1

See Advanced SIMD modified immediate on page C4-632 when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = x is reserved.

<shift> Is the left shift amount, in the range 0 to the source element width in bits minus 1, encoded in the
"immh:immb" field. It can have the following values:
(UInt(immh:immb)-8) when immh = 0001
(UInt(immh:immb)-16) when immh = 001x
(UInt(immh:immb)-32) when immh = 01xx

See Advanced SIMD modified immediate on page C4-632 when immh = 0000.
The encoding immh = 1xxx is reserved.

Operation
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part, datasize];
bits(datasize*2) result;
integer element;
for e = 0 to elements-1
  element = Int(Elem[operand, e, esize], unsigned) << shift;
  Elem[result, e, 2*esize] = element<[2*esize-1:0]>
V[d, datasize*2] = result;

Operational information
If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.392 USHR

Unsigned Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see URSHR.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.393 USMMLA (vector)

Unsigned and signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

**Vector**

(FEAT_I8MM)

```
[31 30 29 28|27 26 25 24|23 22 21 20] 16|15 14 13 12|11 10 9 | 5 4 | 0 |
0 1 0 0 1 1 0 1 0 0 Rm 1 0 1 0 1 1 Rn Rd
```

**Encoding**

USMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

**Decode for this encoding**

```c
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

**Assembler symbols**

<Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n, 128];
bits(128) operand2 = V[m, 128];
bits(128) addend = V[d, 128];
V[d, 128] = MatMulAdd(addend, operand1, operand2, TRUE, FALSE);
```
C7.2.394   USQADD

Unsigned saturating Accumulate of Signed value. This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.396  USUBL, USUBL2

Unsigned Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The destination vector elements are twice as long as the source vector elements.

The USUBL instruction extracts each source vector from the lower half of each source register. The USUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.397  **USUBW, USUBW2**

Unsigned Subtract Wide. This instruction subtracts each vector element of the second source SIMD&FP register from the corresponding vector element in the lower or upper half of the first source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. All the values in this instruction are unsigned integer values.

The vector elements of the destination register and the first source register are twice as long as the vector elements of the second source register.

The **USUBW** instruction extracts vector elements from the lower half of the first source register. The **USUBW2** instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Encoding**

```
<table>
<thead>
<tr>
<th>[31 30 29 28][27 26 25 24][23 22 21 20]</th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Q</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

U   o1
```

**Decode for this encoding**

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

**Assembler symbols**

**2**  
Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

**<Vd>**  
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

**<Ta>**  
Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
- 4S when size = 01
- 2D when size = 10

The encoding size = 11 is reserved.

**<Vn>**  
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n, 2*datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, 2*esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;
V[d, 2*datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.398  UXTL, UXTL2

Unsigned extend Long. This instruction copies each vector element from the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The UXTL instruction extracts vector elements from the lower half of the source register. The UXTL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the USHLL, USHLL2 instruction. This means that:

- The encodings in this description are named to match the encodings of USHLL, USHLL2.
- The description of USHLL, USHLL2 gives the operational pseudocode for this instruction.

This instruction is an alias of the USHLL, USHLL2 instruction. This means that:
- The encodings in this description are named to match the encodings of USHLL, USHLL2.
- The description of USHLL, USHLL2 gives the operational pseudocode for this instruction.

Encoding

\[
\text{UXTL2} \quad <Vd>.<Ta>, <Vn>.<Tb>
\]

is equivalent to

\[
\text{USHLL2} \quad <Vd>.<Ta>, <Vn>.<Tb>, #0
\]

and is the preferred disassembly when \(\text{BitCount(immh)} = 1\).

| 8H when \(\text{immm} = 001x, Q = 1\) |
**Operation**

The description of **USHLL, USHLL2** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.399 UZP

Unzip vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

——— Note ————

This instruction can be used with UZP2 to de-interleave two vectors.

The following figure shows the operation of UZP1 and UZP2 with the arrangement specifier 8B.

![Operation of UZP1 and UZP2](image)

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Encoding

UZP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

### Decode for this encoding

```java
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
```

### Assembler symbols

- `<Vd>` is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - 8B when size = 00, Q = 0
  - 16B when size = 00, Q = 1
  - 4H when size = 01, Q = 0
  - 8H when size = 01, Q = 1
  - 2S when size = 10, Q = 0
  - 4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<\text{n}> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<\text{m}> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

\begin{verbatim}
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n, datasize];
bits(datasize) operandh = V[m, datasize];
bits(datasize) result;
bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];
V[d, datasize] = result;
\end{verbatim}

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.400 UZP2

Unzip vectors (secondary). This instruction reads corresponding odd-numbered vector elements from the two source SIMD&FP registers, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

--- Note ---

This instruction can be used with UZP1 to de-interleave two vectors.

The following figure shows the operation of UZP1 and UZP2 with the arrangement specifier 8B.

```
Vn  A7  A6  A5  A4  A3  A2  A1  A0
Vm  B7  B6  B5  B4  B3  B2  B1  B0
```

UZP1.8, doubleword

```
Vd  B7  B6  B5  B4  A6  A5  A3  A2
```

UZP2.8, doubleword

```
Vd  B7  B6  B5  B4  A7  A6  A3  A2
```

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

--- Encoding ---

UZP2 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

--- Decode for this encoding ---

```c
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
```

--- Assembler symbols ---

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - `8B` when size = 00, Q = 0
  - `16B` when size = 00, Q = 1
  - `4H` when size = 01, Q = 0
  - `8H` when size = 01, Q = 1
  - `2S` when size = 10, Q = 0
  - `4S` when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n, datasize];
bits(datasize) operandh = V[m, datasize];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];

V[d, datasize] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.401 XAR

Exclusive OR and Rotate performs a bitwise exclusive OR of the 128-bit vectors in the two source SIMD&FP registers, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when FEAT_SHA3 is implemented.

Advanced SIMD

(_FEAT_SHA3)

| [31 30 29 28]27 26 25 24|23 22 21 20] 16|15 | 10 9 | 5 4 | 0 |
|--------------------------|-----------------|-------|-------|-------|-------|-------|
| 1 1 0 0 1 1 1 0 1 0 0 | Rm | imm6 | Rn | Rd |

Encoding

XAR <Vd>.2D, <Vn>.2D, <Vm>.2D, #<imm6>

Decode for this encoding

if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
<imm6> Is a rotation right, encoded in "imm6".

Operation

AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m, 128];
bits(128) Vn = V[n, 128];
bits(128) tmp;
tmp = Vn EOR Vm;
V[d, 128] = ROR(tmp<127:64>, UInt(imm6)):ROR(tmp<63:0>, UInt(imm6));

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C7.2.402 XTN, XTN2

Extract Narrow. This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

The XTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the XTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9</th>

<td>size</td>
<td>1 0 0 0 0 1 0 1 0</td>
</tr>
</tbody>
</table>

**Encoding**

XTN{2} <Vd>, <Tb>, <Vn>, <Ta>

**Decode for this encoding**

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

**Assembler symbols**

2 is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd> is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
4S when size = 01
2D when size = 10

The encoding size = 11 is reserved.

Operation

CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n, 2*datasize];
bits(datasize) result;
bits(2*esize) element;

for e = 0 to elements-1
element = Elem[operand, e, 2*esize];
   Elem[result, e, esize] = element<esize-1:0>;
Vpart[d, part, datasize] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C7.2.403 ZIP1

Zip vectors (primary). This instruction reads adjacent vector elements from the lower half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

Note

This instruction can be used with ZIP2 to interleave two vectors.

The following figure shows the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

![Diagram of ZIP1 and ZIP2 operation]

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ZIP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```c
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler symbols

- `<Vd>`: Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>`: Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - `8B` when size = 00, Q = 0
  - `16B` when size = 00, Q = 1
  - `4H` when size = 01, Q = 0
  - `8H` when size = 01, Q = 1
  - `2S` when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

\(<Vn>\) is the name of the first SIMD&FP source register, encoded in the "Rn" field.

\(<Vm>\) is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

\[
\text{CheckFPAdvSIMDEnabled64}();
\text{bits}(\text{datasize}) \text{ operand1} = \text{V}[n, \text{datasize}];
\text{bits}(\text{datasize}) \text{ operand2} = \text{V}[m, \text{datasize}];

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

**Assembler symbols**

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- **8B** when size = 00, Q = 0
- **16B** when size = 00, Q = 1
- **4H** when size = 01, Q = 0
- **8H** when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer base = part * pairs;
for p = 0 to pairs-1
    Elem[result, 2*p+0, esize] = Elem[operand1, base+p, esize];
    Elem[result, 2*p+1, esize] = Elem[operand2, base+p, esize];
V[d, datasize] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Chapter C8
SVE Instruction Descriptions

This chapter describes the SVE instructions. It contains the following sections:

• About the SVE instructions on page C8-2974.
• Alphabetical list of SVE instructions on page C8-2975.
C8.1 About the SVE instructions

Alphabetical list of SVE instructions on page C8-2975 gives full descriptions of the SVE instructions that are in the following instruction groups:

- Loads and store instructions associated with the SVE registers.
- Data processing instructions with SVE registers.

A64 instruction set encoding on page C4-388 provides an overview of the instruction encodings as part of an instruction class within a functional group.

The SVE instructions include details relating to the Scalable Matrix Extension (SME), such as Streaming SVE mode and FEAT_SME. For more information, see, Arm® Architecture Reference Manual Supplement, The Scalable Matrix Extension (SME), for Armv9-A (ARM DDI 0616).
C8.2 Alphabetical list of SVE instructions

This section lists every section in the SVE category of the A64 instruction set. For details of the format used, see Structure of the A64 assembler language on page C1-228.
C8.2.1  ABS

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Encoding

ABS <Zd>.<T>, <Pg>/M, <Zn>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    integer element = SInt(Elem[operand, e, esize]);
    element = Abs(element);
    Elem[result, e, esize] = element<esize-1:0>;
Z[d, VL] = result;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.2 **ADCLB**

Add the even-numbered elements of the first source vector and the 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector to the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

**Encoding**

ADCLB `<Zda>.<T>, <Zn>.<T>, <Zm>.<T>

**Decode for this encoding**

if !HaveSVEZ() \&\& !HaveSME() then UNDEFINED;
constant integer esize = 32 << UInt(sz);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

**Assembler symbols**

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in the "sz" field. It can have the following values:

- S when sz = 0
- D when sz = 1

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

CheckSVEEnabled();
class integer VL = CurrentVL;
class integer pairs = VL DIV (esize \times 2);
bits(VL) operand = Z[n, VL];
bits(VL) carries = Z[m, VL];
bits(VL) result = Z[da, VL];

for \( p = 0 \) to pairs-1

bits(esize) element1 = Elem[result, 2*p + 0, esize];
bits(esize) element2 = Elem[operand, 2*p + 0, esize];
bits(esize) carry_in = Elem[carries, 2*p + 1, esize]<0>;

(res, nzcv) = AddWithCarry(element1, element2, carry_in);
carry_out = nzcv<1>;

Elem[result, 2*p + 0, esize] = res;
Elem[result, 2*p + 1, esize] = ZeroExtend(carry_out, esize);

Z[da, VL] = result;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.3   ADCLT

Add the odd-numbered elements of the first source vector and the 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector to the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

Encoding

ADCLT <Zda>.<T>, <Zn>.<T>, <Zm>.<T>

Decode for this encoding

if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32 << UInt(sz);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<T> Is the size specifier, encoded in the "sz" field. It can have the following values:
S when sz = 0
D when sz = 1

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer pairs = VL DIV (esize * 2);
bits(VL) operand = Z[n, VL];
bits(VL) carries = Z[m, VL];
bits(VL) result = Z[da, VL];
for p = 0 to pairs-1
  bits(esize) element1 = Elem[result, 2*p + 0, esize];
  bits(esize) element2 = Elem[operand, 2*p + 1, esize];
  bit carry_in = Elem[carries, 2*p + 1, esize]<0>;
  (res, nzcv) = AddWithCarry(element1, element2, carry_in);
  carry_out = nzcv<1>;
  Elem[result, 2*p + 0, esize] = res;
  Elem[result, 2*p + 1, esize] = ZeroExtend(carry_out, esize);
Z[da, VL] = result;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.4 ADD (immediate)

Add an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

```
| 31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|  | 5 4 | 0 |
| 0 0 1 0 0 1 0 1 | size | 1 0 0 0 0 0 1 1 | sh | imm8 | Zdn |
```

Encoding

ADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;

Assembler symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

B when size = 00
H when size = 01
S when size = 10
D when size = 11

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "sh" field. It can have the following values:

LSL #0 when sh = 0
LSL #8 when sh = 1

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
\[ \text{Elem}[\text{result}, e, \text{esize}] = \text{element1} + \text{imm}; \]

\[ Z[dn, VL] = \text{result}; \]

**Operational information**

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.5 ADD (vectors, predicated)

Add active elements of the second source vector to corresponding elements of the first source vector and
destructively place the results in the corresponding elements of the first source vector. Inactive elements in the
destination vector register remain unmodified.

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12| 10 9 | 5 4 | 0 ]
0 0 0 0 0 1 0 0 | 0 0 0 0 0 0 0 0 | Pg | Zm | Zdn
```

**Encoding**

ADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

**Decode for this encoding**

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);

**Assembler symbols**

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P\[g, PL\];
bits(VL) operand1 = Z\[dn, VL\];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z\[m, VL\] else Zeros(VL);
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem\[operand1, e, esize\];
bits(esize) element2 = Elem\[operand2, e, esize\];
  if Elem\[mask, e, esize\] == '1' then
    Elem\[result, e, esize\] = element1 + element2;
  else
    Elem\[result, e, esize\] = Elem\[operand1, e, esize\];
Z\[dn, VL\] = result;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.6 ADD (vectors, unpredicated)

Add all elements of the second source vector to corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
<table>

  bits(esize) element1 = Elem[operand1, e, esize];
  bits(esize) element2 = Elem[operand2, e, esize];
  Elem[result, e, esize] = element1 + element2;
Z[d, VL] = result;
```

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.7 ADDHNB

Add each vector element of the first source vector to the corresponding vector element of the second source vector, and place the most significant half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

Encoding

ADDHNB <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>

Decode for this encoding

if !HaveSVE2() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in the "size" field. It can have the following values:
  B when size = 01
  H when size = 10
  S when size = 11
  The encoding size = 00 is reserved.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Tb> Is the size specifier, encoded in the "size" field. It can have the following values:
  H when size = 01
  S when size = 10
  D when size = 11
  The encoding size = 00 is reserved.
<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;
constant integer halfesize = esize DIV 2;
for e = 0 to elements-1

  integer element2 = UInt(Elem[operand2, e, esize]);
  integer res = (element1 + element2) >> halfesize;
\begin{align*}
\text{Elem}[\text{result}, 2\times e + 0, \text{halfesize}] &= \text{res}_h<\text{halfesize}-1:0>; \\
\text{Elem}[\text{result}, 2\times e + 1, \text{halfesize}] &= \text{Zeros}(\text{halfesize}); \\
\text{Z}[d, \text{VL}] &= \text{result};
\end{align*}

\textbf{Operational information}

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.8 ADDHNT

Add each vector element of the first source vector to the corresponding vector element of the second source vector, and place the most significant half of the result in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. This instruction is unpredicated.

Encoding

ADDHNT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>

Decode for this encoding

if !HaveSVE2() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in the "size" field. It can have the following values:
B when size = 01
H when size = 10
S when size = 11
The encoding size = 00 is reserved.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in the "size" field. It can have the following values:
H when size = 01
S when size = 10
D when size = 11
The encoding size = 00 is reserved.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result = Z[d, VL];
constant integer halfesize = esize DIV 2;
for e = 0 to elements-1
  integer element1 = UInt(Elem[operand1, e, esize]);
integer element2 = UInt(Elem[operand2, e, esize]);
integer res = (element1 + element2) >> halfesize;
Elem[result, 2*e + 1, halfesize] = res<halfesize-1:0>;
Z[d, VL] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.9   ADDP

Add pairs of adjacent elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector.

Encoding

ADDP <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

Decode for this encoding

if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer m = UInt(Zm);
integer dn = UInt(Zdn);

Assembler symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

B when size = 00
H when size = 01
S when size = 10
D when size = 11

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) result;
integer element1;
integer element2;

      element1 = UInt(Elem[operand1, e + 0, esize]);
      element2 = UInt(Elem[operand1, e + 1, esize]);
    else
      element1 = UInt(Elem[operand2, e - 1, esize]);
      element2 = UInt(Elem[operand2, e + 0, esize]);

integer res = element1 + element2;
Elem[result, e, esize] = res<esize-1:0>;
Z[dn, VL] = result;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.

• The MOVPRFX instruction must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.10  ADDPL

Add the current predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and place the result in the 64-bit destination general-purpose register or current stack pointer.

| 31 30 29 28| 27 26 25 24| 23 22 21 20 | 16|15|14|13|12|11|10 | 5 | 4 | 0 |
|------------|------------|--------------|----|----|----|----|----|----|----|----|----|
| 0 0 0 0 0 | 1 0 0 0 1 | 1 0 1 0 0 | imm6 | Rd |

**Encoding**

ADDPL <Xd|SP>, <Xn|SP>, #<imm>

**Decode for this encoding**

if !HaveSVE() && !HaveSME() then UNDEFINED;
integer n = UInt(Rn);
integer d = UInt(Rd);
integer imm = SInt(imm6);

**Assembler symbols**

<Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<imm> Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

**Operation**

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;

bits(64) result = operand1 + (imm * (PL DIV 8));
if d == 31 then
    SP[] = result;
else
    X[d, 64] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.11 ADDVL

Add the current vector register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer, and place the result in the 64-bit destination general-purpose register or current stack pointer.

Encoding

ADDVL <Xd|SP>, <Xn|SP>, #<imm>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;

integer n = UInt(Rn);
integer d = UInt(Rd);
integer imm = SInt(imm6);

Assembler symbols

<Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<imm> Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(64) operand1 = if n == 31 then SP[] else X[n, 64];
bits(64) result = operand1 + (imm * (VL DIV 8));
if d == 31 then
    SP[] = result;
else
    X[d, 64] = result;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.12   ADR

Optionally sign or zero-extend the least significant 32-bits of each element from a vector of offsets or indices in the second source vector, scale each index by 2, 4 or 8, add to a vector of base addresses from the first source vector, and place the resulting addresses in the destination vector. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

\]
Z[dn, VL] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.18   AND (predicates)

Bitwise AND active elements of the second source predicate with corresponding elements of the first source
predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the
destination predicate register are set to zero. Does not set the condition flags.

This instruction is used by the alias MOV (predicate, predicated, zeroing). See Alias conditions for details of when
each alias is preferred.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 16 15 14 13 10 9 8 5 4 3 0 |

  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.20 AND (vectors, unpredicated)

Bitwise AND all elements of the second source vector with corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
[31 30 29 28|27 26 25 24|23 22 21 20] 16|15 14 13 12|11 10 9 | 5 4 | 0 |
0 0 0 0 1 0 0 0 0 1 | Zm 0 0 1 1 0 0 | Zn | Zd
```

**Encoding**

AND <Zd>.D, <Zn>.D, <Zm>.D

**Decode for this encoding**

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

**Assembler symbols**

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
Z[d, VL] = operand1 AND operand2;
```

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**C8.2.21 ANDS**

Bitwise AND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the alias MOVS (predicated). See *Alias conditions* for details of when each alias is preferred.

**Encoding**

\[
\begin{array}{cccccc}
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 14 | 13 & 10 | 9 | 8 | 5 | 4 | 3 | 0 \\
\hline
\begin{array}{c}
0 \quad 0 \quad 1 \quad 0 \quad 1 \quad 0 \quad 1 \quad 0 \quad 1 \quad 0 \quad 1 \quad 0 \\
\end{array}
\begin{array}{c}
Pm \\
Pg \\
Pn \\
Pd
\end{array}
\end{array}
\]

**Decode for this encoding**

- if !HaveSVE() \&\& !HaveSME() then UNDEFINED;
- constant integer esize = 8;
- integer g = UInt(Pg);
- integer n = UInt(Pn);
- integer m = UInt(Pm);
- integer d = UInt(Pd);
- boolean setflags = TRUE;

**Alias conditions**

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOVS (predicated)</td>
<td>S == '1' &amp;&amp; Pn == Pm</td>
</tr>
</tbody>
</table>

**Assembler symbols**

- `<Pd>` Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<Pg>` Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<Pn>` Is the name of the first source scalable predicate register, encoded in the "Pn" field.
- `<Pm>` Is the name of the second source scalable predicate register, encoded in the "Pm" field.

**Operation**

- `CheckSVEEnabled();`
- constant integer VL = CurrentVL;
- constant integer PL = VL DIV 8;
- constant integer elements = VL DIV esize;
- bits(PL) mask = P[g, PL];
- bits(PL) operand1 = P[n, PL];
- bits(PL) operand2 = P[m, PL];
- bits(PL) result;
- for e = 0 to elements-1
  - bit element1 = ElemP[operand1, e, esize];
bit element2 = ElemP[operand2, e, esize];
if ElemP[mask, e, esize] == '1' then
    ElemP[result, e, esize] = element1 AND element2;
else
    ElemP[result, e, esize] = '0';

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d, PL] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the NZCV condition flags written by this instruction might be significantly delayed.
C8.2.22 ANDV

Bitwise AND horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as all ones.

Encoding

ANDV <V><d>, <Pg>, <Zn>.<T>

Decode for this encoding

if !HaveSVE() & & !HaveSME() then UNDEFINED;
constant integer esize = 8 $<<$ UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Vd);

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
   B when size = 00
   H when size = 01
   S when size = 10
   D when size = 11

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:
   B when size = 00
   H when size = 01
   S when size = 10
   D when size = 11

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(esize) result = Ones(esize);
for e = 0 to elements-1
   if Elem[mask, e, esize] == '1' then
      result = result AND Elem[operand, e, esize];
\[ V[d, esize] = \text{result}; \]

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
C8.2.23 ASR (immediate, predicated)

Shift right by immediate, preserving the sign bit, each active element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. Inactive elements in the destination vector register remain unmodified.

Encoding

```
<Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
```

```
bits(4) tsize = tszh:tszl;
integer esize;
```

```
case tsize of
when '0000' UNDEFINED;
when '0001' esize = 8;
when '001x' esize = 16;
when '01xx' esize = 32;
when '1xxx' esize = 64;
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer shift = (2 * esize) - UInt(tsize:imm3);
```

Assembler symbols

- `<Zdn>` is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in the "tszh:tszl" field. It can have the following values:
  - B when tszh = 00, tszl = 01
  - H when tszh = 00, tszl = 1x
  - S when tszh = 01, tszl = xx
  - D when tszh = 1x, tszl = xx
- The encoding tszh = 00, tszl = 00 is reserved.
- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<const>` is the immediate shift amount, in the range 1 to number of bits per element, encoded in "tsz:imm3".

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer PL = VL DIV 8;
bits(VL) operand1 = Z[dn, VL];
bits(PL) mask = P[g, PL];
bits(VL) result;
```

```
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  if Elem[mask, e, esize] == '1' then
```

Elem[result, e, esize] = ASR(element1, shift);
else
    Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn, VL] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.24 ASR (immediate, unpredicated)

Shift right by immediate, preserving the sign bit, each element of the source vector, and place the results in the corresponding elements of the destination vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

Encoding

ASR <Zd>.<T>, <Zn>.<T>, #<const>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
bits(4) tsize = tszh:tszl;
integer esize;
case tsize of
  when '0000' UNDEFINED;

    Elem[result, e, esize] = ASR(element2, shift);
else
    Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn, VL] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.30 BCAX

Bitwise AND elements of the second source vector with the corresponding inverted elements of the third source vector, then exclusive OR the results with corresponding elements of the first source vector. The final results are destructively placed in the corresponding elements of the destination and first source vector. This instruction is unpredicated.

Encoding

Decode for this encoding

if !HaveSVE2() && !HaveSME() then UNDEFINED;
integer m = UInt(Zm);
integer k = UInt(Zk);
integer dn = UInt(Zdn);

Assembler symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zk> Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) operand3 = Z[k, VL];
Z[dn, VL] = operand1 EOR (operand2 AND NOT(operand3));

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.31 BDEP

This instruction scatters the lowest-numbered contiguous bits within each element of the first source vector to the bit positions indicated by non-zero bits in the corresponding mask element of the second source vector, preserving their order, and set the bits corresponding to a zero mask bit to zero. This instruction is unpredicated.

ID_AA64ZFR0_EL1.BitPerm indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

```
C8.2.35 **BFDOT (indexed)**

If FEAT_EBF16 is not implemented or FPCR.EBF is 0, irrespective of the other control bits in the FPCR, this instruction:

- Performs an unfused sum-of-products of each pair of adjacent BFloat16 elements in the first source vector with the specified pair of elements in the second vector. The intermediate single-precision products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the first source vector.
- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.
- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.
- Generates only the Default NaN, as if FPCR.DN is 1.

If FEAT_EBF16 is implemented and FPCR.EBF is 1, then this instruction:

- Performs a fused sum-of-products of each pair of adjacent BFloat16 elements in the first source vector with the specified pair of elements in the second vector. The intermediate single-precision products are not rounded before they are summed, but the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the first source vector.
- Generates only the default NaN, as if FPCR.DN is 1.
- Follows all other floating-point behaviors that apply to single-precision arithmetic, as controlled by the effective value of the FPCR in the current execution mode, and captured in the FPSR.

The BFloat16 pairs within the second source vector are specified using an immediate index which selects the same BFloat16 pair position within each 128-bit vector segment. The index range is from 0 to 3.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

    bits(16) element2 = Elem[operand2, s, 16];
    bits(32) element3 = Elem[operand3, e, 32];
    Elem[result, e, 32] = BFMulAddH(element3, element1, element2, FPCR[1]);
Z[da, VL] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.40 BFMLALT (vectors)

This BFloat16 floating-point multiply-add long instruction widens the odd-numbered BFloat16 elements in the first source vector and the corresponding elements in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the single-precision elements of the destination vector that overlap with the corresponding BFloat16 elements in the source vectors. This instruction is unpredicated.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

    bits(16) element1 = Elem[operand1, 2 * e + 1, 16];
    bits(16) element2 = Elem[operand2, 2 * e + 1, 16];
    bits(32) element3 = Elem[operand3, e, 32];
    Elem[result, e, 32] = BFMulAddH(element3, element1, element2, FPCR[]);
Z[da, VL] = result;
```
**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.41   BFMMLA

If FEAT_EBF16 is not implemented or FPCR.EBF is 0, irrespective of the other control bits in the FPCR, this instruction:

- Performs two unfused sums-of-products within each two pairs of adjacent BFloat16 elements while multiplying the 2×4 matrix of BFloat16 values held in each 128-bit segment of the first source vector by the 4×2 matrix of BFloat16 values in the corresponding segment of the second source vector. The intermediate single-precision products are rounded before they are summed and the intermediate sum is rounded before accumulation into the 2×2 single-precision matrix in the corresponding segment of the destination vector. This is equivalent to accumulating two 2-way unfused dot products per destination element.

- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.

- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).

- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.

- Generates only the Default NaN, as if FPCR.DN is 1.

If FEAT_EBF16 is implemented and FPCR.EBF is 1, then this instruction:

- Performs two fused sums-of-products within each two pairs of adjacent BFloat16 elements while multiplying the 2×4 matrix of BFloat16 values held in each 128-bit segment of the first source vector by the 4×2 matrix of BFloat16 values in the corresponding segment of the second source vector. The intermediate single-precision products are not rounded before they are summed, but the intermediate sum is rounded before accumulation into the 2×2 single-precision matrix in the corresponding segment of the destination vector. This is equivalent to accumulating two 2-way fused dot products per destination element.

- Generates only the default NaN, as if FPCR.DN is 1.

- Follows all other floating-point behaviors that apply to single-precision arithmetic, as controlled by the effective value of the FPCR in the current execution mode, and captured in the FPSR.

This instruction is unpredicated and vector length agnostic.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

if !HaveSVE() || !HaveSVE2BitPerm() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:
B when size = 00
H when size = 01
S when size = 10
D when size = 11

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) data = Z[n, VL];
bits(VL) mask = Z[m, VL];
bits(VL) result;

for e = 0 to elements - 1
   Elem[result, e, esize] = BitGroup(Elem[data, e, esize], Elem[mask, e, esize]);

Z[d, VL] = result;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.43  **BIC (immediate)**

Bitwise clear bits using immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is a pseudo-instruction of the **AND (immediate)** instruction. This means that:

- The encodings in this description are named to match the encodings of **AND (immediate)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **AND (immediate)** gives the operational pseudocode for this instruction.

\[
\begin{array}{ccccccccccccc}
31 & 30 & 29 & 28 & 27 & 26 & 25 & 24 & 23 & 22 & 21 & 20 & 19 & 18 & 17 & 5 & 4 & 0 \\
\hline
0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & \text{imm13} & \text{Zdn} \\
\end{array}
\]

**Encoding**

BIC \(<\text{Zdn}.<\text{T}>, \ <\text{Zdn}.<\text{T}>, \ #<\text{const}>\)

is equivalent to

AND \(<\text{Zdn}.<\text{T}>, \ <\text{Zdn}.<\text{T}>, \ #(1-<\text{const}> - 1)\)

and is never the preferred disassembly.

**Assembler symbols**

\(<\text{Zdn}>\)  Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

\(<\text{T}>\)  Is the size specifier, encoded in the "imm13<12>:imm13<5:0>" field. It can have the following values:

- **S**  when \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 0xxxx\)
- **H**  when \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 10xxxx\)
- **B**  when \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 110xxx\)
- **B**  when \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 1110xx\)
- **B**  when \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 11110x\)
- **D**  when \(\text{imm13}<12> = 1, \text{imm13}<5:0> = xxxxxx\)

The following encodings are reserved:

- \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 111110\).
- \(\text{imm13}<12> = 0, \text{imm13}<5:0> = 111111\).

\(<\text{const}>\)  Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

**Operation**

The description of **AND (immediate)** gives the operational pseudocode for this instruction.
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:

- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<Zk>` is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) operand3 = Z[k, VL];
Z[dn, VL] = (operand1 AND operand3) OR (operand2 AND NOT(operand3));
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.59   BSL1N

Selects bits from the inverted first source vector where the corresponding bit in the third source vector is '1', and from the second source vector where the corresponding bit in the third source vector is '0'. The result is placed destructively in the destination and first source vector. This instruction is unpredicated.

Encoding

Decode for this encoding

Z[dn, VL] = result;

Operational information
If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.

• The MOVPRFX instruction must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.62   CDOT (indexed)

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums.

The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

- If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
- If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
- If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
- If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

The indexed form of these instructions select a single pair of complex numbers within each 128-bit segment of the second source vector as the multiplier for all pairs of complex numbers within the corresponding 128-bit segment of the first source vector. The complex number pairs within the second source vector are specified using an immediate index which selects the same complex number pair position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex number pairs per 128-bit segment, encoded in 1 or 2 bits depending on the size of the complex number pair.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.72  CMLA (indexed)

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the results in the corresponding elements of the addend vector. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

16-bit

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 16|15 14 13 12|11 10 9 | 5 4 | 0 ]
0 1 0 0 0 1 0 0 1 0 | 1 0 | 1 0 | i2 | Zm | 0 1 1 0 | rot | Zn | Zda
```

Encoding

`CMPNE <Pd>.<T>, <Pg>/Z, <Zn>.<T>, #<imm>`

Decode for this encoding

if `!HaveSVE() && !HaveSME()` then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Pd);
SVECmp op = Cmp_NE;
integer imm = SInt(imm5);
boolean unsigned = FALSE;

Assembler symbols

`<Pd>` Is the name of the destination scalable predicate register, encoded in the "Pd" field.
`<T>` Is the size specifier, encoded in the "size" field. It can have the following values:
- `B` when size = 00
- `H` when size = 01
- `S` when size = 10
- `D` when size = 11
`<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
`<Zn>` Is the name of the source scalable vector register, encoded in the "Zn" field.
`<imm>` For the equal, greater than, greater than or equal, less than, less than or equal and not equal variant: is the signed immediate operand, in the range -16 to 15, encoded in the "imm5" field.
For the higher, higher or same, lower and lower or same variant: is the unsigned immediate operand, in the range 0 to 127, encoded in the "imm7" field.

Operation for all encodings

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);

- The response of this instruction to synchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.
C8.2.77 CMPE (vectors)

Compare active signed integer elements in the first source vector being less than or equal to corresponding signed
integer elements in the second source vector, and place the boolean results of the comparison in the corresponding elements
of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N),
NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is a pseudo-instruction of the CMP<cc> (vectors) instruction. This means that:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

**Encoding**

CMPLE <Pd>.<T>, <Pg>/Z, <Zm>.<T>, <Zn>.<T>

is equivalent to

CMPGE <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

and is never the preferred disassembly.

**Assembler symbols**

<Pd>  Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Zm>  Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zn>  Is the name of the first source scalable vector register, encoded in the "Zn" field.

<T>  Is the size specifier, encoded in the "size" field. It can have the following values:

- B  when size = 00
- H  when size = 01
- S  when size = 10
- D  when size = 11

<Pg>  Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

**Operation**

The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register
    contains the same value for each execution.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.
C8.2.78  CMPLO (vectors)

Compare active unsigned integer elements in the first source vector being lower than corresponding unsigned
elements in the second source vector, and place the boolean results of the comparison in the corresponding elements
of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N),
NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is a pseudo-instruction of the CMP<cc> (vectors) instruction. This means that:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

Encoding

```

is equivalent to

```
CMPHI   <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>
```

and is never the preferred disassembly.

Assembler symbols

- `<Pd>`  Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<Zm>`  Is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<Zn>`  Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<T>`  Is the size specifier, encoded in the "size" field. It can have the following values:
  - `B` when size = 00
  - `H` when size = 01
  - `S` when size = 10
  - `D` when size = 11
- `<Pg>`  Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

Operation

The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register
    contains the same value for each execution.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its operand registers when its governing predicate register
    contains the same value for each execution.
  — The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is
dependent on the predicate register or NZCV condition flags written by this instruction might be significantly
delayed.
C8.2.79 CMPLS (vectors)

Compare active unsigned integer elements in the first source vector being lower than or same as corresponding unsigned elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is a pseudo-instruction of the CMP<cc> (vectors) instruction. This means that:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

### Encoding

CMPLS <Pd>.<T>, <Pg>/Z, <Zm>.<T>, <Zn>.<T>

is equivalent to

CMPHS   <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

and is never the preferred disassembly.

### Assembler symbols

- **<Pd>** Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- **<Zm>** Is the name of the second source scalable vector register, encoded in the "Zm" field.
- **<Zn>** Is the name of the first source scalable vector register, encoded in the "Zn" field.
- **<T>** Is the size specifier, encoded in the "size" field. It can have the following values:
  - B when size = 00
  - H when size = 01
  - S when size = 10
  - D when size = 11
- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

### Operation

The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

### Operational information

  — The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.
C8.2.80 CMPLT (vectors)

Compare active signed integer elements in the first source vector being less than corresponding signed elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is a pseudo-instruction of the CMP<cc> (vectors) instruction. This means that:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

![Encoding](image)

**Encoding**

CMPLT <Pd>.<T>, <Pg>/Z, <Zm>.<T>, <Zn>.<T>

is equivalent to

CMPGT <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

and is never the preferred disassembly.

**Assembler symbols**

- **<Pd>** Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- **<Zm>** Is the name of the second source scalable vector register, encoded in the "Zm" field.
- **<Zn>** Is the name of the first source scalable vector register, encoded in the "Zn" field.
- **<T>** Is the size specifier, encoded in the "size" field. It can have the following values:
  - **B** when size = 00
  - **H** when size = 01
  - **S** when size = 10
  - **D** when size = 11
- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

**Operation**

The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

**Operational information**

  — The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.
C8.2.81  CNOT

Logically invert the boolean value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Boolean TRUE is any non-zero value in a source, and one in a result element. Boolean FALSE is always zero.

Encoding

CNOT <Zd>.<T>, <Pg>/M, <Zn>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:
- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);

    Elem[result, e, esize] = BitCount(element)<esize-1:0>;
Z[d, VL] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.83  CNTB, CNTD, CNTH, CNTW

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then places the result in the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

<imm>  Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation for all encodings

CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
X[d, 64] = (count * imm)<63:0>;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

•  The execution time of this instruction is independent of:
   —  The values of the data supplied in any of its registers.
   —  The values of the NZCV flags.

•  The response of this instruction to asynchronous exceptions does not vary based on:
   —  The values of the data supplied in any of its registers.
   —  The values of the NZCV flags.
C8.2.84  CNTP

Counts the number of active and true elements in the source predicate and places the scalar result in the destination general-purpose register. Inactive predicate elements are not counted.

Encoding

CNTP <Xd>, <Pg>, <Pn>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Pn);
integer d = UInt(Rd);

Assembler symbols

<Xd>  Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
<Pg>  Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>  Is the name of the source scalable predicate register, encoded in the "Pn" field.
<T>  Is the size specifier, encoded in the "size" field. It can have the following values:
     B  when size = 00
     H  when size = 01
     S  when size = 10
     D  when size = 11

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(PL) operand = P[n, PL];

   if ElemP[mask, e, esize] == '1' && ElemP[operand, e, esize] == '1' then
      sum = sum + 1;
X[d, 64] = sum;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C8.2.85 COMPACT

Read the active elements from the source vector and pack them into the lowest-numbered elements of the
destination vector. Then set any remaining elements of the destination vector to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and
enabled at the current Exception level.

        bits(esize) element = Elem[operand1, e, esize];
        Elem[result, x, esize] = element;
        x = x + 1;
Z[d, VL] = result;
C8.2.86   CPY (immediate, merging)

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the
destination vector register remain unmodified.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it
may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option
is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit
value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the pseudo-instructions FMOV (zero, predicated) and MOV (immediate, predicated,
merging). The alias is always the preferred disassembly.

Encoding
CPY <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}

Decode for this encoding
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer d = UInt(Zd);
boolean merging = TRUE;
integer imm = SInt(imm8);
if sh == '1' then imm = imm << 8;

Assembler symbols

<Zd>   Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T>   Is the size specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<Pg>   Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm>   Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.
Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "sh" field. It can have the following values:

- **LSL #0** when \( \text{sh} = 0 \)
- **LSL #8** when \( \text{sh} = 1 \)

**Operation**

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) dest = Z[d, VL];
bits(VL) result;

for e = 0 to elements-1
  if Elem[mask, e, esize] == '1' then
    Elem[result, e, esize] = imm<esize-1:0>;
  elsif merging then
    Elem[result, e, esize] = Elem[dest, e, esize];
  else
    Elem[result, e, esize] = Zeros(esize);
  Z[d, VL] = result;
```

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.87  CPY (immediate, zeroing)

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the
destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it
may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option
is specified is "#<imm>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit
value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias MOV (immediate, predicated, zeroing). The alias is always the preferred
disassembly.

```
|31 30 29 28|27 26 25 24|23 22 21 20|19 16|15 14 13 12| 5  4 | 0 |
|0 0 0 0 0 1 0 1|size 0 1|Pg 0 0 sh|imm8|Zd|
```

**Encoding**

CPY <Zd>.<T>, <Pg>./Z, #<imm>{, <shift>}

**Decode for this encoding**

```java
if !HaveSVE() && !HaveSME() then UNDEFINED;

  elsif merging then
    Elem[result, e, esize] = Elem[dest, e, esize];
  else
    Elem[result, e, esize] = Zeros(esize);
  Z[d, VL] = result;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its operand registers when its governing predicate register
    contains the same value for each execution.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its operand registers when its governing predicate register
    contains the same value for each execution.
  — The values of the NZCV flags.
**C8.2.88 CPY (scalar)**

Copy the general-purpose scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias MOV (scalar, predicated). The alias is always the preferred disassembly.

**Encoding**

CPY <Zd>.<T>, <Pg>/M, <R><n|SP>

**Decode for this encoding**

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Rn);
integer d = UInt(Zd);

**Assembler symbols**

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<R> Is a width specifier, encoded in the "size" field. It can have the following values:

- W when size = 01
- W when size = x0
- X when size = 11

<n|SP> Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

**Operation**

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) result = Z[d, VL];
if AnyActiveElement(mask, esize) then
  bits(64) operand1;
  if n == 31 then
    operand1 = SP[];
  else
operand1 = X[n, 64];

for e = 0 to elements-1
  if Elem[ mask, e, esize] == '1'
    Elem[ result, e, esize] = operand1<esize-1:0>;

Z[d, VL] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.89   CPY (SIMD&FP scalar)

Copy the SIMD & floating-point scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias MOV (SIMD&FP scalar, predicated). The alias is always the preferred disassembly.

Encoding

```
CPY <Zd>.<T>, <Pg>/M, <V><n>
```

Decode for this encoding

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Vn);
integer d = UInt(Zd);
```

Assembler symbols

- `<Zd>`: Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>`: Is the size specifier, encoded in the "size" field. It can have the following values:
  - B when size = 00
  - H when size = 01
  - S when size = 10
  - D when size = 11
- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<V>`: Is a width specifier, encoded in the "size" field. It can have the following values:
  - B when size = 00
  - H when size = 01
  - S when size = 10
  - D when size = 11
- `<n>`: Is the number [0-31] of the source SIMD&FP register, encoded in the "Vn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(esize) operand1 = if AnyActiveElement(mask, esize) then V[n, esize] else Zeros(esize);
bits(VL) result = Z[d, VL];
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    [31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 10 9 8 7 6 5 4 0]
    0 0 0 0 1 0 1 | 1 0 0 0 0 1 0 0 | Pg | Vn | Zd
```
Elt[\text{result, e, esize}] = \text{operand1};
Z[d, \text{VL}] = \text{result};

Operational information

If \text{FEAT\_SVE2} is implemented or \text{FEAT\_SME} is implemented, then when \text{PSTATE.DIT} is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.90 CTERMEQ, CTERMNE

Detect termination conditions in serialized vector loops. Tests whether the comparison between the scalar source operands holds true and if not tests the state of the !LAST condition flag (C) which indicates whether the previous flag-setting predicate instruction selected the last element of the vector partition.

The Z and C condition flags are preserved by this instruction. The N and V condition flags are set as a pair to generate one of the following conditions for a subsequent conditional instruction:

<table>
<thead>
<tr>
<th>Condition</th>
<th>N</th>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GE</td>
<td>0</td>
<td>0</td>
<td>Continue loop (compare failed and last element not selected)</td>

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

•    The execution time of this instruction is independent of:
    —    The values of the data supplied in any of its registers.
    —    The values of the NZCV flags.

•    The response of this instruction to asynchronous exceptions does not vary based on:
    —    The values of the data supplied in any of its registers.
    —    The values of the NZCV flags.
C8.2.91   DECB, DECD, DECH, DECW (scalar)

Determines the number of active elements implied by the named predicate constraint, multiplies that by an
immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

• A fixed number (VL1 to VL256)
• The largest power of two (POW2)
• The largest multiple of three or four (MUL3 or MUL4)
• All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than
Undefined Instruction exception.

</table>
```

**Encoding**

DECP <Xdn>, <Pm>.<T>

**Decode for this encoding**

```c
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
```

**Assembler symbols**

- `<Xdn>` Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- `<Pm>` Is the name of the source scalable predicate register, encoded in the "Pm" field.
- `<T>` Is the size specifier, encoded in the "size" field. It can have the following values:
  - B when size = 00
  - H when size = 01
  - S when size = 10
  - D when size = 11

**Operation**

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(64) operand1 = X[dn, 64];
bits(PL) operand2 = P[m, PL];
integer count = 0;
for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1' then
    count = count + 1;
X[dn, 64] = operand1 - count;
```

**Operational information**

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C8.2.94   DECP (vector)

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

Encoding

DECP <Zdn>.<T>, <Pm>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = $ << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Zdn);

Assembler symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
<T>   Is the size specifier, encoded in the "size" field. It can have the following values:
   H    when size = 01
   S    when size = 10
   D    when size = 11
The encoding size = 00 is reserved.
<Pm>  Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(PL) operand2 = P[m, PL];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
   if Elem[operand2, e, esize] == '1' then
      count = count + 1;
for e = 0 to elements-1
   Elem[result, e, esize] = Elem[operand1, e, esize] - count;
Z[dn, VL] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.95    DUP (immediate)

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the pseudo-instructions FMOV (zero, unpredicated) and MOV (immediate, unpredicated). The alias is always the preferred disassembly.

Encoding

DUP <Zd>.<T>, #<imm>{, <shift>}

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer d = UInt(Zd);
integer imm = SInt(imm8);
if sh == '1' then imm = imm << 8;

Alias conditions

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>FMOV (zero, unpredicated)</td>
<td>Never</td>
</tr>
<tr>
<td>MOV (immediate, unpredicated)</td>
<td>Unconditionally</td>
</tr>
</tbody>
</table>

Assembler symbols

<Zd>    Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T>    Is the size specifier, encoded in the "size" field. It can have the following values:
B    when size = 00
H    when size = 01
S    when size = 10
D    when size = 11
<imm>    Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.
<shift>    Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "sh" field. It can have the following values:
LSL #0    when sh = 0
LSL #8 when sh = 1

**Operation**

CheckSVEEnabled();

constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;

bits(VL) result = Replicate(imm<esize-1:0>, VL DIV esize);

Z\[d, VL\] = result;

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.96  DUP (indexed)

Unconditionally broadcast the indexed source vector element into each element of the destination vector. This instruction is unpredicated.

The immediate element index is in the range of 0 to 63 (bytes), 31 (halfwords), 15 (words), 7 (doublewords) or 3 (quadwords). Selecting an element beyond the accessible vector length causes the destination vector to be set to zero.

This instruction is used by the alias MOV (SIMD&FP scalar, unpredicated). See Alias conditions for details of when each alias is preferred.

Encoding

DUP <Zd>.<T>, <Zn>.<T>[<imm>]

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
b_bits(7) imm = imm2:tsz;
integer esize;
integer index;
case tsz of
  when '00000' UNDEFINED;
  when '10000' esize = 128; index = UInt(imm<6:5>);
  when 'x1000' esize = 64;  index = UInt(imm<6:4>);
  when 'xx100' esize = 32;  index = UInt(imm<6:3>);
  when 'xxx10' esize = 16;  index = UInt(imm<6:2>);
  when 'xxxx1' esize = 8;   index = UInt(imm<6:1>);
integer n = UInt(Zn);
integer d = UInt(Zd);

<tr>
<td>Q</td>
<td>when tsz = 10000</td>
</tr>
</tbody>
</table>

The encoding tsz = 00000 is reserved.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> Is the immediate index, in the range 0 to one less than the number of elements in 512 bits, encoded in "imm2:tsz".

**Operation**

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) result;
bits(esize) element;
if index >= elements then
    element = Zeros(esize);
else
    element = Elem[operand1, index, esize];
result = Replicate(element, VL DIV esize);
Z[d, VL] = result;
```

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.97 DUP (scalar)

Unconditionally broadcast the general-purpose scalar source register into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias MOV (scalar, unpredicated). The alias is always the preferred disassembly.

Encoding

DUP <Zd>.,<T>, <R><n|SP>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Rn);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in the "size" field. It can have the following values:
B when size = 00
H when size = 01
S when size = 10
D when size = 11
<R> Is a width specifier, encoded in the "size" field. It can have the following values:
W when size = 01
W when size = x0
X when size = 11

<n|SP> Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer PL = VL DIV 8;
bits(64) operand;
if n == 31 then
    operand = SP[];
else
    operand = X[n, 64];
bits(VL) result;
for e = 0 to elements-1
    Elem[result, e, esize] = operand<esize-1:0>;
$Z[d, \text{VL}] = \text{result}$

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.98   DUPM

Unconditionally broadcast the logical bitmask immediate into each element of the destination vector. This instruction is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits.

This instruction is used by the alias MOV. See Alias conditions for details of when each alias is preferred.

Assembler symbols

<Zd>  Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T>  Is the size specifier, encoded in the "imm13<12>:imm13<5:0>" field. It can have the following values:

- **S**  when imm13<12> = 0, imm13<5:0> = 0xxxxx
- **H**  when imm13<12> = 0, imm13<5:0> = 10xxxx
- **B**  when imm13<12> = 0, imm13<5:0> = 110xx
- **B**  when imm13<12> = 0, imm13<5:0> = 1110x
- **D**  when imm13<12> = 1, imm13<5:0> = xxxxxx

The following encodings are reserved:

- · imm13<12> = 0, imm13<5:0> = 111110.
- · imm13<12> = 0, imm13<5:0> = 111111.

<const>  Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.
Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
bits(VL) result = Replicate(imm, VL DIV esize);
Z[d, VL] = result;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C8.2.99  EON

Bitwise exclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is a pseudo-instruction of the EOR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of EOR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of EOR (immediate) gives the operational pseudocode for this instruction.

<table>

<td></td>
</tr>
</tbody>
</table>

**Encoding**

EON <Zdn>,<T>, <Zdn>,<T>, #<const>

is equivalent to

EOR <Zdn>,<T>, <Zdn>,<T>, #(-<const> - 1)

and is never the preferred disassembly.

**Assembler symbols**

- `<Zdn>` is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in the "imm13<12>:imm13<5:0>" field. It can have the following values:
  - `S` when imm13<12> = 0, imm13<5:0> = 0xxxxx
  - `H` when imm13<12> = 0, imm13<5:0> = 10xxxx
  - `B` when imm13<12> = 0, imm13<5:0> = 110xxx
  - `B` when imm13<12> = 0, imm13<5:0> = 1110xx
  - `B` when imm13<12> = 0, imm13<5:0> = 11110x
  - `D` when imm13<12> = 1, imm13<5:0> = xxxxxx

The following encodings are reserved:

- imm13<12> = 0, imm13<5:0> = 111110.
- imm13<12> = 0, imm13<5:0> = 111111.

- `<const>` is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

**Operation**

The description of EOR (immediate) gives the operational pseudocode for this instruction.
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.

- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.100  EOR (immediate)

Bitswise exclusive OR an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction **EON**. The pseudo-instruction is never the preferred disassembly.

![Encoding Table]

**Encoding**

EOR <Zdn>,<T>, <Zdn>,<T>, #<const>

**Decode for this encoding**

if !HaveSVE() && !HaveSME() then UNDEFINED;
integer dn = UInt(Zdn);
bits(64) imm;
(imm, -) = DecodeBitMasks(imm13<12>, imm13<5:0>, imm13<11:6>, TRUE, 64);

**Assembler symbols**

<Zdn>  
Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T>  
Is the size specifier, encoded in the "imm13<12>:imm13<5:0>" field. It can have the following values:
- S when imm13<12> = 0, imm13<5:0> = 0xxxxx
- H when imm13<12> = 0, imm13<5:0> = 10xxxx
- B when imm13<12> = 0, imm13<5:0> = 110xxx
- B when imm13<12> = 0, imm13<5:0> = 1110xx
- B when imm13<12> = 0, imm13<5:0> = 11110x
- D when imm13<12> = 1, imm13<5:0> = xxxxxx

The following encodings are reserved:
- imm13<12> = 0, imm13<5:0> = 111110.
- imm13<12> = 0, imm13<5:0> = 111111.

<const>  
Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

**Operation**

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV 64;
bits(VL) operand = Z[dn, VL];
bits(VL) result;
for e = 0 to elements-1
  bits(64) element1 = Elem[operand, e, 64];
  Elem[result, e, 64] = element1 EOR imm;
$Z[dn, VL] = \text{result};$

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.101   EOR (predicates)

Bitwise exclusive OR active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This instruction is used by the alias NOT (predicate). See Alias conditions for details of when each alias is preferred.

```
else
    ElemP[result, e, esize] = '0';

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d, PL] = result;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  — The values of the NZCV flags.
C8.2.102  EOR (vectors, predicated)

Bitwise exclusive OR active elements of the second source vector with corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Encoding

EOR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);

Assembler symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

B  when size = 00
H  when size = 01
S  when size = 10
D  when size = 11

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);

  if Elem[mask, e, esize] == '1' then
    Elem[result, e, esize] = element1 EOR element2;
  else
    Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn, VL] = result;
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.103  EOR (vectors, unpredicated)

Bitwise exclusive OR all elements of the second source vector with corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
[31 30 29 28|27 26 25 24|23 22 21 20] 16|15 14 13 12|11 10 9 |  5 4  |  0 |
  0 0 0 0 0 1 0 0 | 0 1 0 1 | Zm  | 0 0 1 1 0 0 | Zn  | Zd  
```

**Encoding**

EOR <Zd>.D, <Zn>.D, <Zm>.D

**Decode for this encoding**

```c
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

**Assembler symbols**

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
Z[d, VL] = operand1 EOR operand2;
```

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
C8.2.104   EOR3

Bitwise exclusive OR the corresponding elements of all three source vectors, and destructively place the results in the corresponding elements of the destination and first source vector. This instruction is unpredicated.

Encoding

Decode for this encoding

if !HaveSVE2() && !HaveSME() then UNDEFINED;
integer m = UInt(Zm);
integer k = UInt(Zk);
integer dn = UInt(Zdn);

Assembler symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zk> Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
bite(VL) operand1 = Z[dn, VL];
bite(VL) operand2 = Z[m, VL];
bite(VL) operand3 = Z[k, VL];
Z[dn, VL] = operand1 EOR operand2 EOR operand3;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.105   EORBT

Interleaving exclusive OR between the even-numbered elements of the first source vector register and the odd-numbered elements of the second source vector register, placing the result in the even-numbered elements of the destination vector, leaving the odd-numbered elements unchanged. This instruction is unpredicated.

```
[31 30 29 28|27 26 25 24|23 22 21 20] 16|15 14 13 12|11 10 9 | 5 4 | 0 |  
0 1 0 0 0 1 0 1 | size 0 | Zm 1 0 0 1 0 | 0 | Zn | Zd  
```

Encoding

EORBT <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

Decode for this encoding

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer sel1 = 0;
integer sel2 = 1;
```

Assembler symbols

<Zd>  Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T>  Is the size specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<Zn>  Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm>  Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV (2 * esize);
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result = Z[d, VL];
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, 2*e + sel1, esize];
bits(esize) element2 = Elem[operand2, 2*e + sel2, esize];
    Elem[result, 2*e + sel1, esize] = element1 EOR element2;
Z[d, VL] = result;
```
Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
C8.2.109   EXT

Copy the indexed byte up to the last byte of the first source vector to the bottom of the result vector, then fill the
remainder of the result starting from the first byte of the second source vector. The result is placed destructively in
the destination and first source vector, or constructively in the destination vector. This instruction is unpredicated.

An index that is greater than or equal to the vector length in bytes is treated as zero, resulting in the first source
vector being copied to the result unchanged.

The Destructive encoding of this instruction might be immediately preceded in program order by a MOVPRFX
instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior
of the MOVPRFX and this instruction is UNPREDICTABLE: The MOVPRFX instruction must be unpredicated.
The MOVPRFX instruction must specify the same destination register as this instruction. The destination register
must not refer to architectural register state referenced by any other source operand register of this instruction.

Constructive

and is never the preferred disassembly.

Assembler symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10
- D when size = 11

The encoding size = 00 is reserved.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

Operation

The description of FAC<cc> gives the operational pseudocode for this instruction.

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register written by this instruction might be significantly delayed.
C8.2.115  FADD (immediate)

Add an immediate to each active floating-point element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate may take the value +0.5 or +1.0 only. Inactive elements in the destination vector register remain unmodified.

Encoding

FADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <const>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
bits(esize) imm = if i1 == '0' then FPPointFive('0', esize) else FPOne('0', esize);

Assembler symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
<T> Is the size specifier, encoded in the "size" field. It can have the following values:
    H when size = 01
    S when size = 10
    D when size = 11
The encoding size = 00 is reserved.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<const> Is the floating-point immediate value, encoded in the "i1" field. It can have the following values:
    #0.5 when i1 = 0
    #1.0 when i1 = 1

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];

    else
        Elem[result, e, esize] = element1;
Z[dn, VL] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.116 FADD (vectors, predicated)

Add active floating-point elements of the second source vector to corresponding floating-point elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Encoding

FADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;

constant integer PL = VL DIV 8;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(esize) identity = FPZero('0', esize);
V[d, esize] = ReducePredicated(ReduceOp_FADD, operand, mask, identity);
```
C8.2.121 FCADD

Add the real and imaginary components of the active floating-point complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by \( \pm j \) beforehand. Destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register written by this instruction might be significantly delayed.
C8.2.124   FCMLA (indexed)

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

The complex numbers within the second source vector are specified using an immediate index which selects the same complex number position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex numbers per 128-bit segment, encoded in 1 to 2 bits depending on the size of the complex number. This instruction is unpredicated.

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.126  FCMLE (vectors)

Compare active floating-point elements in the first source vector being less than or equal to corresponding elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This instruction is a pseudo-instruction of the FCM<cc> (vectors) instruction. This means that:

- The encodings in this description are named to match the encodings of FCM<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of FCM<cc> (vectors) gives the operational pseudocode for this instruction.

### Encoding

FCMLE <Pd>.<T>, <Pg>/Z, <Zm>.<T>, <Zn>.<T>

is equivalent to

FCMGE <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

and is never the preferred disassembly.

### Assembler symbols

- `<Pd>` is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<Zn>` is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<T>` is the size specifier, encoded in the "size" field. It can have the following values:
  - `H` when size = 01
  - `S` when size = 10
  - `D` when size = 11
  - The encoding size = 00 is reserved.
- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

### Operation

The description of FCM<cc> (vectors) gives the operational pseudocode for this instruction.

### Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register written by this instruction might be significantly delayed.
C8.2.127   FCMLT (vectors)

Compare active floating-point elements in the first source vector being less than corresponding elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This instruction is a pseudo-instruction of the FCM<cc> (vectors) instruction. This means that:

- The encodings in this description are named to match the encodings of FCM<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of FCM<cc> (vectors) gives the operational pseudocode for this instruction.

**Encoding**

FCMLT <Pd>.<T>, <Pg>/Z, <Zm>.<T>, <Zn>.<T>

is equivalent to

FCMGT   <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

and is never the preferred disassembly.

**Assembler symbols**

- <Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.
- <Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
- <T> Is the size specifier, encoded in the "size" field. It can have the following values:
  - H when size = 01
  - S when size = 10
  - D when size = 11
  
  The encoding size = 00 is reserved.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

**Operation**

The description of FCM<cc> (vectors) gives the operational pseudocode for this instruction.

**Operational information**

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register written by this instruction might be significantly delayed.
C8.2.128   FCPY

Copy a floating-point immediate into each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias FMOV (immediate, predicated). The alias is always the preferred disassembly.

Encoding

FCPY <Zd>.<T>, <Pg>/M, #<const>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = $ << UInt(size);
ing = UInt(Pg);
d = UInt(Zd);
bits(esize) imm = VFPExpandImm(imm8, esize);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

H when size = 01
S when size = 10
D when size = 11

The encoding size = 00 is reserved.

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<const> Is a floating-point immediate value expressable as ±n\times16\times2^{r}, where n and r are integers such that 16 \leq n \leq 31 and -3 \leq r \leq 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) result = Z[d, VL];
for e = 0 to elements-1
   if Elem[mask, e, esize] == '1' then
      Elem[result, e, esize] = imm;
   Z[d, VL] = result;
**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is **UNPREDICTABLE**:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.129 FCVT

Convert the size and precision of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

**Encoding**

FCVTLT `<Zd>.S`, `<Pg>/M`, `<Zn>.H

**Decode for this encoding**

```c
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

### Single-precision to double-precision

![Encoding](image)

**Encoding**

FCVTLT `<Zd>.D`, `<Pg>/M`, `<Zn>.S

**Decode for this encoding**

```c
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

**Assembler symbols**

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zn>` Is the name of the source scalable vector register, encoded in the "Zn" field.

**Operation for all encodings**

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
```
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
  if Elem[mask, e, esize] == '1' then
    bits(esize DIV 2) element = Elem[operand, 2*e + 1, esize DIV 2];
    Elem[result, e, esize] = FPConvertSVE(element, FPCR[], esize);
  
Z[d, VL] = result;
C8.2.131 FCVTNT

Convert active floating-point elements from the source vector to the next lower precision, and place the results in the odd-numbered half-width elements of the destination vector, leaving the even-numbered elements unchanged. Inactive elements in the destination vector register remain unmodified.

**Single-precision to half-precision**

```

    Elem[result, e, esize] = element1;
Z[dn, VL] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.137   FDIVR

Reversed divide active floating-point elements of the second source vector by corresponding floating-point
elements of the first source vector and destructively place the quotient in the corresponding elements of the first
source vector. Inactive elements in the destination vector register remain unmodified.

Encoding

FDIVR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

Decode for this encoding

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
```

Assembler symbols

- `<Zdn>` is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in the "size" field. It can have the following values:
  - H when size = 01
  - S when size = 10
  - D when size = 11

The encoding size = 00 is reserved.

- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  if Elem[mask, e, esize] == '1' then
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPDiv(element2, element1, FPCR[]);
  else
    Elem[result, e, esize] = element1;
Z[dn, VL] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

• The MOVPRFX instruction must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.138 FDUP

Unconditionally broadcast the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias FMOV (immediate, unpredicated). The alias is always the preferred disassembly.

```
[31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12] | 5 4 | 0 |
0 0 1 0 0 1 0 1 | size | 1 1 1 | 0 0 1 1 1 0 | imm8 | Zd
```

**Encoding**

FDUP <Zd>,<T>, #<const>

**Decode for this encoding**

```java
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = $ << UInt(size);
integer d = UInt(Zd);
bits(esize) imm = VFPExpandImm(imm8, esize);
```

**Assemble symbols**

- `<Zd>`: Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>`: Is the size specifier, encoded in the "size" field. It can have the following values:
  - H when size = 01
  - S when size = 10
  - D when size = 11
  - The encoding size = '00' is reserved.
- `<const>`: Is a floating-point immediate value expressable as ±n×16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

**Operation**

```java
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) result;
for e = 0 to elements-1
  Elem[result, e, esize] = imm;
Z[d, VL] = result;
```
C8.2.139 FEXPA

The FEXPA instruction accelerates the polynomial series calculation of the EXP(X) function.

The double-precision variant copies the low 52 bits of an entry from a hard-wired table of 64-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 11 bits of the source element (src<16:6>), setting the sign bit to zero.

The single-precision variant copies the low 23 bits of an entry from hard-wired table of 32-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 8 bits of the source element (src<13:6>), setting the sign bit to zero.

The half-precision variant copies the low 10 bits of an entry from hard-wired table of 16-bit coefficients, indexed by the low 5 bits of each element of the source vector, and prepends to that the next 5 bits of the source element (src<9:5>), setting the sign bit to zero.

A coefficient table entry with index m holds the floating-point value $2^{(m/64)}$, or for the half-precision variant $2^{(m/32)}$. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

```
[31 30 29 28] [27 26 25 24] [23 22 21 20] [19 18 17 16] [15 14 13 12] [11 10 9]  5  4  0

```

Encoding

FEXPA <Zd>.<T>, <Zn>.<T>

Decode for this encoding

```plaintext
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = $ << UInt(size);
n = UInt(Zn);
d = UInt(Zd);
```

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- H when size == 01
- S when size == 10
- D when size == 11

The encoding size == 00 is reserved.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```plaintext
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand = Z[n, VL];
```
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPExpA(element);

Z[d, VL] = result;
C8.2.140  FLOGB

This instruction returns the signed integer base 2 logarithm of each floating-point input element |X| after normalization.

This is the unbiased exponent of X used in the representation of the floating-point value, such that, for positive X, X = significand × 2^{exponent}.

The integer results are placed in elements of the destination vector which have the same width (ESIZE) as the floating-point input elements:

- If X is normal, the result is the base 2 logarithm of X.
- If X is subnormal, the result corresponds to the normalized representation.
- If X is infinite, the result is 2^{(esize-1)}-1.
- If X is ±0.0 or NaN, the result is -2^{(esize-1)}.

Inactive elements in the destination vector register remain unmodified.

Encoding

FLOGB <Zd>.<T>, <Pg>/M, <Zn>.<T>

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
  H when size = 01
  S when size = 10
  D when size = 11
The encoding size = 00 is reserved.
<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.
<T> Is the size specifier, encoded in the "size" field. It can have the following values:
  H when size = 01
  S when size = 10
  D when size = 11
The encoding size = 00 is reserved.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(esize) identity = FPInfinity('0', esize);
V[d, esize] = ReducePredicated(ReduceOp_FMIN, operand, mask, identity);
C8.2.158  FMLA (indexed)

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.170  FMMMA

The floating-point matrix multiply-accumulate instruction supports single-precision and double-precision data types in a 2×2 matrix contained in segments of 128 or 256 bits, respectively. It multiplies the 2×2 matrix in each segment of the first source vector by the 2×2 matrix in the corresponding segment of the second source vector. The resulting 2×2 matrix product is then destructively added to the matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element. This instruction is unpredicated. The single-precision variant is vector length agnostic. The double-precision variant requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID_AA64ZFR0_EL1.F32MM indicates whether the single-precision variant is implemented.

ID_AA64ZFR0_EL1.F64MM indicates whether the double-precision variant is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

32-bit element

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.171 FMOV (immediate, predicated)

Move a floating-point immediate into each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is an alias of the FCPY instruction. This means that:

- The encodings in this description are named to match the encodings of FCPY.
- The description of FCPY gives the operational pseudocode for this instruction.

```
| 31 30 29 28|27 26 25 24|23 22 21 20|19 16|15 14 13 12| 5 4 | 0 |
| 0 0 0 0 0 1 0 1 | size | 0 1 | Pg | 1 1 0 | imm8 | Zd |
```

**Encoding**

FMOV <Zd>,<T>, <Pg>/M, #<const>

is equivalent to

FCPY <Zd>,<T>, <Pg>/M, #<const>

and is always the preferred disassembly.

**Assembler symbols**

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>` Is the size specifier, encoded in the "size" field. It can have the following values:
  - `H` when size = 01
  - `S` when size = 10
  - `D` when size = 11
  - The encoding size = 00 is reserved.
- `<Pg>` Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<const>` Is a floating-point immediate value expressable as ±n÷16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

**Operation**

The description of FCPY gives the operational pseudocode for this instruction.

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.172   FMOV (immediate, unpredicated)

Unconditionally broadcast the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This instruction is an alias of the FDUP instruction. This means that:

- The encodings in this description are named to match the encodings of FDUP.
- The description of FDUP gives the operational pseudocode for this instruction.

| 31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12| 5  4  0 | 0 1 0 0 1 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 0 0 |

Encoding

FMOV <Zd>,<T>, #<const>

is equivalent to

FDUP    <Zd>,<T>, #<const>

and is always the preferred disassembly.

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10
- D when size = 11

The encoding size = 00 is reserved.

<const> Is a floating-point immediate value expressable as ±n×16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

The description of FDUP gives the operational pseudocode for this instruction.
Move floating-point constant +0.0 to to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is a pseudo-instruction of the CPY (immediate, merging) instruction. This means that:

- The encodings in this description are named to match the encodings of CPY (immediate, merging).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

The encoding

\[
\begin{array}{cccccccccc}
\text{size} & \text{Pg} & \text{M} & \text{sh} & \text{imm8} \\
0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\end{array}
\]

is equivalent to

\[
\text{CPY} \ <Zd>.<T>, \ <Pg>/M, \ #0, \#0
\]

and is never the preferred disassembly.

**Assembler symbols**

- \(<Zd>\) is the name of the destination scalable vector register, encoded in the "Zd" field.
- \(<T>\) is the size specifier, encoded in the "size" field. It can have the following values:
  - \(H\) when \(\text{size} = 01\)
  - \(S\) when \(\text{size} = 10\)
  - \(D\) when \(\text{size} = 11\)
  - The encoding \(\text{size} = 00\) is reserved.
- \(<Pg>\) is the name of the governing scalable predicate register, encoded in the "Pg" field.

**Operation**

The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.174  FMOV (zero, unpredicated)

Unconditionally broadcast the floating-point constant +0.0 into each element of the destination vector. This instruction is unpredicated.

This instruction is a pseudo-instruction of the DUP (immediate) instruction. This means that:

• The encodings in this description are named to match the encodings of DUP (immediate).
• The assembler syntax is used only for assembly, and is not used on disassembly.
• The description of DUP (immediate) gives the operational pseudocode for this instruction.

Encoding

FMOV <Zd>.<T>, #0.0

is equivalent to

DUP <Zd>.<T>, #0

and is never the preferred disassembly.

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in the "size" field. It can have the following values:

<table>
<thead>
<tr>
<th>H</th>
<th>when size = 01</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>when size = 10</td>
</tr>
<tr>
<td>D</td>
<td>when size = 11</td>
</tr>
</tbody>
</table>

The encoding size = 00 is reserved.

Operation

The description of DUP (immediate) gives the operational pseudocode for this instruction.

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
C8.2.175  FMSB

Multiply the corresponding active floating-point elements of the first and second source vectors and subtract from elements of the third (addend) vector without intermediate rounding. Destructively place the results in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

Encoding

FMSB <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Za>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;

Assembler symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:
  
  H when size = 01
  S when size = 10
  D when size = 11
  
  The encoding size = 00 is reserved.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the floating-point immediate value, encoded in the "i1" field. It can have the following values:
  
  #0.5 when i1 = 0
  #2.0 when i1 = 1

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPMul(element1, imm, FPCR[]);
  else
    Elem[result, e, esize] = element1;

\[ Z[dn, VL] = \text{result}; \]

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.177 FMUL (indexed)

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

**Half-precision**

else
    Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn, VL] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.186  FRECPE

Find the approximate reciprocal of each floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

\[
\begin{array}{cccccccccccccccccccccc}
0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & Zn & Zd
\end{array}
\]

Encoding

FRECPE <Zd>.<T>, <Zn>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
n = UInt(Zn);
d = UInt(Zd);

Assembler symbols

<Zd>  Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T>  Is the size specifier, encoded in the "size" field. It can have the following values:

H     when size = 01
S     when size = 10
D     when size = 11

The encoding size = 00 is reserved.

<Zn>  Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
const integer VL = CurrentVL;
const integer PL = VL DIV 8;
const integer elements = VL DIV esize;
bits(VL) operand = Z[n, VL];
bits(VL) result;
for e = 0 to elements-1

Encoding

FSUB <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <const>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
bits(esize) imm = if i1 == '0' then FPPointFive('0', esize) else FPOne('0', esize);

Assembler symbols

<Zdn>  Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T>  Is the size specifier, encoded in the "size" field. It can have the following values:

H  when size = 01
S  when size = 10
D  when size = 11

The encoding size = 00 is reserved.

<Pg>  Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const>  Is the floating-point immediate value, encoded in the "i1" field. It can have the following values:

#0.5  when i1 = 0
#1.0  when i1 = 1

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;
for e = 0 to elements-1
bits(esize) element1 = Elem[operand1, e, esize];
if ElemP[mask, e, esize] == '1' then
  Elem[result, e, esize] = FPSub(element1, imm, FPCR[]);
else
  Elem[result, e, esize] = element1;
Z[dn, VL] = result;

Operational information
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.195 **FSUB (vectors, predicated)**

Subtract active floating-point elements of the second source vector from corresponding floating-point elements of
the first source vector and destructively place the results in the corresponding elements of the first source vector.
Inactive elements in the destination vector register remain unmodified.

```
31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12| 10 9 | 5 4 | 0 |
0 1 1 0 0 1 0 1 | size | 0 0 0 0 | 1 | 1 0 0 | Pg | Zm | Zdn

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.199 FTMAD

The FTMAD instruction calculates the series terms for either $\sin(X)$ or $\cos(X)$, where the argument $X$ has been adjusted to be in the range $-\pi/4 < X \leq \pi/4$.

To calculate the series terms of $\sin(X)$ and $\cos(X)$ the initial source operands of FTMAD should be zero in the first source vector and $X^2$ in the second source vector. The FTMAD instruction is then executed eight times to calculate the sum of eight series terms, which gives a result of sufficient precision.

The FTMAD instruction multiplies each element of the first source vector by the absolute value of the corresponding element of the second source vector and performs a fused addition of each product with a value obtained from a table of hard-wired coefficients, and places the results destructively in the first source vector.

The coefficients are different for $\sin(X)$ and $\cos(X)$, and are selected by a combination of the sign bit in the second source element and an immediate index in the range 0 to 7.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.200   FTSMUL

The FTSMUL instruction calculates the initial value for the FTMAD instruction. The instruction squares each element in the first source vector and then sets the sign bit to a copy of bit 0 of the corresponding element in the second source register, and places the results in the destination vector. This instruction is unpredicated.

To compute \( \sin(X) \) or \( \cos(X) \) the instruction is executed with elements of the first source vector set to \( X \), adjusted to be in the range \(-\pi/4 < X \leq \pi/4\).

The elements of the second source vector hold the corresponding value of the quadrant \( q \) number as an integer not a floating-point value. The value \( q \) satisfies the relationship \((2q-1) \times \pi/4 < X \leq (2q+1) \times \pi/4\).

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

**Encoding**

FTSMUL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

**Decode for this encoding**

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

**Assembler symbols**

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10
- D when size = 11

The encoding size = 00 is reserved.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
bits(esize) element2 = Elem[operand2, e, esize];
Elem[result, e, esize] = FPTrigSMul(element1, element2, FPCR[]);
Z[d, VL] = result;
C8.2.201 FTSSEL

The FTSSEL instruction selects the coefficient for the final multiplication in the polynomial series approximation. The instruction places the value 1.0 or a copy of the first source vector element in the destination element, depending on bit 0 of the quadrant number Q held in the corresponding element of the second source vector. The sign bit of the destination element is copied from bit 1 of the corresponding value of Q. This instruction is unpredicated.

To compute SIN(X) or COS(X) the instruction is executed with elements of the first source vector set to X, adjusted to be in the range \(-\pi/4 < X \leq \pi/4\).

The elements of the second source vector hold the corresponding value of the quadrant Q number as an integer not a floating-point value. The value Q satisfies the relationship \((2q-1) \times \pi/4 < X \leq (2q+1) \times \pi/4\).

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

Encoding

FTSSEL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

Decode for this encoding

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

H when size = 01
S when size = 10
D when size = 11

The encoding size = 00 is reserved.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];

for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  bits(esize) element2 = Elem[operand2, e, esize];
  Elem[result, e, esize] = FPTrigSSel(element1, element2);
  Z[d, VL] = result;
C8.2.202  HISTCNT

This instruction compares each active 32 or 64-bit element of the first source vector with all active elements with an element number less than or equal to its own in the second source vector, and places the count of matching elements in the corresponding element of the destination vector. Inactive elements in the destination vector are set to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

Encoding

HISTCNT <Zd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

Decode for this encoding

if !HaveSVE2() then UNDEFINED;
if size IN {'0x'} then UNDEFINED;
constant integer esize = $ << UInt(size);
integer g = UInt(Pg);
integer d = UInt(Zd);
integer n = UInt(Zn);
integer m = UInt(Zm);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in the "size<0>" field. It can have the following values:
S when size<0> = 0
D when size<0> = 1
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);

      if element1 == element2 then
        count = count + 1;
      Elem[result, e, esize] = count<esize-1:0>;
    Z[d, VL] = result;
C8.2.204  INCB, INCD, INCH, INCW (scalar)

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

- VL8 when pattern = 01000
- VL16 when pattern = 01001
- VL32 when pattern = 01010
- VL64 when pattern = 01011
- VL128 when pattern = 01100
- VL256 when pattern = 01101
- #uimm5 when pattern = 01110
- #uimm5 when pattern = 01111
- #uimm5 when pattern = 1011x
- #uimm5 when pattern = 10110
- #uimm5 when pattern = 1x01x
- #uimm5 when pattern = 1x010
- #uimm5 when pattern = 1xx00
- MUL4 when pattern = 11101
- MUL3 when pattern = 11110
- ALL when pattern = 11111
<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

**Operation for all encodings**

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] + (count * imm);
Z[dn, VL] = result;
```

**Operational information**

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.206  INCP (scalar)

Counts the number of true elements in the source predicate and then uses the result to increment the scalar destination.

Encoding

INCP <Xd>, <Pm>.<T>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);

Assembler symbols

<Xd>  Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Pm>  Is the name of the source scalable predicate register, encoded in the "Pm" field.
<T>  Is the size specifier, encoded in the "size" field. It can have the following values:

B    when size = 00
H    when size = 01
S    when size = 10
D    when size = 11

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(64) operand1 = X[dn, 64];
bits(PL) operand2 = P[m, PL];
integer count = 0;

for e = 0 to elements-1
   if ElemP[operand2, e, esize] == '1' then
      count = count + 1;
X[dn, 64] = operand1 + count;

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C8.2.207  INCP (vector)

Counts the number of true elements in the source predicate and then uses the result to increment all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 10 9 8 | 5 4 | 0 ]
0 0 1 0 0 1 0 1 | size 1 0 1 1 0 0 1 0 0 0 0 0 0 | Pm | Zdn
```

**Encoding**

INCP <Zdn>,<T>, <Pm>,<T>

**Decode for this encoding**

```c
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = size << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Zdn);
```

**Assembler symbols**

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:

H when size = 01
S when size = 10
D when size = 11

The encoding size = 00 is reserved.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

**Operation**

```c
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(PL) operand2 = P[m, PL];
bits(VL) result;

Z[dn, VL] = result;
```
**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is **UNPREDICTABLE**:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.208   INDEX (immediate, scalar)

Populates the destination vector by setting the first element to the first signed immediate integer operand and monotonically incrementing the value by the second signed scalar integer operand for each subsequent element. The scalar source operand is a general-purpose register in which only the least significant bits corresponding to the vector element size are used and any remaining bits are ignored. This instruction is unpredicated.

Encoding

INDEX <Zd>.<T>, #<imm>, <R><m>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Rm);
integer d = UInt(Zd);
integer imm = SInt(imm5);

Assembler symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:
B when size = 00
H when size = 01
S when size = 10
D when size = 11

<imm> Is the signed immediate operand, in the range -16 to 15, encoded in the "imm5" field.

<R> Is a width specifier, encoded in the "size" field. It can have the following values:
W when size = 01
W when size = x0
X when size = 11

<m> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(esize) operand2 = X[m, esize];
integer element2 = SInt(operand2);

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.213 INSR (SIMD&FP scalar)

Shift the destination vector left by one element, and then place a copy of the SIMD&FP scalar register in element 0 of the destination vector. This instruction is unpredicated.

Encoding

INSR <Zdn>.<T>, <V><m>

Decode for this encoding

if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer m = UInt(Vm);

Assembler symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in the "size" field. It can have the following values:
- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
- B when size = 00
- H when size = 01
- S when size = 10
- D when size = 11

<m> Is the number [0-31] of the source SIMD&FP register, encoded in the "Vm" field.

Operation

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(VL) dest = Z[dn, VL];
bits(esize) src = V[m, esize];
Z[dn, VL] = dest<(VL-esize)-1:0> : src;

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
— The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
C8.2.214 LASTA (scalar)

If there is an active element then extract the element after the last active element modulo the number of elements from the final source vector register. If there are no active elements, extract element zero. Then zero-extend and place the extracted element in the destination general-purpose register.

Encoding

```
0 0 0 0 0 1 0 1 | 1 0 0 0 0 0 1 0 1 |
0 0 0 0 0 1 0 1 | size 1 0 0 0 0 0 | Pg Zn Rd
```

```
B
```

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = Z[n, VL];
bits(rsize) result;
integer last = LastActiveElement(mask, esize);
if isBefore then
```
if last < 0 then last = elements - 1;
else
    last = last + 1;
if last >= elements then last = 0;
result = ZeroExtend(Elem[operand, last, esize], rsize);
X[d, rsize] = result;

**Operational information**

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.
C8.2.215   LASTA (SIMD&FP scalar)

If there is an active element then extract the element after the last active element modulo the number of elements from the final source vector register. If there are no active elements, extract element zero. Then place the extracted element in the destination SIMD&FP scalar register.

Encoding

C8.2.227  LD1H (scalar plus scalar)

Contiguous load of unsigned halfwords to elements of a vector register from the memory address generated by a
64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access
the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from
Device memory or signal a fault, and are set to zero in the destination vector.

Load a single doubleword from a memory address generated by a 64-bit scalar base address plus an immediate offset which is a multiple of 8 in the range 0 to 504.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

Z[t, VL] = ZeroExtend(Replicate(result, VL DIV 256), VL);
C8.2.239  **LD1ROW (scalar plus immediate)**

Load eight contiguous words to elements of a 256-bit (octaword) vector from the memory address generated by a
64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base
address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current
vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing
bits in the destination vector are set to zero.

Only the first eight predicate elements are used and higher numbered predicate elements are ignored.

ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and
enabled at the current Exception level.

C8.2.255   LD1SB (scalar plus vector)

Gather load of signed bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

32-bit unpacked unscaled offset

Z[t, VL] = result;
C8.2.268   LD1W (vector plus immediate)

Gather load of unsigned words to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

32-bit element

Encoding
LD1W { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]

Decode for this encoding
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 32;
boolean unsigned = TRUE;
integer offset = UInt(imm5);

64-bit element

Encoding
LD1W { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]

Decode for this encoding
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 32;
boolean unsigned = TRUE;
integer offset = UInt(imm5);

Assembler symbols

<Zt>  Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pp> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.

<imm> Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.

**Operation for all encodings**

```c
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];

C8.2.277   LD3B (scalar plus immediate)

Contiguous load three-byte structures, each to the same element number in three vector registers from the memory
address generated by a 64-bit scalar base and an immediate index which is a multiple of 3 in the range -24 to 21 that
is multiplied by the vector's in-memory size, irrespective of predication,

Each predicate element applies to the same element number in each of the three vector registers, or equivalently to
the three consecutive bytes in memory which make up each structure. Inactive elements will not cause a read from
Device memory or signal a fault, and the corresponding element is set to zero in each of the three destination vector
registers.

### LDFF1H (scalar plus scalar)

Contiguous load with first-faulting behavior of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

C8.2.303  LDFF1SB (scalar plus vector)

Gather load with first-faulting behavior of signed bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.
